Description of STM32N6 HAL and low-layer drivers

Introduction

STM32Cube is an STMicroelectronics original initiative to significantly improve developer productivity by reducing development effort, time, and cost. STM32Cube covers the STM32 portfolio.

STM32Cube includes:

- STM32CubeMX, a graphical software configuration tool that allows the generation of C initialization code using graphical wizards.
- A comprehensive embedded software platform, delivered per series (such as STM32CubeN6 for STM32N6 devices)
  - The STM32Cube HAL, STM32 abstraction layer embedded software ensuring maximized portability across the STM32 portfolio. HAL APIs are available for all peripherals.
  - Low-layer APIs (LL) offering a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. LL APIs are available only for a set of peripherals.
  - A consistent set of middleware components such as USB, H.264 video encoder, image signal processing library, Azure® RTOS, OpenBootloader, external memory manager and loader.
  - All embedded software utilities, delivered with a full set of examples.

The HAL driver layer provides a simple, generic multi-instance set of APIs (application programming interfaces) to interact with the upper layer (application, libraries, and stacks). The HAL driver APIs are split into two categories: generic APIs, which provide common and generic functions for all the STM32 series and extension APIs, which include specific and customized functions for a given line or part number. The HAL drivers include a complete set of ready-to-use APIs that simplify the user application implementation. For example, the communication peripherals contain APIs to initialize and configure the peripheral, manage data transfers in polling mode, handle interrupts or DMA, and manage communication errors. The HAL drivers are feature-oriented instead of peripheral-oriented. For example, the timer APIs are split into several categories following the peripheral functions, such as basic timer, capture, and pulse width modulation (PWM). The HAL driver layer implements runtime failure detection by checking the input values of all functions. Such dynamic checking enhances the firmware robustness. Runtime detection is also suitable for user application development and debugging.

The LL drivers offer hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities, and provide atomic operations that must be called by following the programming model described in the product line reference manual. As a result, the LL services are not based on standalone processes and do not require any additional memory resources to save their states, counter, or data pointers. All operations are performed by changing the content of the associated peripheral registers. Unlike the HAL, LL APIs are not provided for peripherals for which optimized access is not a key feature, or for those requiring heavy software configuration and/or a complex upper-level stack.

The HAL and LL are complementary and cover a wide range of application requirements:

- The HAL offers high-level and feature-oriented APIs with a high-portability level. These hide the MCU and peripheral complexity from the end user.
- The LL offers low-level APIs at register level, with better optimization but less portability. These require deep knowledge of the MCU and peripheral specifications.

The HAL- and LL-driver source code is developed in Strict ANSI-C, which makes it independent of the development tools. It is checked with the Coverity static analysis tool. It is fully documented.

It is compliant with MISRA C®:2012 standard.

This user manual is structured as follows:

- Overview of HAL drivers
- Overview of low-layer drivers
- Cohabiting of HAL and LL drivers
- Detailed description of each peripheral driver: configuration structures, functions, and how to use the given API to build your application

1 General information

The STM32CubeN6 MCU Package runs on STM32N6 32-bit microcontrollers based on the Arm® Cortex®-M processor.

Note: Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

2 Acronyms and definitions

Table 1. **Acronyms and definitions**

Acronym	Definition
ADC	Analog-to-digital converter
AES	Advanced encryption standard
ANSI	American national standards institute
API	Application programming interface
BSEC	Boot and security control
BSP	Board support package
CAN	Controller area network
CMSIS	Cortex microcontroller software interface standard
CPU	Central processing unit
CRC	CRC calculation unit
CRYP	Cryptographic processor
DLYB	Delay block
DCMI	Digital camera interface
DCMIPP	Digital camera interface pixel pipeline
DMA	Direct memory access
DMA2D	DMA dedicated to image manipulation (Chrom-ART)
DTS	Digital temperature sensor
ETH	Ethernet controller
EXTI	External interrupt/event controller
FDCAN	Flexible data-rate controller area network unit
FLASH	Flash memory
FMC	Flexible memory controller
FSBL	First stage bootloader
GFXMMU	Graphical oriented memory management unit (Chrom-GRC)
GFXTIM	Graphic timer
GPDMA	General-purpose DMA
GPIO	General-purpose I/Os
GPU2D	Graphic processing unit (Neo-Chrom)
HAL	Hardware abstraction layer
HASH	Hash processor
HCD	USB host controller driver
HPDMA	High-performance DMA
I2C	Inter-integrated circuit
I3C	Improved inter-integrated circuit
I2S	Inter-integrated sound
ICACHE	Instruction cache
IRDA	Infrared data association
IWDG	Independent watchdog

Acronym	Definition
LCD	Liquid crystal display controller
LTDC	Liquid crystal display - thin film transistor display controller
LPTIM	Low-power timer
LPUART	Low-power universal asynchronous receiver/transmitter
LRUN	Load and run
MCE	Memory cipher engine
MCO	Microcontroller clock output
MDF	Multifunction digital filter
MDIOS	Management data input/output (MDIO) slave
MMC	MultiMediaCard
MPU	Memory protection unit
MSP	MCU specific package
NAND	NAND flash memory
NOR	NOR flash memory
NVIC	Nested vectored interrupt controller
PKA	Public key accelerator
PCD	USB peripheral controller driver
PPP	STM32 peripheral or block
PSSI	Parallel synchronous slave interface
PWR	Power controller
RAMECC	RAM ECC monitoring
RCC	Reset and clock controller
RIF	Resource isolation framework
RIFSC	Resource isolation framework security controller
RISAF	Resource isolation unit for address space protection
RNG	Random number generator
RTC	Real-time clock
SAI	Serial audio interface
SAES	Secure advanced encryption standard
SBS	System configuration, boot and security
SD	Secure digital
SDMMC	SD/SDIO/MultiMediaCard card host interface
SFDP	Serial flash discovery protocol
SMARTCARD	Smartcard IC
SMBUS	System management bus
SPI	Serial peripheral interface
SPDIFRX	S/PDIF audio protocol receiver interface
SRAM	SRAM external memory
SysTick	System tick timer
TIM	Advanced-control, general-purpose or basic timer
UART	Universal asynchronous receiver/transmitter

Acronym	Definition
UCPD	USB Type-C® and Power Delivery interface
USART	Universal synchronous receiver/transmitter
USB	Universal serial bus
VENC	Video encoder
VREFBUF	Voltage reference buffer
WWDG	Window watchdog
XIP	Execute in place
XSPI	Extended SPI interface
XSPIM	XSPI I/O manager

3 Overview of HAL drivers

The HAL drivers are designed to offer a rich set of APIs and to interact easily with the application upper layers.

Each driver consists of a set of functions covering the most common peripheral features. The development of each driver is driven by a common API which standardizes the driver structure, the functions, and the parameter names.

The HAL drivers include a set of driver modules, each module being linked to a standalone peripheral. However, in some cases, the module is linked to a peripheral functional mode. As an example, several modules exist for the USART peripheral: UART driver module, USART driver module, SMARTCARD driver module and IRDA driver module.

The HAL main features are the following:

- Cross-family portable set of APIs covering the common peripheral features as well as extension APIs in case of specific peripheral features.
- Three API programming models: polling, interrupt, and DMA.
- APIs are RTOS-compliant:
  - Fully reentrant APIs
  - Systematic usage of timeouts in polling mode
- Support of peripheral multi-instance allowing concurrent API calls for multiple instances of a given peripheral (such as USART1 or USART2)
- All HAL APIs implement a user-callback functions mechanism:
  - Peripheral Init/DeInit HAL APIs can call user-callback functions to perform peripheral system level Initialization/De-Initialization (clock, GPIOs, interrupt, DMA)
  - Peripherals interrupt events
  - Error events
- Object locking mechanism: safe hardware access to prevent multiple spurious accesses to shared resources.
- Timeout used for all blocking processes: the timeout can be a simple counter or a timebase.

3.1 HAL and user-application files

3.1.1 HAL driver files

HAL drivers are composed of the following set of files:

Table 2. HAL driver files

File	Description
stm32n6xx_hal_ppp.c	Main peripheral/module driver file It includes the APIs that are common to all STM32 devices. *Example: stm32n6xx_hal_adc.c, stm32n6xx_hal_irda.c.*
stm32n6xx_hal_ppp.h	Header file of the main driver C file It includes common data, handle and enumeration structures, define statements and macros, as well as the exported generic APIs. *Example:stm32n6xx_hal_adc.h,stm32n6xx_hal_irda.h.*
stm32n6xx_hal_ppp_ex.c	Extension file of a peripheral/module driver. It includes the specific APIs for a given part number or family, as well as the newly defined APIs that overwrite the default generic APIs if the internal process is implemented in a different way. *Example:stm32n6xx_hal_adc_ex.c,stm32n6xx_hal_flash_ex.c.*
stm32n6xx_hal_ppp_ex.h	Header file of the extension C file It includes the specific data and enumeration structures, define statements, and macros, as well as the exported device part number specific APIs *Example: stm32n6xx_hal_adc_ex.h,stm32n6xx_hal_flash_ex.h.*
stm32n6xx_hal.c	This file is used for HAL initialization and contains VREFBUF, SBS, DBGMCU, remap and time delay based on SysTick APIs.
stm32n6xx_hal.h	stm32n6xx_hal.c header file
stm32n6xx_hal_msp_template.c	Template file to be copied to the user application folder It contains the MSP initialization and deinitialization (main routine and callbacks) of the peripheral used in the user application.
stm32n6xx_hal_conf_template.h	Template file allowing the drivers to be customized for a given application
stm32n6xx_hal_def.h	Common HAL resources such as common define statements, enumerations, structures, and macros

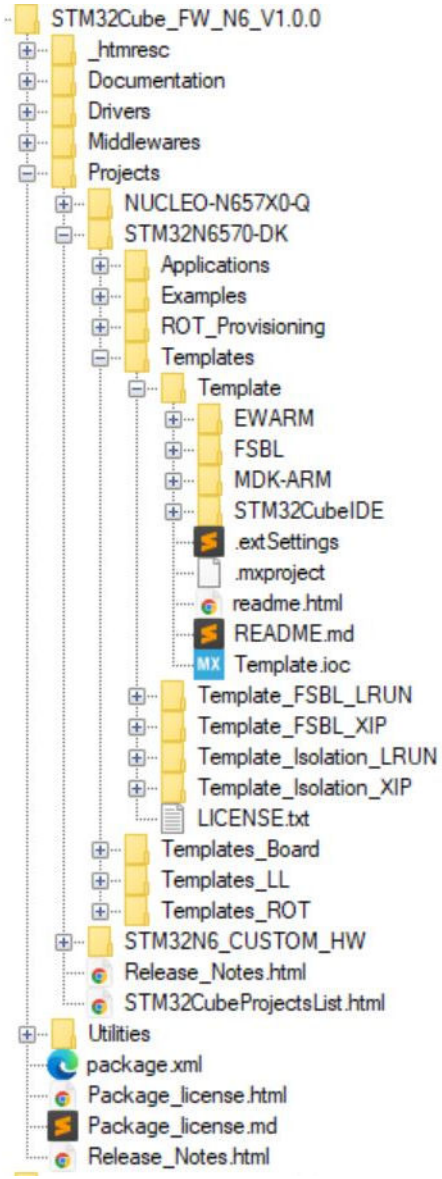
3.1.2 User-application files

The minimum files required to build an application using the HAL are listed in the table below:

Table 3. User-application files

File	Description
system_stm32n6xx.c	This file contains SystemInit() that is called at startup just after reset and before branching to the main program. It does not configure the system clock at startup (contrary to the standard library). This is to be done using the HAL APIs in the user files. It allows the relocation of the vector table in internal SRAM.
startup_stm32n657xx/n655xx/ n647xx/n645xx.s	Toolchain specific file that contains reset handler and exception vectors. For some toolchains, it allows the adaptation of the stack/heap size to fit the application requirements.
stm32n657xx_axisram.icf	This file is the linker file for the EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the application requirements in internal SRAM 1.
stm32n657xx_axisram2_fsbl.icf	This file is the linker file for the EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the application requirements in internal SRAM 2, at the location where the FSBL binary is copied by the boot ROM.

File	Description
stm32n6xx_hal_msp.c	This file contains the MSP initialization and deinitialization (main routine and callbacks) of the peripheral used in the user application.
stm32n6xx_hal_conf.h	This file allows the HAL drivers to be customized for a specific application. It is not mandatory to modify this configuration. The application can use the default configuration without any modification.
stm32n6xx_it.c/.h	This file contains the exceptions handler and peripherals interrupt service routine, and calls HAL_IncTick() at regular time intervals to increment a local variable (declared in *stm32n6xx*_hal.c) used as HAL timebase. By default, this function is called each 1 ms in SysTick ISR. The PPP_IRQHandler() routine must call HAL_PPP_IRQHandler() if an interrupt-based process is used within the application.
main.c/.h	This file contains the main program routine, mainly: • Call to HAL_Init() • assert_failed() implementation • system clock configuration • peripheral HAL initialization and user application code.



The STM32Cube package comes with ready-to-use project templates, one for each supported board. Each project contains the files listed above and a preconfigured project for the supported toolchains.

Each project template provides an empty main loop function and can be used as a starting point to get familiar with project settings for STM32Cube. Its features are the following:

- It contains the sources of HAL, CMSIS, and BSP drivers which are the minimal components to develop a code on a given board.
- It contains the include paths for all the firmware components.
- It defines the STM32 device supported, and configures the CMSIS and HAL drivers accordingly.
- It provides ready to use user files preconfigured as defined below:
  - HAL is initialized
  - SysTick ISR implemented for HAL_GetTick()
  - System clock configured with the selected device frequency.

Note: If an existing project is copied to another location, then include paths must be updated.

Figure 1. **Example of project template**

3.2 HAL data structures

Each HAL driver can contain the following data structures:

- Peripheral handle structures
- Initialization and configuration structures
- Specific process structures.

3.2.1 Peripheral handle structures

The APIs have a modular generic multi-instance architecture that enables working with several peripheral instances simultaneously.

PPP_HandleTypeDef *handle is the main structure that is implemented in the HAL drivers. It handles the peripheral/module configuration and registers and embeds all the structures and variables needed to follow the peripheral device flow.

The peripheral handle is used for the following purposes:

- Multi-instance support: each peripheral/module instance has its own handle. As a result instance resources are independent.
- Peripheral process intercommunication: the handle is used to manage shared data resources between the process routines.
  Example: global pointers, DMA handles, state machine.
- Storage: this handle is also used to manage global variables within a given HAL driver.

An example of peripheral structure is shown below:

```
typedef struct
{
USART_TypeDef *Instance; /* USART registers base address */
USART_InitTypeDef Init; /* Usart communication parameters */
uint8_t *pTxBuffPtr;/* Pointer to Usart Tx transfer Buffer */
uint16_t TxXferSize; /* Usart Tx Transfer size */
__IO uint16_t TxXferCount;/* Usart Tx Transfer Counter */
uint8_t *pRxBuffPtr;/* Pointer to Usart Rx transfer Buffer */
uint16_t RxXferSize; /* Usart Rx Transfer size */
__IO uint16_t RxXferCount; /* Usart Rx Transfer Counter */
DMA_HandleTypeDef *hdmatx; /* Usart Tx DMA Handle parameters */
DMA_HandleTypeDef *hdmarx; /* Usart Rx DMA Handle parameters */
HAL_LockTypeDef Lock; /* Locking object */
__IO HAL_USART_StateTypeDef State; /* Usart communication state */
__IO HAL_USART_ErrorTypeDef ErrorCode;/* USART Error code */
}USART_HandleTypeDef;
```

Note:

1. *The multi-instance feature implies that all the APIs used in the application are reentrant and avoid using global variables because subroutines can fail to be reentrant if they rely on a global variable to remain unchanged but that variable is modified when the subroutine is recursively invoked. For this reason, the following rules are respected:*
   - *Reentrant code does not hold any static (or global) nonconstant data: reentrant functions can work with global data. For example, a reentrant interrupt service routine can grab a piece of hardware status to work with (for example serial port read buffer) which is not only global, but volatile. Still, typical use of static variables and global data is not advised, in the sense that only atomic read-modify-write instructions should be used in these variables. It should not be possible for an interrupt or signal to occur during the execution of such an instruction.*
   - *Reentrant code does not modify its own code.*
2. *When a peripheral can manage several processes simultaneously using the DMA (full duplex case), the DMA interface handle for each process is added in the PPP_HandleTypeDef.*
3. *For the shared and system peripherals, no handle or instance object is used. The peripherals concerned by this exception are the following:*
   - *GPIO*
   - *SYSTICK*
   - *NVIC*
   - *PWR*
   - *RCC*

3.2.2 Initialization and configuration structure

These structures are defined in the generic driver header file when it is common to all part numbers. When they can change from one part number to another, the structures are defined in the extension header file for each part number.

```
typedef struct
{
uint32_t BaudRate;      /*!< This member configures the Usart communication
                             baud rate. The baud rate is computed using the
                             following formula: Baud Rate Register[15:4]=((2 *
                             fclk_pres)/((huart->Init.BaudRate)))[15:4] BaudRate
                             Register[3]=0 Baud Rate Register[2:0]=(((2*
                             fclk_pres)/((huart->Init.BaudRate)))[3:0]) >> 1
                             where fclk_pres is the USART input clock frequency
                             (fclk) divided by a prescaler. The oversampling by 8
                             is systematically applied to achieve high baudrates.*/
uint32_t WordLength;    /*!< Specifies the number of data bits transmitted or
                             received in a frame.This parameter can be a value of
                             USAR TEx_Word_Length. */
uint32_t StopBits;      /*!< Specifies the number of stop bits transmitted. This
                             parameter can be a value of USART_Stop_Bits. */
uint32_t Parity;        /*!< Specifies the parity mode. This parameter can be a value
                             of USART_Parity @note When parity is enabled, the
                             computed parity is inserted at the MSB position of the
                             transmitted data (9th bit when the word length is set to
                             9 data bits; 8th bit when the word length is set to 8
                             data bits). */
uint32_t Mode;          /*!< Specifies whether the Receive or Transmit mode is
                             enabled or disabled. This parameter can be a value of
                             USART_Mode. */
uint32_t CLKPolarity;   /*!< Specifies the steady state of the serial clock. This
                             parameter can be a value of USART_Clock_Polarity. */ uint32_t CL
KPhase;      /*!< Specifies the clock transition on which the bit capture
                             is made. This parameter can be a value of
                             USART_Clock_Phase. */
uint32_t CLKLastBit;    /*!< Specifies whether the clock pulse corresponding to the
                             last transmitted data bit (MSB) has to be output on the
                             SCLK pin in synchronous mode. This parameter can be a
                             value of USART_Last_Bit. */
uint32_t ClockPrescaler; /*!< Specifies the prescaler value used to divide the USART
                             clock source. This parameter can be a value of
                             USART_ClockPrescaler. */
} USART_InitTypeDef;
```

Note: The config structure is used to initialize the submodules or subinstances. See below example:

```
HAL_ADC_ConfigChannel (ADC_HandleTypeDef* hadc, const ADC_ChannelConfTypeDef *pConfig)
```

3.2.3 Specific process structures

The specific process structures are used for specific process (common APIs). They are defined in the generic driver header file.

Example:

```
HAL_PPP_Process (PPP_HandleTypeDef* hadc,PPP_ProcessConfig* sConfig)
```

3.3 API classification

The HAL APIs are classified into the following categories:

- **Generic APIs:** common generic APIs applying to all STM32 devices. These APIs are consequently present in the generic HAL driver files of all STM32 microcontrollers.

```
HAL_StatusTypeDef HAL_ADC_Init(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_DeInit(ADC_HandleTypeDef *hadc);
HAL_StatusTypeDef HAL_ADC_Start(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Start_IT(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop_IT(ADC_HandleTypeDef* hadc);
void HAL_ADC_IRQHandler(ADC_HandleTypeDef* hadc);
```

- **Extension APIs:**
  This set of API is divided into two subcategories :
  - **Family specific APIs:** APIs applying to a given family. They are located in the extension HAL driver file (see example below related to the ADC).

```
HAL_StatusTypeDef HAL_ADCEx_Calibration_Start(ADC_HandleTypeDef* hadc,uint32_t Sin
gleDiff);
uint32_t HAL_ADCEx_Calibration_GetValue(ADC_HandleTypeDef* hadc, uint32_t SingleDi
ff);
```

  - **Feature/Device specific APIs**: these APIs are implemented in the extension file and delimited by specific define statements relative to CMSIS bits or features and depending on device part number.

Note: The data structure related to the specific APIs is delimited by the device part number define statement. It is located in the corresponding extension header C file.

The following table summarizes the location of the different categories of HAL APIs in the driver files.

Table 4. API classification

	Generic file	Extension file
Common APIs	X	X
Family specific APIs	-	X
Device specific APIs	-	X

Note: Family specific APIs are only related to a given family. This means that if a specific API is implemented in another family, and the arguments of this latter family are different, additional structures and arguments might need to be added.

The IRQ handlers are used for common and family specific processes.

3.4 Devices supported by HAL drivers

Table 5. List of devices supported by HAL/LL drivers

Peripheral/Module	STM32N657/655xx	STM32N647xx/645xx

3.5 HAL driver rules

3.5.1 HAL API naming rules

The following naming rules are used in HAL drivers:

Table 6. HAL API naming rules

	Generic	Family specific APIs	Device specific APIs
File names	*stm32n6xx_hal_ppp (c/h)*	*stm32n6xx_hal_ppp_ex (c/h)*	*stm32n6xx_ hal_ppp_ex (c/h)*
Module name	*HAL_PPP_ MODULE*		
Function name	*HAL_PPP_Function* *HAL_PPP_FeatureFunction_MODE*	*HAL_PPPEx_Function* *HAL_PPPEx_FeatureFunction_MODE*	*HAL_PPPEx_Function* *HAL_PPPEx_FeatureFunction_MODE*
Handle name	*PPP_HandleTypedef*	*NA*	*NA*
Init structure name	*PPP_InitTypeDef*	*NA*	*PPP_InitTypeDef*
Enum name	*HAL_PPP_StructnameTypeDef*	*NA*	*NA*

- The **PPP** prefix refers to the peripheral functional mode and not to the peripheral itself. For example, if the USART, PPP can be USART, IRDA, UART, or SMARTCARD depending on the peripheral mode.
- The constants used in one file are defined within this file. A constant used in several files is defined in a header file. All constants are written in uppercase, except for peripheral driver function parameters.
- typedef variable names should be suffixed with _TypeDef.
- Registers are considered as constants. In most cases, their name is in uppercase and uses the same acronyms as in the STM32N6 reference manuals.
- Peripheral registers are declared in the PPP_TypeDef structure (for example ADC_TypeDef) in the stm32n6xxx.h header file:
stm32n6xxx.h corresponds to stm32n657xx.h, stm32n655xx.h, stm32n647xx.h and stm32n645xx.h
- Peripheral function names are prefixed by HAL_, then the corresponding peripheral acronym in uppercase followed by an underscore. The first letter of each word is in uppercase (for example HAL_UART_Transmit()). Only one underscore is allowed in a function name to separate the peripheral acronym from the rest of the function name.
- The structure containing the PPP peripheral initialization parameters are named PPP_InitTypeDef (for example ADC_InitTypeDef).
- The structure containing the specific configuration parameters for the PPP peripheral are named PPP_xxxxConfTypeDef (for example ADC_ChannelConfTypeDef).
- Peripheral handle structures are named PPP_HandleTypedef (e.g DMA_HandleTypeDef)
- The functions used to initialize the PPP peripheral according to parameters specified in PPP_InitTypeDef are named HAL_PPP_Init (for example HAL_TIM_Init()).
- The functions used to reset the PPP peripheral registers to their default values are named HAL_PPP_DeInit (for example HAL_TIM_DeInit()).
- The **MODE** suffix refers to the process mode, which can be polling, interrupt or DMA. As an example, when the DMA is used in addition to the native resources, the function should be called:
HAL_PPP_Function_DMA().
- The **Feature** prefix should refer to the new feature.
Example: *HAL_ADCEx_InjectedStart()*() refers to the injection mode.

3.5.2 HAL general naming rules

- For the shared and system peripherals, no handle or instance object is used. This rule applies to the following peripherals:
  - GPIO
  - SYSTICK
  - NVIC
  - RCC

Example: The *HAL_GPIO_Init()* requires only the GPIO address and its configuration parameters.

```
HAL_StatusTypeDef HAL_GPIO_Init (GPIO_TypeDef* GPIOx, GPIO_InitTypeDef *Init)
{
/*GPIO Initialization body */
}
```

- The macros that handle interrupts and specific clock configurations are defined in each peripheral/module driver. These macros are exported in the peripheral driver header files so that they can be used by the extension file. The list of these macros is defined below:

Note: This list is not exhaustive and other macros related to peripheral features can be added, so that they can be used in the user application.

Table 7. Macros handling interrupts and specific clock configurations

Macros	Description
__HAL_PPP_ENABLE_IT(__HANDLE__, __INTERRUPT__)	Enables a specific peripheral interrupt
__HAL_PPP_DISABLE_IT(__HANDLE__, __INTERRUPT__)	Disables a specific peripheral interrupt
__HAL_PPP_GET_IT (__HANDLE__, __ INTERRUPT __)	Gets a specific peripheral interrupt status
__HAL_PPP_CLEAR_IT (__HANDLE__, __ INTERRUPT __)	Clears a specific peripheral interrupt status
__HAL_PPP_GET_FLAG (__HANDLE__, __FLAG__)	Gets a specific peripheral flag status
__HAL_PPP_CLEAR_FLAG (__HANDLE__, __FLAG__)	Clears a specific peripheral flag status
__HAL_PPP_ENABLE(__HANDLE__)	Enables a peripheral
__HAL_PPP_DISABLE(__HANDLE__)	Disables a peripheral
__HAL_PPP_XXXX (__HANDLE__, __PARAM__)	Specific PPP HAL driver macro
__HAL_PPP_GET_ IT_SOURCE (__HANDLE__, __ INTERRUPT __)	Checks the source of the specified interrupt

- NVIC and SYSTICK are two Arm® Cortex® core features. The APIs related to these features are located in the stm32n6xx_hal_cortex.c file.
- The PPP handles are valid before using the HAL_PPP_Init() API. The init function performs a check before modifying the handle fields.

```
 HAL_PPP_Init(PPP_HandleTypeDef)
if(hppp == NULL)
 {
 return HAL_ERROR;
 }
```

- The macros defined below are used:
  - Conditional macro:

```
#define ABS(x) (((x) > 0) ? (x) : -(x))
```

  - Pseudocode macro (multiple instructions macro):

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
(__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
(__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

3.5.3 HAL interrupt handler and callback functions

Besides the APIs, HAL peripheral drivers include:

- HAL_PPP_IRQHandler() peripheral interrupt handler that should be called from stm32n6xx_it.c
- User callback functions.

The user callback functions are defined as empty functions with “weak” attribute. They have to be defined in the user code.

There are three types of user callbacks functions:

- Peripheral system level initialization/ de-Initialization callbacks: HAL_PPP_MspInit() and HAL_PPP_MspDeInit
- Process complete callbacks: HAL_PPP_ProcessCpltCallback
- Error callback: HAL_PPP_ErrorCallback.

Table 8. Callback functions

Callback functions	Example
HAL_PPP_MspInit() / _DeInit()	Example: HAL_USART_MspInit() Called from HAL_PPP_Init() API function to perform peripheral system level initialization (GPIOs, clock, DMA, interrupt)
HAL_PPP_ProcessCpltCallback	Example: HAL_USART_TxCpltCallback Called by the peripheral or DMA interrupt handler when the process completes
HAL_PPP_ErrorCallback	Example: HAL_USART_ErrorCallback Called by the peripheral or DMA interrupt handler when an error occurs

3.6 HAL generic APIs

The generic APIs provide common generic functions applying to all STM32 devices. They are composed of four APIs groups:

- **Initialization and deinitialization functions:**HAL_PPP_Init(), HAL_PPP_DeInit()
- **I/O operation functions**: HAL_PPP_Read(), HAL_PPP_Write(),HAL_PPP_Transmit(), HAL_PPP_Receive()
- **Control functions**: HAL_PPP_Set (), HAL_PPP_Get ().
- **State and error functions**: HAL_PPP_GetState (), HAL_PPP_GetError ().

For some peripheral/module drivers, these groups are modified depending on the peripheral/module implementation.

Example: in the timer driver, the API grouping is based on timer features (such as PWM, OC, and IC).

The initialization and deinitialization functions initialize a given peripheral and configure the low-level resources, mainly clocks, GPIO, alternate functions (AF) and possibly DMA and interrupts. The *HAL_DeInit()* function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.

The I/O operation functions perform a row access to the peripheral payload data in write and read modes.

The control functions are used to dynamically change the peripheral configuration and set another operating mode.

The peripheral state and errors functions retrieve in runtime the peripheral and data flow states, and identifying the type of errors that occurred. The example below is based on the ADC peripheral. The list of generic APIs is not exhaustive. It is only given as an example.

Table 9. HAL generic APIs

Function group	Common API name	Description
Initialization group	*HAL_ADC_Init()*	This function initializes the peripheral and configures the low-level resources (such as clocks, GPIO, AF)
	HAL_ADC_DeInit()	This function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.
I/O operation group	*HAL_ADC_Start ()*	This function starts ADC conversions when the polling method is used
	HAL_ADC_Stop ()	This function stops ADC conversions when the polling method is used
	HAL_ADC_PollForConversion()	This function waits for the end of conversions when the polling method is used. In this case, a timeout value is specified by the user according to the application.
	HAL_ADC_Start_IT()	This function starts ADC conversions when the interrupt method is used
	HAL_ADC_Stop_IT()	This function stops ADC conversions when the interrupt method is used
	HAL_ADC_IRQHandler()	This function handles ADC interrupt requests
	HAL_ADC_ConvCpltCallback()	Callback function called in the IT subroutine to indicate the end of the current process or when a DMA transfer has been completed
	HAL_ADC_ErrorCallback()	Callback function called in the IT subroutine if a peripheral error or a DMA transfer error occurred
Control group	*HAL_ADC_ConfigChannel()*	This function configures the selected ADC regular channel, the corresponding rank in the sequencer and the sample time
	HAL_ADC_AnalogWDGConfig	This function configures the analog watchdog for the selected ADC
State and errors group	*HAL_ADC_GetState()*	This function gets in runtime the peripheral and the data flow states.
	HAL_ADC_GetError()	This fuction gets in runtime the error that occurred during an IT routine

3.7 HAL extension APIs

3.7.1 HAL extension model overview

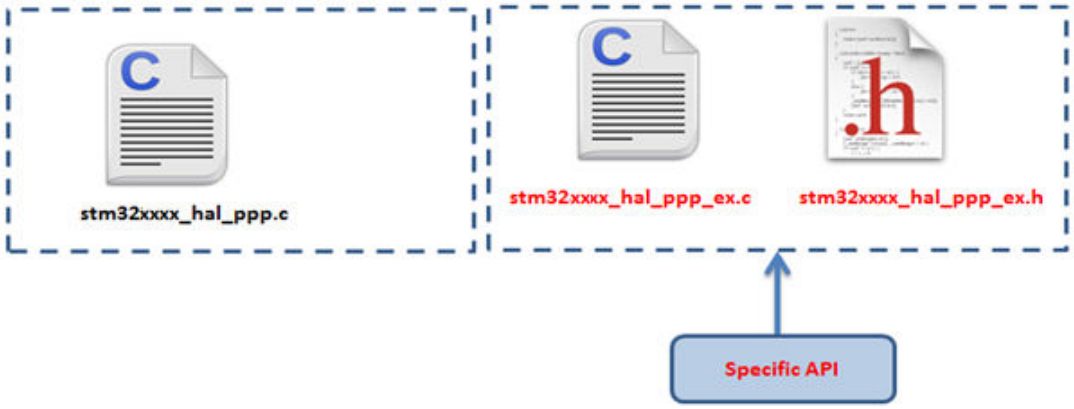
The extension APIs provide specific functions or overwrite modified APIs for a specific family (series) or specific part number within the same family.

The extension model consists of an additional file, stm32n6xx_hal_ppp_ex.c, that includes all the specific functions and define statements (stm32n6xx_hal_ppp_ex.h) for a given part number.

Below is an example based on the ADC peripheral:

Table 10. HAL extension APIs

Function group	Common API name
HAL_ADCEx_CalibrationStart()	This function is used to start the automatic ADC calibration
HAL_ADCEx_InjectedStart	This function is used to start the conversion of injected groups.



3.7.2 HAL extension model cases

The specific peripheral features can be handled by the HAL drivers in five different ways. They are described below.

Adding a part number-specific function

When a new feature specific to a given device is required, the new APIs are added in the stm32n6xx_hal_ppp_ex.c extension file. They are named HAL_PPPEx_Function().

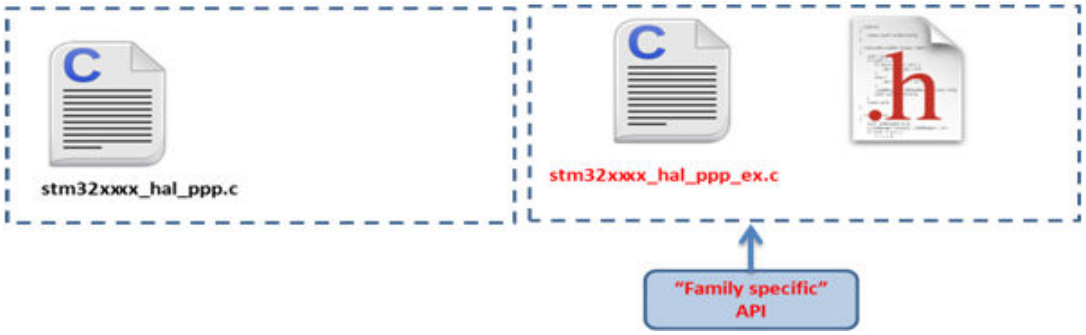


Figure 2. Adding device-specific functions

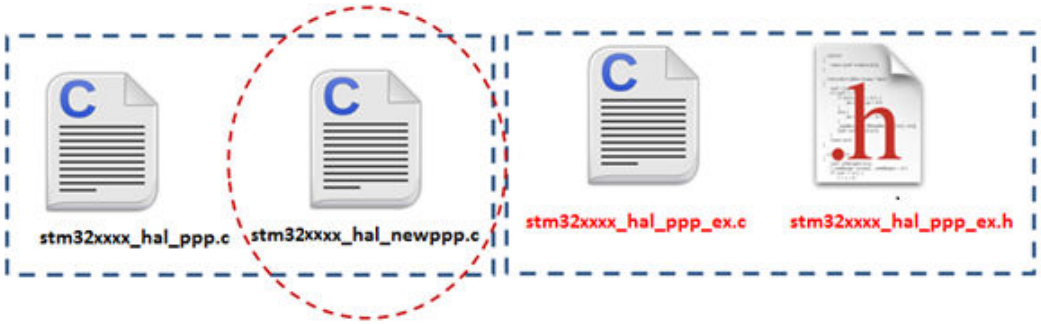
Adding a family-specific function

In this case, the API is added in the extension driver C file and named HAL_PPPEx_Function ().

Figure 3. Adding family-specific functions

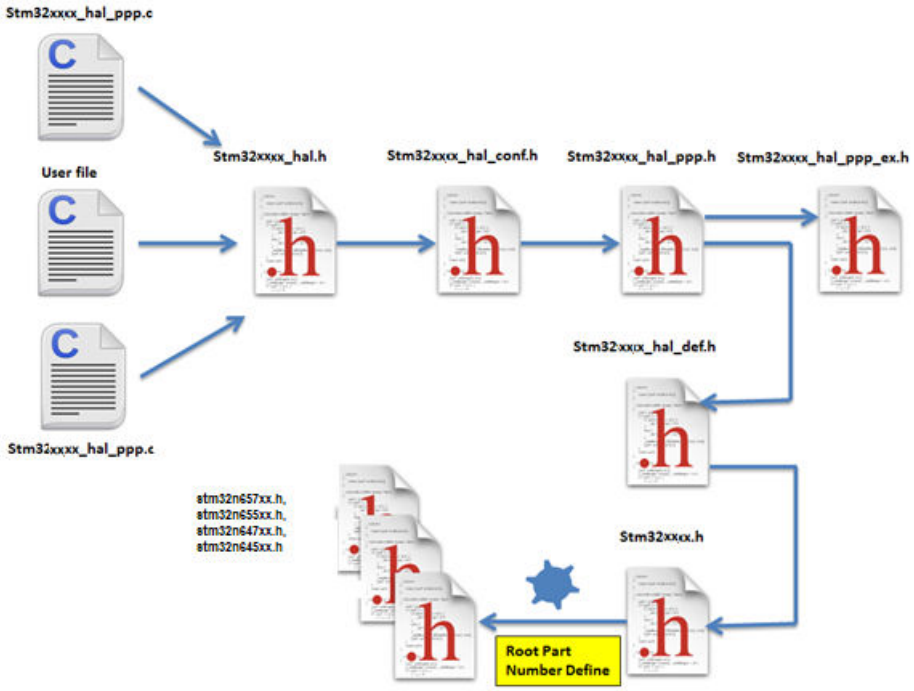


Adding a new peripheral (specific to a device belonging to a given family)

When a peripheral which is available only in a specific device is required, the APIs corresponding to this new peripheral/module (newPPP) are added in a new stm32n6xx_hal_newppp.c. However, the inclusion of this file is selected in the stm32n6xx_hal_conf.h using the macro:

```
#define HAL_NEWPPP_MODULE_ENABLED
```

Figure 4. **Adding new peripherals**



Example: stm32n6xx_hal_adc.c/h

3.8 File inclusion model

The header of the common HAL driver file (stm32n6xx_hal.h) includes the common configurations for the whole HAL library. It is the only header file that is included in the user sources and the HAL C sources files to be able to use the HAL resources.

Figure 5. **File inclusion model**

A PPP driver is a standalone module which is used in a project. The user must enable the corresponding USE_HAL_PPP_MODULE define statement in the configuration file.

```
/**********************************************************************
* @file stm32n6xx_hal_conf.h
* @author MCD Application Team
* @version VX.Y.Z * @date dd-mm-yyyy
* @brief This file contains the modules to be used
**********************************************************************
(…)
#define USE_HAL_USART_MODULE
#define USE_HAL_IRDA_MODULE
#define USE_HAL_DMA_MODULE
```

```
#define USE_HAL_RCC_MODULE
(…)
```

3.9 HAL common resources

The common HAL resources, such as common define enumerations, structures, and macros, are defined in *stm32n6xx_hal_def.h.*The main common define enumeration is *HAL_StatusTypeDef*.

- **HAL status**
  The HAL status is used by almost all HAL APIs, except for boolean functions and the IRQ handler. It returns the status of the current API operations. It has four possible values as described below:

```
Typedef enum
{
HAL_OK = 0x00,
HAL_ERROR = 0x01,
HAL_BUSY = 0x02,
HAL_TIMEOUT = 0x03
} HAL_StatusTypeDef;
```

- **HAL locked**
  The HAL lock is used by all HAL APIs to prevent accessing by accident shared resources.

```
typedef enum
{
HAL_UNLOCKED = 0x00, /*!<Resources unlocked */
HAL_LOCKED = 0x01 /*!< Resources locked */
} HAL_LockTypeDef;
```

  In addition to common resources, the stm32n6xx_hal_def.h file calls the stm32n6xx.h file in the CMSIS library to get the data structures and the address mapping for all peripherals:

  – Declarations of peripheral registers and bits definition.
  – Macros to access peripheral registers hardware (such as write register or read register).

- **Common macros**
  – Macro defining HAL_MAX_DELAY

```
#define HAL_MAX_DELAY 0xFFFFFFFF
```

  – Macro linking a PPP peripheral to a DMA structure pointer:

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
  (__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
  (__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

3.10 HAL configuration

The configuration file, stm32n6xx_hal_conf.h, performs the customization of the drivers for the user application. Modifying this configuration is not mandatory: the application can use the default configuration without any modification.

To configure these parameters, the user should enable, disable, or modify some options by uncommenting, commenting, or modifying the values of the related define statements as described in the table below:

Table 11. Define statements used for HAL configuration

Configuration item	Description	Default Value
HSE_VALUE	Value of the external oscillator (HSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	48 000 000 Hz
HSE_STARTUP_TIMEOUT	Timeout for HSE startup, expressed in ms	100 ms
HSI_VALUE	Value of the internal oscillator (HSI) expressed in Hz.	64 000 000 Hz
LSI_VALUE	Default value of the low-speed internal oscillator (LSI) expressed in Hz.	32000 Hz
LSE_VALUE	Value of the external oscillator (LSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	32768 Hz

Note: The stm32n6xx_hal_conf_template.h file is located in the HAL drivers Inc folder. It should be copied to the user folder, renamed and modified as described above.

By default, the values defined in the stm32n6xx_hal_conf_template.h file are the same as the ones used for the examples and demonstrations. All HAL include files are enabled so that they can be used in the user code without modifications.

3.11 HAL system peripheral handling

This section gives an overview of how the system peripherals are handled by the HAL drivers. The full API list is provided within each peripheral driver description section.

3.11.1 Clocks

Two main functions can be used to configure the system clock:

- HAL_RCC_OscConfig (RCC_OscInitTypeDef *RCC_OscInitStruct). This function configures/enables multiple clock sources (HSE, HSI, LSE, LSI, PLL).
- HAL_RCC_ClockConfig (RCC_ClkInitTypeDef *RCC_ClkInitStruct, uint32_t FLatency). This function
  - Selects the system clock source
  - Configures AHB, APB1, APB2, APB4, and APB5 clock dividers
  - Updates the SysTick configuration when the HCLK clock changes.

Some peripheral clocks are not derived from the system clock (such as RTC, USB). In this case, the clock configuration is performed by an extended API defined in stm32n6xx_hal_rcc_ex.c: *HAL_RCCEx_PeriphCLKConfig(RCC_PeriphCLKInitTypeDef *PeriphClkInit)*.

Additional RCC HAL driver functions are available:

- HAL_RCC_DeInit() clock deinitialization function that returns clock configuration to the reset state
- Get clock functions that retrieve the various clock configurations (such as system clock)
- MCO configuration functions

A set of macros are defined in stm32n6xx_hal_rcc.h and stm32n6xx_hal_rcc_ex.h. They enable the execution of elementary operations on RCC block registers, such as peripheral clock gating/reset control:

- __HAL_PPP_CLK_ENABLE/__HAL_PPP_CLK_DISABLE to enable/disable the peripheral clock.
- __HAL_PPP_FORCE_RESET/__HAL_PPP_RELEASE_RESET to force/release peripheral reset
- __HAL_PPP_CLK_SLEEP_ENABLE/__HAL_PPP_CLK_SLEEP_DISABLE to enable/disable the peripheral clock during Sleep mode.
- __HAL_PPP_IS_CLK_ENABLED/__HAL_PPP_IS_CLK_DISABLED to query about the enabled/disabled status of the peripheral clock.
- __HAL_PPP_IS_CLK_SLEEP_ENABLED/__HAL_PPP_IS_CLK_SLEEP_DISABLED to query about the enabled/disabled status of the peripheral clock during Sleep mode.

3.11.2 GPIOs

GPIO HAL APIs are the following:

- HAL_GPIO_Init() / HAL_GPIO_DeInit()
- HAL_GPIO_ReadPin() / HAL_GPIO_WritePin()
- HAL_GPIO_TogglePin ().
- HAL_GPIO_LockPin()
- HAL_GPIO_ConfigPinAttributes()/HAL_GPIO_GetConfigPinAttributes()

In addition to standard GPIO modes (input, output, analog), the pin mode can be configured as EXTI with interrupt or event generation.

When selecting EXTI mode with interrupt generation, the user must call HAL_GPIO_EXTI_IRQHandler() from stm32n6xx_it.c and implement HAL_GPIO_EXTI_Callback().

The table below describes the GPIO_InitTypeDef structure field.

Table 12. Description of GPIO_InitTypeDef structure

Structure field	Description
Pin	Specifies the GPIO pins to be configured. Possible values: GPIO_PIN_x or GPIO_PIN_All, where x[0..15]
Mode	Specifies the operating mode for the selected pins: GPIO mode or EXTI mode. Possible values are: • GPIO mode – GPIO_MODE_INPUT: Input floating – GPIO_MODE_OUTPUT_PP: Output push-pull – GPIO_MODE_OUTPUT_OD: Output open drain – GPIO_MODE_AF_PP: Alternate function push-pull – GPIO_MODE_AF_OD: Alternate function open drain – GPIO_MODE_ANALOG: Analog mode • External interrupt mode – GPIO_MODE_IT_RISING: Rising edge trigger detection – GPIO_MODE_IT_FALLING: Falling edge trigger detection – GPIO_MODE_IT_RISING_FALLING: Rising/Falling edge trigger detection • External event mode – GPIO_MODE_EVT_RISING: Rising edge trigger detection – GPIO_MODE_EVT_FALLING: Falling edge trigger detection – GPIO_MODE_EVT_RISING_FALLING: Rising/Falling edge trigger detection
Pull	Specifies the pull-up or pull-down activation for the selected pins. Possible values are: GPIO_NOPULL GPIO_PULLUP GPIO_PULLDOWN
Speed	Specifies the speed for the selected pins Possible values are: GPIO_SPEED_FREQ_LOW GPIO_SPEED_FREQ_MEDIUM GPIO_SPEED_FREQ_HIGH GPIO_SPEED_FREQ_VERY_HIGH

Please find below typical GPIO configuration examples:

- Configuring GPIOs as output push-pull to drive external LEDs:

```
GPIO_InitStruct.Pin = GPIO_PIN_12 | GPIO_PIN_13 | GPIO_PIN_14 | GPIO_PIN_15;
GPIO_InitStruct.Mode = GPIO_MODE_OUTPUT_PP;
GPIO_InitStruct.Pull = GPIO_PULLUP;
GPIO_InitStruct.Speed = GPIO_SPEED_FREQ_MEDIUM;
HAL_GPIO_Init(GPIOD, &GPIO_InitStruct);
```

- Configuring PA0 as an external interrupt with falling edge sensitivity:

```
GPIO_InitStructure.Mode = GPIO_MODE_IT_FALLING;
GPIO_InitStructure.Pull = GPIO_NOPULL;
GPIO_InitStructure.Pin = GPIO_PIN_0;
HAL_GPIO_Init(GPIOA, &GPIO_InitStructure);
```

3.11.3 Cortex® NVIC and SysTick timer

The Cortex® HAL driver, stm32n6xx_hal_cortex.c, provides APIs to handle NVIC and SysTick. The supported APIs include:

- HAL_NVIC_SetPriority()/ HAL_NVIC_SetPriorityGrouping()
- HAL_NVIC_GetPriority() / HAL_NVIC_GetPriorityGrouping()

- HAL_NVIC_EnableIRQ()/HAL_NVIC_DisableIRQ()
- HAL_NVIC_SystemReset()
- HAL_SYSTICK_IRQHandler()
- HAL_NVIC_GetPendingIRQ() / HAL_NVIC_SetPendingIRQ () / HAL_NVIC_ClearPendingIRQ()
- HAL_NVIC_GetActive(IRQn)
- HAL_SYSTICK_Config()
- HAL_SYSTICK_CLKSourceConfig()
- HAL_SYSTICK_Callback()
- HAL_MPU_Enable()
- HAL_MPU_Disable()
- HAL_MPU_ConfigRegion()
- HAL_MPU_EnableRegion()
- HAL_MPU_DisableRegion()
- HAL_CORTEX_ClearEvent()

3.11.4 PWR

The PWR HAL driver handles power management. The features shared between all STM32 series are listed below:

- PVD configuration, enabling/disabling
  - HAL_PWR_ConfigPVD()
  - HAL_PWR_EnablePVD() / HAL_PWR_DisablePVD()
- Wake-up pin configuration
  - HAL_PWR_EnableWakeUpPin() / HAL_PWR_DisableWakeUpPin()
- Low-power mode entry
  - HAL_PWR_EnterSLEEPMode()
  - HAL_PWR_EnterSTOPMode()
  - HAL_PWR_EnterSTANDBYMode()
- STM32N6 low-power configuration features:
  - HAL_PWR_EnableSleepOnExit() / HAL_PWR_DisableSleepOnExit: (low-power management Sleep-on-entry)
  - HAL_PWR_EnableSEVOnPend() / HAL_PWR_DisableSEVOnPend (signal event on pending interrupt)

3.11.5 EXTI

The EXTI is not considered as a standalone peripheral but rather as a service used by other peripheral, that are handled through EXTI HAL APIs. In addition, each peripheral HAL driver implements the associated EXTI configuration and function as macros in its header file.

The first 16 EXTI lines connected to the GPIOs are managed within the GPIO driver. The GPIO_InitTypeDef structure configures a given I/O as an external interrupt or external event.

The EXTI lines connected internally to the PVD, RTC, USB, and Ethernet, are configured within the HAL drivers of these peripheral through the macros given in the table below.

The EXTI internal connections depend on the targeted STM32 microcontroller (refer to the product datasheet for more details):

Table 13. Description of EXTI configuration macros

Macros	Description
__HAL_PPP_{SUBLOCK}__EXTI_ENABLE_IT()	Enables a given EXTI line interrupt Example: __HAL_PWR_PVD_EXTI_ENABLE_IT()

Macros	Description
__HAL_PPP_{SUBLOCK}__EXTI_DISABLE_IT()	Disables a given EXTI line. Example: __HAL_PWR_PVD_EXTI_DISABLE_IT()
__HAL_ PPP_{SUBLOCK}__EXTI_GET_FLAG()	Gets a given EXTI line interrupt flag pending bit status. Example: __HAL_PWR_PVD_EXTI_GET_FLAG()
__HAL_ PPP_{SUBLOCK}_EXTI_CLEAR_FLAG()	Clears a given EXTI line interrupt flag pending bit. Example; __HAL_PWR_PVD_EXTI_CLEAR_FLAG()
__HAL_PPP_SUBBLOCK_EXTI_ENABLE_EVENT()	Enable a given EXTI line event Example: __HAL_PWR_PVD_EXTI_ENABLE_EVENT()
__HAL_PPP_SUBBLOCK_EXTI_DISABLE_EVENT()	Disable a given EXTI line event Example: __HAL_PWR_PVD_EXTI_DISABLE_EVENT()
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_EDGE()	Configure an EXTI interrupt or event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_FALLING_EDGE()	Enable an EXTI interrupt or event on falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_EDGE()	Disable an EXTI interrupt or event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_FALLING_EDGE()	Disable an EXTI interrupt or event on falling edge
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_FALLING_EDGE()	Enable an EXTI interrupt or event on rising/falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_FALLING_EDGE()	Disable an EXTI interrupt or event on rising/falling edge

If the EXTI interrupt mode is selected, the user application must call HAL_PPP_FUNCTION_IRQHandler() (for example HAL_PWR_PVD_IRQHandler()), from stm32n6xx_it.c file, and implement HAL_PPP_FUNCTIONCallback() callback function (for example HAL_PWR_PVDCallback()).

3.11.6 DMA

DMA transfer modes are divided into two main categories:

- Normal transfers (as for legacy series)
- Linked-list transfers

In addition to linked-list capability, all the advanced DMA features are managed and configured via the extended API as extensions to normal mode. The advanced features are repeated block, trigger, and data handling.

For a given channel, enable and configure the peripheral to be connected to the DMA channel (except for internal SRAM and flash memories for which no initialization is required). Refer to the device reference manuals for details on the connection between peripherals and DMA requests.

The normal transfer mode is initialized via the standard API while the Linked-list mode is configured via the extended API.

Alternatively to the normal programming mode, a DMA channel can be programmed by a list of transfers, also known as linked-list (list of node items), each node being defined by its data structure and specifying a standalone DMA channel. When enabled, the DMA channel fetches the first linked-list node from SRAM (also known as head node). When the execution is complete, it fetches and executes the next linked-list node. This operation is repeated until the end of the linked-list queue. The linked-list can be linear or circular:

- Linear linked-list:
  The last linked-list queue node is not linked to another queue node. The DMA channel fetches and executes the whole DMA linked-list queue from the first node (head node) to the last (tail node). When the last node execution is complete, the DMA channel remains in idle state and another transfer can be launched.
- Circular linked-list:
  The last linked-list node can be linked to any linked-list queue node. The DMA channel fetches and executes the whole DMA linked-list queue from the first node to the last. When the last node is executed, the DMA channel fetches again the first circular node and repeats the same sequence in an infinite loop (circular transfer). An abort operation is required to stop the DMA channel. The circular linked-list mode replaces the legacy circular transfer mode.

To reduce linked-list queue execution time and power consumption, the DMA channel supports dynamic linked-list execution in two types of formats, static and dynamic:

- Static linked-list format: this format refers to the full linked-list node where all DMA channel parameters are fetched and executed independently of the redundancy of information.
- Dynamic linked-list: this format refers to the customized linked-list node where only the necessary DMA channel parameters are fetched and executed (for example, no update is required if data size = 20 on previous node, and data size = 20 on the current node).

For linked-list transfers, the DMA channel can execute the linked-list queue node by node. This feature is named link-step mode. When activated, enabling the DMA channel for the first time fetches the head node from memory and stops. Another DMA channel enable is then required to execute the node. After that, the DMA channel must remain enabled to execute each node until the end of the linked-list queue. When the linked-list queue is circular, the DMA channel must be enabled in an infinite loop to keep the DMA channel running. This feature is useful for debug purposes or for executing queue nodes asynchronously.

Each DMA channel transfer (normal or linked-list) can be configured depending on the DMA channel instance embedded in the devices. The configurations are the following:

- Repeated block configuration:
  This feature is also named two-dimension addressing transfer. If it is supported, the DMA channel can perform repeated transfers of programmed blocks (the size of the block transfer is the legacy data size). In addition to the block repeat count, the DMA channel addresses can jump at burst or block level. The jump length is a programmable parameter defined in the user application:
  - Jump at burst level: the DMA channel keeps an empty area between two consecutive transmitted bursts.
  - Jump at block level; the DMA channel keeps an empty area between two consecutive transmitted blocks.
- Trigger configuration:
  The DMA channel transfers can be triggered on the rising or falling edge of a given signal (hardware triggers). The trigger condition can be applied at single/burst level, block level, repeated block level or node level.
  The DMA channel can report a trigger overrun when more than two trigger signal events are detected before executing the current transfer.
- Data handling:
  The data handling feature is based on a FIFO capability that can be:
  - Padding pattern: the padding pattern (zero padding or sign extension) is selected when the source data width is smaller than the destination data width.
  - Truncation: the source data is truncated when the source data width is bigger than the destination data width.
  - Pack/unpack: a set of data can be packed when the source data width is smaller than the destination data width or unpacked when the source data width is bigger than the destination data width.
  - Exchange: data can be exchanged at byte and half-word level on the destination, and byte level on the source.

Each ongoing DMA channel transfer (normal or linked-list) can be suspended and resumed at runtime by the application. When trying to suspend an ongoing transfer, the DMA channel is not suspended instantly. Instead, the ongoing single/burst transfer completes and then stops.

When the DMA channel is suspended, the current transfer can be resumed instantly.

The DMA channel that supports the FIFO can report in real time the number of beats remaining on the destination FIFO ((output).

Two operating modes are available:

- Polling mode I/O operation
  1. Use HAL_DMA_Start() to start DMA transfer when the source and destination addresses and the length of data to be transferred have been configured.
  2. Use HAL_DMA_PollForTransfer() to poll for the end of the current transfer. In this case, a fixed timeout can be configured depending on the user application.
- Interrupt mode I/O operation
  1. Configure the DMA interrupt priority using HAL_NVIC_SetPriority().
  2. Enable the DMA IRQ handler using HAL_NVIC_EnableIRQ().
  3. Use HAL_DMA_Start_IT() to start DMA transfer when the source and destination addresses and the length of data to be transferred have been configured. In this case, the DMA interrupt is configured.
  4. Use HAL_DMA_IRQHandler() called under DMA_IRQHandler() interrupt subroutine.
  5. When data transfer is complete, HAL_DMA_IRQHandler() function is executed and a user function can be called by customizing XferCpltCallback and XferErrorCallback function pointer (that is a member of DMA handle structure).

Additional functions and macros are available to ensure efficient DMA management:

- Use the HAL_DMA_GetState() function to return the DMA state and HAL_DMA_GetError() in case of error detection.
- Use the HAL_DMA_Abort() function to abort the current transfer.

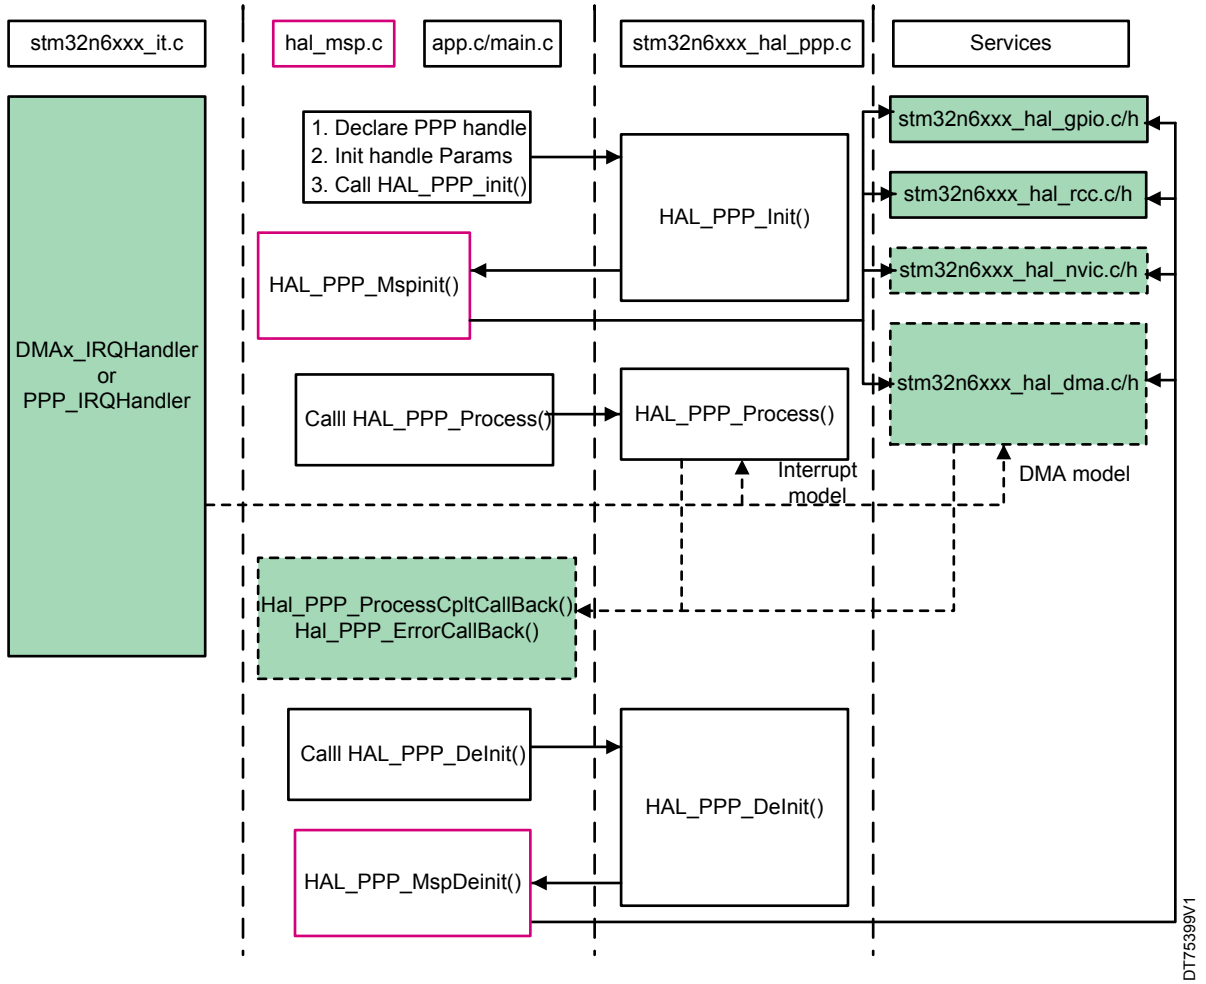
The most used DMA HAL driver macros are the following:

- __HAL_DMA_ENABLE: enables the specified DMA channel
- __HAL_DMA_DISABLE: disables the specified DMA channel
- __HAL_DMA_GET_FLAG: gets the DMA channel pending flags
- __HAL_DMA_CLEAR_FLAG: clears the DMA channel pending flags
- __HAL_DMA_ENABLE_IT: enables the specified DMA channel interrupts
- __HAL_DMA_DISABLE_IT: disables the specified DMA channel interrupts
- __HAL_DMA_GET_IT_SOURCE: checks whether the specified DMA channel interrupt has been enabled or not

To correctly use the DMA linked-list feature, apply the following call sequences:

- Linear transfer:
  - Linked-list queue building
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_ConvertQToDynamic()
  - Linked-list queue execution
    - HAL_DMAEx_List_Init()
    - HAL_DMAEx_List_LinkQ()
    - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
    - HAL_DMAEx_List_UnLinkQ()
    - HAL_DMAEx_List_DeInit()
- Circular transfer:
  - Linked-list queue building
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_SetCircularModeConfig()/HAL_DMAEx_List_SetCircularMode()
    - HAL_DMAEx_List_ConvertQToDynamic()
  - Linked-list queue execution
    - HAL_DMAEx_List_Init()
    - HAL_DMAEx_List_LinkQ()
    - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
    - HAL_DMA_Abort() / HAL_DMA_Abort_IT()
    - HAL_DMAEx_List_UnLinkQ()
    - HAL_DMAEx_List_DeInit()

Note: When a peripheral is used in DMA mode, the DMA initialization must be done in the HAL_PPP_MspInit() callback. In addition, the user application must associate the DMA handle to the PPP handle (refer to section "HAL I/O operation functions").



Note: DMA channel callbacks need to be initialized by the user application only in case of memory-to-memory transfer. However, when peripheral-to-memory transfers are used, these callbacks are automatically initialized by calling a process API function that uses the DMA.

3.12 How to use HAL drivers

3.12.1 HAL usage models

The following figure shows the typical use of the HAL driver and the interaction between the application user, the HAL driver and the interrupts.

Figure 6. **HAL driver model**

Note: The functions implemented in the HAL driver are shown in green, the functions called from interrupt handlers in dotted lines, and the msp functions implemented in the user application in red. Nondotted lines represent the interactions between the user application functions.

Basically, the HAL driver APIs are called from user files and optionally from interrupt handlers file when the APIs based on the DMA or the PPP peripheral dedicated interrupts are used.

When DMA or PPP peripheral interrupts are used, the PPP process complete callbacks are called to inform the user about the process completion in real-time event mode (interrupts). Note that the same process completion callbacks are used for DMA in interrupt mode.

3.12.2 HAL initialization

3.12.2.1 HAL global initialization

In addition to the peripheral initialization and deinitialization functions, a set of APIs are provided to initialize the HAL core implemented in file stm32n6xx_hal.c.

- HAL_Init(): this function must be called at application startup to
  - Initialize data/instruction cache and prefetch queue
  - Set SysTick timer to generate an interrupt each 1 ms (based on HSI clock) with the lowest priority
  - Call HAL_MspInit() user callback function to perform system level initializations (clock, GPIOs, DMA, interrupts). HAL_MspInit() is defined as a “weak” empty function in the HAL drivers.

- HAL_DeInit()
  - Resets all peripherals
  - Calls function HAL_MspDeInit() which is a user callback function to do system level deinitializations.
- HAL_GetTick(): this function gets the current SysTick counter value (incremented in SysTick interrupt) used by peripheral drivers to handle timeouts.
- HAL_Delay(): this function implements a delay (expressed in milliseconds) using the SysTick timer.
  Care must be taken when using HAL_Delay() since this function provides an accurate delay (expressed in milliseconds) based on a variable incremented in SysTick ISR. This means that if HAL_Delay() is called from a peripheral ISR, then the SysTick interrupt must have the highest priority (numerically lower) than the peripheral interrupt, otherwise the caller ISR is blocked.

3.12.2.2 *System clock initialization*

The clock configuration is done at the beginning of the user code. However, the user can change the configuration of the clock in his own code.

Below the typical clock configuration sequence to reach the maximum clock frequency of 600 MHz based on the HSI clock.

```
/**
  * @brief  System Clock Configuration
  *         The system Clock is configured as follows :
  *            CPU Clock source               = IC1_CK
  *            System bus Clock source        = IC2_IC6_IC11_CK
  *            CPUCLK (sysa_ck) (Hz)          = 600000000
  *            SYSCLK AXI (sysb_ck) (Hz)      = 400000000
  *            SYSCLK NPU (sysc_ck) (Hz)      = 300000000
  *            SYSCLK AXISRAM3/4/5/6 (sysd_ck) (Hz) = 400000000
  *            HCLKx(Hz)                      = 200000000
  *            PCLKx(Hz)                      = 200000000
  *            AHB Prescaler                  = 2
  *            APB1 Prescaler                 = 1
  *            APB2 Prescaler                 = 1
  *            APB4 Prescaler                 = 1
  *            APB5 Prescaler                 = 1
  *            PLL1 State                     = ON
  *            PLL1 clock source              = HSI
  *            PLL1 M                         = 4
  *            PLL1 N                         = 75
  *            PLL1 P1                        = 1
  *            PLL1 P2                        = 1
  *            PLL1 FRACN                     = 0
  *            PLL2 State                     = BYPASS
  *            PLL2 clock source              = HSI
  *            PLL3 State                     = BYPASS
  *            PLL3 clock source              = HSI
  *            PLL4 State                     = BYPASS
  *            PLL4 clock source              = HSI
  * @retval None
  */

  RCC_ClkInitStruct.IC11Selection.ClockDivider = 3;

  if (HAL_RCC_ClockConfig(&RCC_ClkInitStruct) != HAL_OK)
  {
    Error_Handler();
  }
```

3.12.2.3 *HAL MSP initialization process*

The peripheral initialization is done through *HAL_PPP_Init()* while the hardware resources initialization used by a peripheral (PPP) is performed during this initialization by calling the MSP callback function *HAL_PPP_MspInit()*.

The MspInit callback performs the low-level initialization related to the different additional hardware resources: RCC, GPIO, NVIC, and DMA.

All the HAL drivers with handles include two MSP callbacks for initialization and deinitialization:

```
/**
* @brief Initializes the PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspInit could be implemented in the user file */
}
/**
* @brief DeInitializes PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspDeInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspDeInit could be implemented in the user file */
}
```

The MSP callbacks are declared empty as weak functions in each peripheral driver. The user can use them to set the low-level initialization code or omit them and use their own initialization routine.

The HAL MSP callback is implemented inside the *stm32n6xx_hal_msp.c* file in the user folders. An *stm32n6xx_hal_msp.c* file template is located in the HAL folder and should be copied to the user folder. It can be generated automatically by the STM32CubeMX tool and further modified. Note that all the routines are declared as weak functions and could be overwritten or removed to use user low-level initialization code.

stm32n6xx_hal_msp.c file contains the following functions:

Table 14. **MSP functions**

Routine	Description
void HAL_MspInit()	Global MSP initialization routine
void HAL_MspDeInit()	Global MSP deinitialization routine
void HAL_PPP_MspInit()	PPP MSP initialization routine
void HAL_PPP_MspDeInit()	PPP MSP deinitialization routine

By default, if no peripheral needs to be deinitialized during the program execution, the whole MSP initialization is done in *Hal_MspInit()* and MSP deinitialization in the *Hal_MspDeInit()*. In this case, the *HAL_PPP_MspInit()* and *HAL_PPP_MspDeInit()* are not implemented.

When one or more peripherals needs to be deinitialized in runtime and the low-level resources of a given peripheral need to be released and used by another peripheral, HAL_PPP_MspDeInit() and *HAL_PPP_MspInit()* are implemented for the concerned peripheral and other peripherals initialization and de-Initialization are kept in the global *HAL_MspInit()* and the *HAL_MspDeInit()*.

If there is nothing to be initialized by the global *HAL_MspInit()* and *HAL_MspDeInit()*, the two routines can simply be omitted.

3.12.3 HAL I/O operation process

The HAL functions with internal data processing like transmit, receive, write, and read are generally provided with three data processing modes as follows:

- Polling mode
- Interrupt mode
- DMA mode

3.12.3.1 Polling mode

In polling mode, the HAL functions return the process status when the data processing in blocking mode is complete. The operation is considered complete when the function returns the HAL_OK status, otherwise an error status is returned. The user can get more information through the *HAL_PPP_GetState()* function. The data processing is handled internally in a loop. A timeout (expressed in ms) is used to prevent process hanging.

The example below shows the typical polling mode processing sequence:

```
HAL_StatusTypeDef HAL_PPP_Transmit ( PPP_HandleTypeDef * phandle, uint8_t pData,
int16_tSize,uint32_tTimeout)
{
if((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
(…) while (data processing is running)
{
if( timeout reached )
{
return HAL_TIMEOUT;
}
}
(…)
return HAL_OK; }
```

3.12.3.2 Interrupt mode

In interrupt mode, the HAL function returns the process status after starting the data processing and enabling the appropriate interruption. The end of the operation is indicated by a callback declared as a weak function. It can be customized by the user to be informed in real time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function.

In interrupt mode, four functions are declared in the driver:

- *HAL_PPP_Process_IT()*: launches the process
- *HAL_PPP_IRQHandler()*: global PPP peripheral interruption

- *__weak HAL_PPP_ProcessCpltCallback ()*: callback relative to the process completion.
- *__weak HAL_PPP_ProcessErrorCallback()*: callback relative to the process error.

To use a process in interrupt mode, *HAL_PPP_Process_IT()* is called in the user file and HAL_PPP_IRQHandler in *stm32n6xx_it.c.*

The *HAL_PPP_ProcessCpltCallback()* function is declared as a weak function in the driver. This means that the user can declare it again in the application. The function in the driver is not modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_SendIT(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
}
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *huart)
{
}
void HAL_UART_ErrorCallback(UART_HandleTypeDef *huart)
{
}
```

stm32n6xx_it.c file:

3.12.3.3 DMA mode

In DMA mode, the HAL function returns the process status after starting the data processing through the DMA and after enabling the appropriate DMA interruption. The end of the operation is indicated by a callback declared as a weak function and can be customized by the user to be informed in real time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function. For the DMA mode, three functions are declared in the driver:

- *HAL_PPP_Process_DMA()*: launch the process
- *HAL_PPP_DMA_IRQHandler()*: the DMA interruption used by the PPP peripheral
- *__weak HAL_PPP_ProcessCpltCallback()*: the callback relative to the process completion.
- *__weak HAL_PPP_ErrorCpltCallback()*: the callback relative to the process error.

To use a process in DMA mode, *HAL_PPP_Process_DMA()* is called in the user file and the *HAL_PPP_DMA_IRQHandler()* is placed in the *stm32n6xx_it.c*. When DMA mode is used, the DMA initialization is done in the *HAL_PPP_MspInit()* callback. The user should also associate the DMA handle with the PPP handle. For this purpose, the handles of all the peripheral drivers that use the DMA must be declared as follows:

```
typedef struct
{
PPP_TypeDef *Instance; /* Register base address */
PPP_InitTypeDef Init; /* PPP communication parameters */
HAL_StateTypeDef State; /* PPP communication state */
(…)
DMA_HandleTypeDef *hdma; /* associated DMA handle */
} PPP_HandleTypeDef;
```

The initialization is done as follows (UART example):

```
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = UART1;
HAL_UART_Init(&UartHandle);
(..)
}
void HAL_USART_MspInit (UART_HandleTypeDef * huart)
{
static DMA_HandleTypeDef hdma_tx;
static DMA_HandleTypeDef hdma_rx;
(…)
__HAL_LINKDMA(UartHandle, DMA_Handle_tx, hdma_tx);
__HAL_LINKDMA(UartHandle, DMA_Handle_rx, hdma_rx);
(…)
}
```

The *HAL_PPP_ProcessCpltCallback()* function is declared as a weak function in the driver that means. The user can declare it again in the application code. The function in the driver must not be modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Paramaters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX; UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_Send_DMA(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
}
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *phuart)
{
}
void HAL_UART_TxErrorCallback(UART_HandleTypeDef *phuart)
{
}
```

stm32n6xx_it.c file:

```
extern UART_HandleTypeDef UartHandle;
void DMAx_IRQHandler(void)
{
HAL_DMA_IRQHandler(&UartHandle.DMA_Handle_tx);
}
```

HAL_USART_TxCpltCallback() and *HAL_USART_ErrorCallback()* should be linked in the *HAL_PPP_Process_DMA()* function to the DMA transfer complete callback and the DMA transfer error callback by using the following statement:

```
HAL_PPP_Process_DMA (PPP_HandleTypeDef *hppp, Params….)
{
(…)
hppp->DMA_Handle->XferCpltCallback = HAL_UART_TxCpltCallback ;
hppp->DMA_Handle->XferErrorCallback = HAL_UART_ErrorCallback ;
(…)
}
```

3.12.4 Timeout and error management

3.12.4.1 Timeout management

The timeout is often used for the APIs that operate in polling mode. It defines the delay during which a blocking process should wait until an error is returned. An example is provided below:

```
HAL_StatusTypeDef HAL_DMA_PollForTransfer(DMA_HandleTypeDef *hdma, uint32_t CompleteLevel, ui
nt32_t Timeout)
```

The timeout possible values are the following:

Table 15. Timeout values

Timeout value	Description
0	No poll: Immediate process check and exit
1 ... (HAL_MAX_DELAY -1) (1)	Timeout in ms
HAL_MAX_DELAY	Infinite poll until the process is successful

1. *HAL_MAX_DELAY is defined in the stm32n6xx_hal_def.h as 0xFFFFFFFF*

However, in some cases, a fixed timeout is used for system peripherals or internal HAL driver processes. In these cases, the timeout has the same meaning and is used in the same way, except when it is defined locally in the drivers and cannot be modified or introduced as an argument in the user application.

Example of fixed timeout:

```
#define LOCAL_PROCESS_TIMEOUT 100
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef *hppp)
{
  (…)
  tickstart = HAL_GetTick();
  (…)
 while (ProcessOngoing)
  {
    (…)
   if ((HAL_GetTick() - tickstart) > LOCAL_PROCESS_TIMEOUT)
    {
      hppp->ErrorCode |= HAL_PPP_ERROR_TIMEOUT;
      hppp->State= HAL_PPP_STATE_READY;
      return HAL_ERROR;
    }
  }
  (…)
}
```

The following example shows how to use the timeout inside the polling functions:

```
HAL_StatusTypeDef HAL_PPP_Poll(PPP_HandleTypeDef *hppp, uint32_t Timeout)
{
  (…)
  tickstart = HAL_GetTick();
  (…)
 while (ProcessOngoing)
  {
    (…)
   if (((HAL_GetTick() - tickstart) > Timeout) || (Timeout == 0))
    {
      hppp->ErrorCode |= HAL_PPP_ERROR_TIMEOUT;
      hppp->State= HAL_PPP_STATE_READY;
      return HAL_ERROR;
    }
  }
  (…)
}
```

3.12.4.2 *Error management*

The HAL drivers implement a check on the following items:

- Valid parameters: for some process the used parameters should be valid and already defined, otherwise the system may crash or go into an undefined state. These critical parameters are checked before being used (see example below).

```
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef* hppp, uint32_t *pdata, uint32 Size
)
{
if ((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
}
```

- Valid handle: the PPP peripheral handle is the most important argument since it keeps the PPP driver vital parameters. It is always checked in the beginning of the *HAL_PPP_Init()* function.

```
HAL_StatusTypeDef HAL_PPP_Init(PPP_HandleTypeDef* hppp)
{
if (hppp == NULL) //the handle should be already allocated
{
return HAL_ERROR;
}
}
```

- Timeout error: the following statement is used when a timeout error occurs:

```
while (Process ongoing)
{
timeout = HAL_GetTick() + Timeout; while (data processing is running)
{
if(timeout) { return HAL_TIMEOUT;
}
}
```

When an error occurs during a peripheral process, *HAL_PPP_Process ()* returns with a *HAL_ERROR* status. The HAL PPP driver implements the *HAL_PPP_GetError ()* to retrieve the origin of the error.

```
HAL_PPP_ErrorTypeDef HAL_PPP_GetError (PPP_HandleTypeDef *hppp);
```

In all peripheral handles, a *HAL_PPP_ErrorTypeDef* is defined and used to store the last error code.

```
typedef struct
{
PPP_TypeDef * Instance; /* PPP registers base address */
PPP_InitTypeDef Init; /* PPP initialization parameters */
HAL_LockTypeDef Lock; /* PPP locking object */
__IO HAL_PPP_StateTypeDef State; /* PPP state */
__IO HAL_PPP_ErrorTypeDef ErrorCode; /* PPP Error code */
(…)
/* PPP specific parameters */
}
PPP_HandleTypeDef;
```

The error state and the peripheral global state are always updated before returning an error:

```
PPP->State = HAL_PPP_READY;  /* Set the peripheral ready */
PP->ErrorCode = HAL_ERRORCODE ; /* Set the error code */
_HAL_UNLOCK(PPP) ; /* Unlock the PPP resources */
return HAL_ERROR;  /*return with HAL error */
```

HAL_PPP_GetError () must be used in interrupt mode in the error callback:

```
void HAL_PPP_ProcessCpltCallback(PPP_HandleTypeDef *hspi)
{
ErrorCode = HAL_PPP_GetError (hppp); /* retreive error code */
}
```

3.12.4.3 *Runtime checking*

The HAL implements runtime failure detection by checking the input values of all HAL driver functions. The runtime checking is achieved by using an *assert_param* macro. This macro is used in all the HAL driver functions which have an input parameter. It verifies that the input value lies within the parameter allowed values.

To enable the runtime checking, use the *assert_param* macro, and leave the define ***USE_FULL_ASSERT*** uncommented in the *stm32n6xx_hal_conf.h* file.

```
void HAL_UART_Init(UART_HandleTypeDef *huart)
{
(..) /* Check the parameters */
assert_param(IS_UART_INSTANCE(huart->Instance));
assert_param(IS_UART_BAUDRATE(huart->Init.BaudRate));
assert_param(IS_UART_WORD_LENGTH(huart->Init.WordLength));
assert_param(IS_UART_STOPBITS(huart->Init.StopBits));
assert_param(IS_UART_PARITY(huart->Init.Parity));
assert_param(IS_UART_MODE(huart->Init.Mode));
assert_param(IS_UART_HARDWARE_FLOW_CONTROL(huart->Init.HwFlowCtl));
(..)
```

```
/** @defgroup UART_Word_Length *
@{
*/
#define UART_WORDLENGTH_8B ((uint32_t)0x00000000)
#define UART_WORDLENGTH_9B ((uint32_t)USART_CR1_M)
#define IS_UART_WORD_LENGTH(LENGTH) (((LENGTH) == UART_WORDLENGTH_8B) ||
\ ((LENGTH) == UART_WORDLENGTH_9B))
```

If the expression passed to the assert_param macro is false, the*assert_failed* function is called and returns the name of the source file and the source line number of the call that failed. If the expression is true, no value is returned.

The *assert_param* macro is implemented in stm32n6xx_hal_conf.h:

```
/* Exported macro ------------------------------------------------------------*/
#ifdef USE_FULL_ASSERT
/**
* @brief The assert_param macro is used for function's parameters check.
* @param expr: If expr is false, it calls assert_failed function
* which reports the name of the source file and the source
* line number of the call that failed.
* If expr is true, it returns no value.
* @retval None */
#define assert_param(expr) ((expr)?(void)0:assert_failed((uint8_t *)__FILE__, __LINE__))
/* Exported functions --------------------------------------*/
void assert_failed(uint8_t* file, uint32_t line);
#else
#define assert_param(expr)((void)0)
#endif /* USE_FULL_ASSERT */
```

The *assert_failed* function is implemented in the main.c file or in any other user C file:

```
#ifdef USE_FULL_ASSERT /**
* @brief Reports the name of the source file and the source line number
* where the assert_param error has occurred.
* @param file: pointer to the source file name
* @param line: assert_param error line source number
* @retval None */
void assert_failed(uint8_t* file, uint32_t line)
{
/* User can add his own implementation to report the file name and line number,
ex: printf("Wrong parameters value: file %s on line %d\r\n", file, line) */
/* Infinite loop */
while (1)
{
}
}
```

Attention: ***Because of the overhead runtime checking introduces, it is recommended to use it during application code development and debugging, and to remove it from the final application to improve code size and speed.***

4 Overview of low-layer drivers

The low-layer (LL) drivers are designed to offer a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. Contrary to the HAL, LL APIs are not provided for peripherals where optimized access is not a key feature, or those requiring heavy software configuration and/or complex upper-level stack (such as USB).

The LL drivers feature:

- A set of functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Functions to perform peripheral deinitialization (peripheral registers restored to their default values)
- A set of inline functions for direct and atomic register access
- Full independence from HAL since LL drivers can be used either in standalone mode (without HAL drivers) or in mixed mode (with HAL drivers)
- Full coverage of the supported peripheral features

The low-layer drivers provide hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities and provide one-shot operations that must be called following the programming model described in the microcontroller line reference manual. As a result, the LL services do not implement any processing and do not require any additional memory resources to save their states, counter, or data pointers: all the operations are performed by changing the associated peripheral registers content.

4.1 Low-layer files

The low-layer drivers are built around header/C files (one per each supported peripheral) plus five header files for some system and Cortex related features.

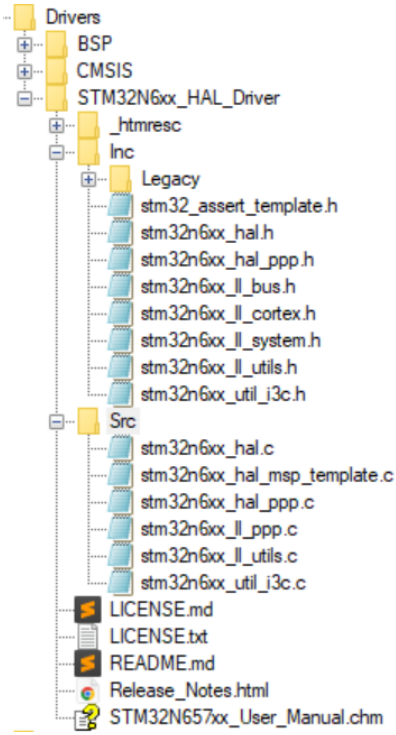

Table 16. LL driver files

File	Description
stm32n6xx_ll_bus.h	This is the h-source file for core bus control and peripheral clock activation and deactivation *Example: LL_AHB2_GRP1_EnableClock*
stm32n6xx_ll_ppp.h/.c	stm32n6xx_ll_ppp.c provides peripheral initialization functions such as LL_PPP_Init(), LL_PPP_StructInit(), LL_PPP_DeInit(). All the other APIs are defined within the stm32n6xx_ll_ppp.h file. The low-layer PPP driver is a standalone module. To use it, the application must include it in the stm32n6xx_ll_ppp.h file.
stm32n6xx_ll_cortex.h	Cortex-M related register operation APIs including the SysTick, low power (such as LL_SYSTICK_xxxxx and LL_LPM_xxxxx "Low Power Mode")
stm32n6xx_ll_utils.h/.c	This file covers the generic APIs: • Read of device unique ID and electronic signature • Timebase and delay management • System clock configuration.
stm32n6xx_ll_system.h	System-related operations. Example: LL_SBS_xxx, LL_DBGMCU_xxx and LL_FLASH_xxx
stm32_assert_template.h	Template file defines the assert_param macro that is used when runtime checking is enabled. This file is required only when the LL drivers are used in standalone mode (without calling the HAL APIs). It should be copied to the application folder and renamed to stm32_assert.h.

Note: There is no configuration file for the LL drivers.

The low-layer files are located in the same HAL driver folder.

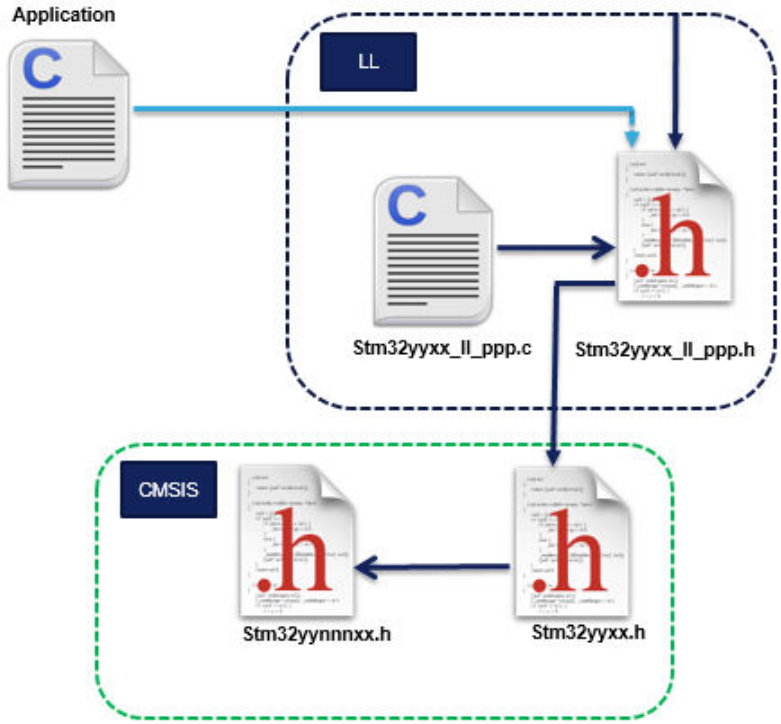

Figure 7. **Low-layer driver folders**

In general, low-layer drivers include only the STM32 CMSIS device file.

```
#include "stm32yyxx.h"
```

Figure 8. **Low-layer driver CMSIS files**

Application files have to include only the used low-layer driver header files.

4.2 Overview of low-layer APIs and naming rules

4.2.1 Peripheral initialization functions

The LL drivers offer three sets of initialization functions. They are defined in the stm32n6xx_ll_ppp.c file:

- Functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Function for peripheral deinitialization (peripheral registers restored to their default values)

The definition of these LL initialization functions and associated resources (structure, literals, and prototypes) is conditioned by a compilation switch: *USE_FULL_LL_DRIVER*. To use these functions, this switch must be added in the toolchain compiler preprocessor or to any generic header file which is processed before the LL drivers.

The below table shows the list of the common functions provided for all the supported peripherals:

Table 17. Common peripheral initialization functions

Functions	Return type	Parameters	Description
LL_PPP_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_InitTypeDef* PPP_InitStruct*	Initializes the peripheral main features according to the parameters specified in PPP_InitStruct. Example: LL_USART_Init(USART_TypeDef *USARTx, LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_StructInit	*void*	• *LL_PPP_InitTypeDef* PPP_InitStruct*	Fills each PPP_InitStruct member with its default value. Example. LL_USART_StructInit(LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_DeInit	*ErrorStatus*	• *PPP_TypeDef* PPPx*	Deinitializes the peripheral registers that is restore them to their default reset values. Example. LL_USART_DeInit(USART_TypeDef *USARTx)

Additional functions are available for some peripherals (refer to Table 18. Optional peripheral initialization functions).

Table 18. Optional peripheral initialization functions

Functions	Return type	Parameters	Examples
LL_PPP{_CATEGORY}_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Initializes peripheral features according to the parameters specified in PPP_InitStruct. Example: LL_ADC_INJ_Init(ADC_TypeDef *ADCx, LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct) LL_RTC_TIME_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_TimeTypeDef *RTC_TimeStruct) LL_RTC_DATE_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_DateTypeDef *RTC_DateStruct) LL_TIM_IC_Init(TIM_TypeDef* TIMx, uint32_t Channel, LL_TIM_IC_InitTypeDef* TIM_IC_InitStruct) LL_TIM_ENCODER_Init(TIM_TypeDef* TIMx, LL_TIM_ENCODER_InitTypeDef* TIM_EncoderInitStruct)
LL_PPP{_CATEGORY}_StructInit	*void*	*LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Fills each *PPP{_CATEGORY}_InitStruct* member with its default value. Example: LL_ADC_INJ_StructInit(LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct)

Functions	Return type	Parameters	Examples
LL_PPP_CommonInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Initializes the common features shared between different instances of the same peripheral. Example: LL_ADC_CommonInit(ADC_Common_TypeDef *ADCxy_COMMON, LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_CommonStructInit	*void*	*LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Fills each *PPP_CommonInitStruct* member with its default value Example: LL_ADC_CommonStructInit(LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_ClockInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Initializes the peripheral clock configuration in synchronous mode. Example: LL_USART_ClockInit(USART_TypeDef *USARTx, LL_USART_ClockInitTypeDef *USART_ClockInitStruct)
LL_PPP_ClockStructInit	*void*	*LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Fills each *PPP_ClockInitStruct* member with its default value Example: LL_USART_ClockStructInit(LL_USART_ClockInitTypeDef *USART_ClockInitStruct)

4.2.1.1 *Runtime checking*

Like HAL drivers, LL initialization functions implement runtime failure detection by checking the input values of all LL driver functions. For more details, refer to Section 3.12.4.3: Runtime checking.

When using the LL drivers in standalone mode (without calling HAL functions), the following actions are required to use runtime checking:

1. Copy stm32_assert_template.h to the application folder and rename it to stm32_assert.h. This file defines the assert_param macro which is used when runtime checking is enabled.
2. Include the stm32_assert.h file within the application main header file.
3. Add the USE_FULL_ASSERT compilation switch in the toolchain compiler preprocessor or in any generic header file which is processed before the stm32_assert.h driver.

Note: Runtime checking is not available for LL inline functions.

4.2.2 Peripheral register-level configuration functions

On top of the peripheral initialization functions, the LL drivers offer a set of inline functions for direct atomic register access. Their format is as follows:

```
__STATIC_INLINE return_type LL_PPP_Function (PPPx_TypeDef *PPPx, args)
```

The “Function” naming is defined depending on the action category:

- **Specific interrupt, DMA request and status flags management**: Set/Get/Clear/Enable/Disable flags on interrupt and status registers

Table 19. Specific interrupt, DMA request and status flags management

Name	Examples
LL_PPP_{_CATEGORY}_ActionItem_BITNAME *LL_PPP{_CATEGORY}_IsItem_BITNAME_Action*	• LL_RCC_IsActiveFlag_LSIRDY • LL_RCC_IsActiveFlag_FWRST() • LL_ADC_ClearFlag_EOC(ADC1) • LL_DMA_ClearFlag_TCx(DMA_TypeDef* DMAx)

Table 20. Available function formats

Item	Action	Format
Flag	Get	*LL_PPP_IsActiveFlag_BITNAME*
	Clear	*LL_PPP_ClearFlag_BITNAME*

Item	Action	Format
Interrupts	Enable	*LL_PPP_EnableIT_BITNAME*
	Disable	*LL_PPP_DisableIT_BITNAME*
	Get	*LL_PPP_IsEnabledIT_BITNAME*
DMA	Enable	*LL_PPP_EnableDMAReq_BITNAME*
	Disable	*LL_PPP_DisableDMAReq_BITNAME*
	Get	*LL_PPP_IsEnabledDMAReq_BITNAME*

Note: BITNAME refers to the peripheral register bit name as described in the product line reference manual.

- **Peripheral clock activation/deactivation management**: Enable/Disable/Reset a peripheral clock

Table 21. Peripheral clock activation/deactivation management

Name	Examples
LL_BUS_GRPx_ActionClock{Mode}	• *LL_AHB2_GRP1_EnableClock (LL_AHB2_GRP1_PERIPH_GPIOA| LL_AHB2_GRP1_PERIPH_GPIOB)* • *LL_APB1_GRP1_EnableClockSleep (LL_APB1_GRP1_PERIPH_DAC1)*

Note: 'x' corresponds to the group index and refers to the index of the modified register on a given bus. 'bus' corresponds to the bus name.

- ***Peripheral activation/deactivation management:*** Enable/disable a peripheral or activate/deactivate specific peripheral features

Table 22. Peripheral activation/deactivation management

Name	Examples
LL_PPP{_CATEGORY}_Action{Item} *LL_PPP{_CATEGORY}_IsItemAction*	• *LL_ADC_Enable ()* • *LL_ADC_StartCalibration();* • *LL_ADC_IsCalibrationOnGoing;* • *LL_RCC_HSI_Enable ()* • *LL_RCC_HSI_IsReady()*

- ***Peripheral configuration management:*** Set/get a peripheral configuration setting

Table 23. Peripheral configuration management

Name	Examples
LL_PPP{_CATEGORY}_Set{ or Get}ConfigItem	*LL_USART_SetBaudRate (USART2, Clock, LL_USART_BAUDRATE_9600)*

- ***Peripheral register management:*** Write/read the content of a register/retrun DMA relative register address

Table 24. Peripheral register management

Name
LL_PPP_WriteReg(__INSTANCE__, __REG__, __VALUE__)
LL_PPP_ReadReg(__INSTANCE__, __REG__)
*LL_PPP_DMA_GetRegAddr (PPP_TypeDef *PPPx,{Sub Instance if any ex: Channel} , {uint32_t Propriety})*

Note: The Propriety is a variable used to identify the DMA transfer direction or the data register type.

5 Cohabiting of HAL and LL

The low-ayer APIs are designed to be used in standalone mode or combined with the HAL. They cannot be automatically used with the HAL for the same peripheral instance. If you use the LL APIs for a specific instance, you can still use the HAL APIs for other instances. Be careful that the low-layer APIs might overwrite some registers which content is mirrored in the HAL handles.

5.1 Low-layer driver used in standalone mode

The low-layer APIs can be used without calling the HAL driver services. This is done by simply including stm32n6xx_ll_ppp.h in the application files. The LL APIs for a given peripheral are called by executing the same sequence as the one recommended by the programming model in the corresponding product line reference manual. In this case, the HAL drivers associated to the used peripheral can be removed from the workspace. However, the STM32CubeN6 framework should be used in the same way as in the HAL drivers case which means that system file, startup file and CMSIS should always be used.

Note: When the BSP drivers are included, the used HAL drivers associated with the BSP functions drivers should be included in the workspace, even if they are not used by the application layer.

5.2 Mixed use of low-layer APIs and HAL drivers

In this case, the low-layer APIs are used in conjunction with the HAL drivers to achieve direct and register level-based operations.

Mixed use is allowed, however some consideration should be taken into account:

- It is recommended to avoid using simultaneously the HAL APIs and the combination of low-layer APIs for a given peripheral instance. If this is the case, one or more private fields in the HAL PPP handle structure should be updated accordingly.
- For operations and processes that do not alter the handle fields including the initialization structure, the HAL driver APIs and the low-layer services can be used together for the same peripheral instance.
- The low-layer drivers can be used without any restriction with all the HAL drivers that are not based on handle objects (RCC, common HAL, flash, and GPIO).

Several examples showing how to use HAL and LL in the same application are provided within the stm32n6xx firmware package (refer to Examples_MIX projects).

Note:

1. *When the HAL Init/DeInit APIs are not used and are replaced by the low-layer macros, the InitMsp() functions are not called and the MSP initialization should be done in the user application.*
2. *When process APIs are not used and the corresponding function is performed through the low-layer APIs, the callbacks are not called and post processing or error management should be done by the user application.*
3. *When the LL APIs is used for process operations, the IRQ handler HAL APIs cannot be called and the IRQ should be implemented by the user application. Each LL driver implements the macros needed to read and clear the associated interrupt flags.*

6 HAL System Driver

6.1 HAL Firmware driver API description

The following section lists the various functions of the HAL library.

6.1.1 How to use this driver

The common HAL driver contains a set of generic and common APIs that can be used by the PPP peripheral drivers and the user to start using the HAL.

The HAL contains two APIs' categories:

- Common HAL APIs
- Services HAL APIs

All the SYSCFG functions have the same privilege and security attributes.

- Functions can operate in non-privileged code should privileged and unprivileged data access are granted to the peripheral (see HAL_RIF_RISC_SetSlaveSecureAttributes)
- Functions can operate in non-secure code should secure and non-secure data access are granted to the peripheral (see HAL_RIF_RISC_SetSlaveSecureAttributes).

6.1.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initializes the NVIC allocation and initial clock configuration. It initializes the systick also when timeout is needed and the backup domain when enabled.
- De-Initializes common part of the HAL.
- Configure The time base source to have 1ms time base with a dedicated Tick interrupt priority.
  - SysTick timer is used by default as source of time base, but user can eventually implement his proper time base source (a general purpose timer for example or other time source), keeping in mind that Time base duration should be kept 1ms since PPP_TIMEOUT_VALUEs are defined and handled in milliseconds basis.
  - Time base configuration function (HAL_InitTick ()) is called automatically at the beginning of the program after reset by HAL_Init() or at any time when clock is configured, by HAL_RCC_ClockConfig().
  - Source of time base is configured to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, the Tick interrupt line must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked.
  - functions affecting time base configurations are declared as __weak to make override possible in case of other implementations in user file.

This section contains the following APIs:

- ***HAL_Init()***
- ***HAL_DeInit()***
- ***HAL_MspInit()***
- ***HAL_MspDeInit()***
- ***HAL_InitTick()***

6.1.3 HAL Control functions

This section provides functions allowing to:

- Provide a tick value in millisecond
- Provide a blocking delay in millisecond
- Suspend the time base source interrupt
- Resume the time base source interrupt
- Get the HAL API driver version

- Get the device identifier
- Get the device revision identifier
- Enable/Disable Debug module during SLEEP mode
- Enable/Disable Debug module during STOP mode
- Enable/Disable Debug module during STANDBY mode

This section contains the following APIs:

- ***HAL_IncTick()***
- ***HAL_GetTick()***
- ***HAL_GetTickPrio()***
- ***HAL_SetTickFreq()***
- ***HAL_GetTickFreq()***
- ***HAL_Delay()***
- ***HAL_SuspendTick()***
- ***HAL_ResumeTick()***
- ***HAL_GetHalVersion()***
- ***HAL_GetREVID()***
- ***HAL_GetDEVID()***
- ***HAL_GetUIDw0()***
- ***HAL_GetUIDw1()***
- ***HAL_GetUIDw2()***

6.1.4 HAL Debug functions

This section provides functions allowing to:

- Enable/Disable Debug module during Sleep mode
- Enable/Disable Debug module during Stop modes
- Enable/Disable Debug module during Stanby mode

This section contains the following APIs:

- ***HAL_DBGMCU_EnableDBGSleepMode()***
- ***HAL_DBGMCU_DisableDBGSleepMode()***
- ***HAL_DBGMCU_EnableDBGStopMode()***
- ***HAL_DBGMCU_DisableDBGStopMode()***
- ***HAL_DBGMCU_EnableDBGStandbyMode()***
- ***HAL_DBGMCU_DisableDBGStandbyMode()***

6.1.5 HAL SYSCFG configuration functions

This section provides functions allowing to:

- Enable or disable BOOT pins pull-down.
- Lock and get locks status of system items.
- Set (and get) TCM size and DTCM size.
- Lock (and get) write accesses.
- Enable or disable wait state on extended ITCM and DTCM.
- Enable or disable external RW margin input for TCM memories.
- Set and get the TCM biasing level.
- Enable or disable the external RW for caches memories.
- Set and get the cache biasing level.
- Enable or disable the Power-on reset upon SW system request.
- Enable or disable that Lockup requests a warm reset to the RCC
- Enable or disable that Lockup generates a NMI on the core
- Clear Error capture in write posting buffer

- Reserve VENCRAM for VENC or release it (any use allowed)
- Enable or disable PKA, SAES, CRYP1/2 and HASH reset in case of potential tamper
- Set/Get write/read Qos for NP1, NP2 or CPU.
- Enable or disable SDMMC early-write response.
- Enable or disable USB early-write response.
- Enable or disable the NPU NIC, NPU NOC or CPU NOC clock gating.
- Enable or disable the VDDIOx compensation cell.
- Configure or get VDDIOx compensation cells.
- Get VDDIOx compensation ready status.
- Enable or disable the VDD compensation cell.
- Configure or get VDD compensation cells.
- Configure or get the Timer Break input for error flag
- Set and get secure OS allocation of specific CID to the DMA channel
- Set and get non-secure OS allocation of specific CID to the DMA channel
- Enable or disable Retiming on RX path.
- Enable or disable Retiming on TX path.
- Set and get Delay on feedback clock.
- Enable or disable the interleaving on NPU RAM.
- Get BOOT pin connection status
- Get the address of first error in P-AHB write-posting buffer

This section contains the following APIs:

- ***HAL_SYSCFG_EnablePullDown()***
- ***HAL_SYSCFG_DisablePullDown()***
- ***HAL_SYSCFG_Lock()***
- ***HAL_SYSCFG_GetLock()***
- ***HAL_SYSCFG_SetTCMSize()***
- ***HAL_SYSCFG_GetTCMSize()***
- ***HAL_SYSCFG_LockWriteAccess()***
- ***HAL_SYSCFG_GetLockWriteAccess()***
- ***HAL_SYSCFG_EnableITCMWaiteState()***
- ***HAL_SYSCFG_DisableITCMWaiteState()***
- ***HAL_SYSCFG_EnableDTCMWaiteState()***
- ***HAL_SYSCFG_DisableDTCMWaiteState()***
- ***HAL_SYSCFG_EnableTCMExternalMargin()***
- ***HAL_SYSCFG_DisableTCMExternalMargin()***
- ***HAL_SYSCFG_SetTCMRWMarginInput()***
- ***HAL_SYSCFG_GetTCMRWMarginInput()***
- ***HAL_SYSCFG_SetTCMBiasingLevel()***
- ***HAL_SYSCFG_GetTCMBiasingLevel()***
- ***HAL_SYSCFG_EnableCacheExternalMargin()***
- ***HAL_SYSCFG_DisableCacheExternalMargin()***
- ***HAL_SYSCFG_SetCacheRWMarginInput()***
- ***HAL_SYSCFG_GetCacheRWMarginInput()***
- ***HAL_SYSCFG_SetCacheBiasingLevel()***
- ***HAL_SYSCFG_GetCacheBiasingLevel()***
- ***HAL_SYSCFG_SetSVTORAddress()***
- ***HAL_SYSCFG_GetSVTORAddress()***
- ***HAL_SYSCFG_SetNSVTORAddress()***
- ***HAL_SYSCFG_GetNSVTORAddress()***
- ***HAL_SYSCFG_EnablePowerOnReset()***

6.1.6 Detailed description of functions

HAL_Init

Function name

HAL_StatusTypeDef HAL_Init (void)

Function description

Configure the time base source, NVIC and any required global low level hardware by calling the HAL_MspInit() callback function to be optionally defined in user file stm32n6xx_hal_msp.c.

Return values

- **HAL:** status

Notes

- HAL_Init() function is called at the beginning of program after reset and before the clock configuration.
- In the default implementation the System Timer (Systick) is used as source of time base. The Systick configuration is based on HSI clock, as HSI is the clock used after a system Reset and the NVIC configuration is set to Priority group 4. Once done, time base tick starts incrementing: the tick variable counter is incremented each 1ms in the SysTick_Handler() interrupt handler.

HAL_DeInit

Function name

HAL_StatusTypeDef HAL_DeInit (void)

Function description

This function de-initializes all peripherals and low level hardware resources.

Return values

- **HAL:** status

Notes

- This function should only be called from code running in internal RAM since it resets the external peripheral memory interfaces.
- This function is optional.

HAL_MspInit

Function name

void HAL_MspInit (void)

Function description

Initializes the MSP.

Return values

- **None:**

HAL_MspDeInit

Function name

void HAL_MspDeInit (void)

Function description

DeInitializes the MSP.

Return values

- **None:**

HAL_InitTick

Function name

HAL_StatusTypeDef HAL_InitTick (uint32_t TickPriority)

Function description

This function configures the source of the time base.

Parameters

- **TickPriority:** Tick interrupt priority.

Return values

- **HAL:** status

Notes

- This function is called automatically at the beginning of program after reset by HAL_Init() or at any time when clock is reconfigured by HAL_RCC_ClockConfig().
- In the default implementation, SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, The SysTick interrupt must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked. The function is declared as __weak to be overwritten in case of other implementation in user file.

HAL_IncTick

Function name

void HAL_IncTick (void)

Function description

This function is called to increment a global variable "uwTick" used as application time base.

Return values

- **None:**

Notes

- In the default implementation, this variable is incremented each 1ms in Systick ISR.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_Delay

Function name

void HAL_Delay (uint32_t Delay)

Function description

This function provides minimum delay (in milliseconds) based on variable incremented.

Parameters

- **Delay:** Specifies the delay time length, in milliseconds.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals where uwTick is incremented.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTick

Function name

uint32_t HAL_GetTick (void)

Function description

Provides a tick value in millisecond.

Return values

- **tick:** value

Notes

- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTickPrio

Function name

uint32_t HAL_GetTickPrio (void)

Function description

This function returns a tick priority.

Return values

- **tick:** priority

HAL_SetTickFreq

Function name

HAL_StatusTypeDef HAL_SetTickFreq (HAL_TickFreqTypeDef Freq)

Function description

Set new tick Freq.

Parameters

- **Freq:** Tick frequency, value of HAL_TickFreqTypeDef.

Return values

- **HAL:** status

HAL_GetTickFreq

Function name

HAL_TickFreqTypeDef HAL_GetTickFreq (void)

Function description

Return tick frequency.

Return values

- **Tick:** frequency. Value of HAL_TickFreqTypeDef.

HAL_SuspendTick

Function name

void HAL_SuspendTick (void)

Function description

Suspend Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_SuspendTick() is called, the SysTick interrupt will be disabled and so Tick increment is suspended.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_ResumeTick

Function name

void HAL_ResumeTick (void)

Function description

Resume Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_ResumeTick() is called, the SysTick interrupt will be enabled and so Tick increment is resumed.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetHalVersion

Function name

uint32_t HAL_GetHalVersion (void)

Function description

Returns the HAL revision.

Return values

- **version:** : 0xXYZR (8bits for each decimal, R for RC)

HAL_GetREVID

Function name

uint32_t HAL_GetREVID (void)

Function description

Returns the device revision identifier.

Return values

- **Device:** revision identifier

Notes

- Returned Revision ID can be 0x00000100 for Cut1.0 0x00000101 for Cut1.1 0x00000200 for Cut2.0

HAL_GetDEVID

Function name

uint32_t HAL_GetDEVID (void)

Function description

Returns the device identifier.

Return values

- **Device:** identifier

Notes

- This function can only be used if the HAL BSEC module is enabled in the hal configuration file. The BSEC clock must be enabled before calling this function Returned Device ID can be 0x00006200 for STM32N645xx 0x00006000 for STM32N655xx 0x00002200 for STM32N647xx 0x00002000 for STM32N657xx 0xFFFFFFFF if an error occurs

HAL_GetUIDw0

Function name

uint32_t HAL_GetUIDw0 (void)

Function description

Return the first word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

Notes

- The application must ensures that SYSCFG clock is enabled.

HAL_GetUIDw1

Function name

uint32_t HAL_GetUIDw1 (void)

Function description

Return the second word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

Notes

- The application must ensures that SYSCFG clock is enabled.

HAL_GetUIDw2

Function name

uint32_t HAL_GetUIDw2 (void)

Function description

Return the third word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

Notes

- The application must ensures that SYSCFG clock is enabled.

HAL_DBGMCU_EnableDBGSleepMode

Function name

void HAL_DBGMCU_EnableDBGSleepMode (void)

Function description

Enable the Debug Module during Sleep mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGSleepMode

Function name

void HAL_DBGMCU_DisableDBGSleepMode (void)

Function description

Disable the Debug Module during Sleep mode.

Return values

- **None:**

HAL_DBGMCU_EnableDBGStopMode

Function name

void HAL_DBGMCU_EnableDBGStopMode (void)

Function description

Enable the Debug Module during Stop mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStopMode

Function name

void HAL_DBGMCU_DisableDBGStopMode (void)

Function description

Disable the Debug Module during Stop mode.

Return values

- **None:**

HAL_DBGMCU_EnableDBGStandbyMode

Function name

void HAL_DBGMCU_EnableDBGStandbyMode (void)

Function description

Enable the Debug Module during Stanby mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStandbyMode

Function name

void HAL_DBGMCU_DisableDBGStandbyMode (void)

Function description

Disable the Debug Module during Stanby mode.

Return values

- **None:**

HAL_SYSCFG_EnablePullDown

Function name

void HAL_SYSCFG_EnablePullDown (uint32_t BootId)

Function description

Enable the Pull Down on BOOT pin.

Parameters

- **BootId:** Specifies the boot pins. This parameter can one of the following values:
  - SYSCFG_BOOT_0 boot 0 pin
  - SYSCFG_BOOT_1 boot 1 pin

Return values

- **None:**

HAL_SYSCFG_DisablePullDown

Function name

void HAL_SYSCFG_DisablePullDown (uint32_t BootId)

Function description

Disable the Pull Down on BOOT pin.

Parameters

- **BootId:** Specifies the boot pins. This parameter can one of the following values:
  - SYSCFG_BOOT_0 boot 0 pin
  - SYSCFG_BOOT_1 boot 1 pin

Return values

- **None:**

HAL_SYSCFG_Lock

Function name

void HAL_SYSCFG_Lock (uint32_t Item)

Function description

Lock the SYSCFG item(s).

Parameters

- **Item:** Item(s) to set lock on. This parameter can be a combination of SYSCFG Lock items

Return values

- **None:**

Notes

- Lock(s) cleared only at system reset

HAL_SYSCFG_GetLock

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetLock (uint32_t * pItem)

Function description

Get the lock state of SYSCFG item.

Parameters

- **pItem:** Pointer to return locked items the return value can be a combination of SYSCFG Lock items

Return values

- **HAL:** status

HAL_SYSCFG_SetTCMSize

Function name

void HAL_SYSCFG_SetTCMSize (uint32_t DtcmSize, uint32_t ItcmSize)

Function description

Set the DTCM and ITCM memory sizes.

Parameters

- **DtcmSize:** DTCM memory size This parameter can one of the following values:
  - SYSCFG_DTCM_128K 128K
  - SYSCFG_DTCM_256K 256K
- **ItcmSize:** ITCM memory size This parameter can one of the following values:
  - SYSCFG_ITCM_64K 64K
  - SYSCFG_ITCM_128K 128K
  - SYSCFG_ITCM_256K 256K

Return values

- **None:**

Notes

- Write-once TCM configuration change.
- Effective change applied upon new power-on reset by calling HAL_SYSCFG_EnablePowerOnReset() and NVIC_SystemReset()

HAL_SYSCFG_GetTCMSize

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetTCMSize (uint32_t * pDtcmSize, uint32_t * pItcmSize)

Function description

Get the DTCM and ITCM memory sizes.

Parameters

- **pDtcmSize:** Pointer to return DTCM memory size This return value can be one of
  - SYSCFG_DTCM_128K 128K
  - SYSCFG_DTCM_256K 256K
- **pItcmSize:** Pointer to return ITCM memory size This return value can be one of
  - SYSCFG_ITCM_64K 64K
  - SYSCFG_ITCM_128K 128K
  - SYSCFG_ITCM_256K 256K

Return values

- **HAL:** status

HAL_SYSCFG_LockWriteAccess

Function name

void HAL_SYSCFG_LockWriteAccess (uint32_t Item)

Function description

Lock the SYSCFG write access item(s).

Parameters

- **Item:** Item(s) to set lock on. This parameter can be a combination of WRITE access selection

Return values

- **None:**

Notes

- Lock(s) cleared only at system reset

HAL_SYSCFG_GetLockWriteAccess

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetLockWriteAccess (uint32_t * pItem)

Function description

Get the lock state of SYSCFG write access item.

Parameters

- **pItem:** pointer to return locked items the return value can be a combination of WRITE access selection

Return values

- **HAL:** status

HAL_SYSCFG_EnableITCMWaiteState

Function name

void HAL_SYSCFG_EnableITCMWaiteState (void)

Function description

Enable the ITCM Wait State.

Return values

- **None:**

HAL_SYSCFG_DisableITCMWaiteState

Function name

void HAL_SYSCFG_DisableITCMWaiteState (void)

Function description

Disable the ITCM Wait State.

Return values

- **None:**

HAL_SYSCFG_EnableDTCMWaiteState

Function name

void HAL_SYSCFG_EnableDTCMWaiteState (void)

Function description

Enable the DTCM Wait State.

Return values

- **None:**

HAL_SYSCFG_DisableDTCMWaiteState

Function name

void HAL_SYSCFG_DisableDTCMWaiteState (void)

Function description

Disable the DTCM Wait State.

Return values

- **None:**

HAL_SYSCFG_EnableTCMExternalMargin

Function name

void HAL_SYSCFG_EnableTCMExternalMargin (void)

Function description

Enable external RW margin inputs for TCM memories.

Return values

- **None:**

HAL_SYSCFG_DisableTCMExternalMargin

Function name

void HAL_SYSCFG_DisableTCMExternalMargin (void)

Function description

Disable external RW margin inputs for TCM memories.

Return values

- **None:**

HAL_SYSCFG_SetTCMRWMarginInput

Function name

void HAL_SYSCFG_SetTCMRWMarginInput (uint32_t TcmRwMarginInput)

Function description

Set external RW margin inputs for TCM memories.

Parameters

- **TcmRwMarginInput:** Input Margin.

Return values

- **None:**

HAL_SYSCFG_GetTCMRWMarginInput

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetTCMRWMarginInput (uint32_t * pTcmRwMarginInput)

Function description

Get the External RW margin inputs for TCM memories.

Parameters

- **pTcmRwMarginInput:** pointer to return Input Margin.

Return values

- **HAL:** status.

HAL_SYSCFG_SetTCMBiasingLevel

Function name

void HAL_SYSCFG_SetTCMBiasingLevel (uint32_t Level)

Function description

Set the TCM biasing level adjust input.

Parameters

- **Level:** Biaising level adjust input This parameter can one of the following values:
  - SYSCFG_TCM_BIAS_VNOM : Biasing level adjust input recommended for Vnom
  - SYSCFG_TCM_BIAS_VNOM_10_PERCENT : Biasing level adjust input recommended for Vnom + 10%

Return values

- **None:**

HAL_SYSCFG_GetTCMBiasingLevel

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetTCMBiasingLevel (uint32_t * pLevel)

Function description

Get the TCM biasing level adjust input.

Parameters

- **pLevel:** Pointer to return biasing level adjust input. The return value can be one of the following values:
  - SYSCFG_CACHE_BIAS_VNOM boot 0 pin: Biasing level adjust input recommended for Vnom
  - SYSCFG_CACHE_BIAS_VNOM_10_PERCENT: Biasing level adjust input recommended for Vnom + 10%

Return values

- **HAL:** status

HAL_SYSCFG_EnableCacheExternalMargin

Function name

void HAL_SYSCFG_EnableCacheExternalMargin (void)

Function description

Enable external RW margin inputs for Cache memories.

Return values

- **None:**

HAL_SYSCFG_DisableCacheExternalMargin

Function name

void HAL_SYSCFG_DisableCacheExternalMargin (void)

Function description

Disable external RW margin inputs for Cache memories.

Return values

- **None:**

HAL_SYSCFG_SetCacheRWMarginInput

Function name

void HAL_SYSCFG_SetCacheRWMarginInput (uint32_t CacheRWMarginInput)

Function description

Set External RW margin inputs for Cache memories.

Parameters

- **CacheRWMarginInput:** Input Margin.

Return values

- **None:**

HAL_SYSCFG_GetCacheRWMarginInput

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetCacheRWMarginInput (uint32_t * pCacheRWMarginInput)

Function description

Get the External RW margin inputs for Cache memories.

Parameters

- **pCacheRWMarginInput:** Pointer to return Input Margin.

Return values

- **HAL:** status

HAL_SYSCFG_SetCacheBiasingLevel

Function name

void HAL_SYSCFG_SetCacheBiasingLevel (uint32_t Level)

Function description

Set the Cache biasing level adjust input.

Parameters

- **Level:** the biaising level adjust input This parameter can one of the following values:
  - SYSCFG_CACHE_BIAS_VNOM: Biasing level adjust input recommended for Vnom
  - SYSCFG_CACHE_BIAS_VNOM_10_PERCENT: Biasing level adjust input recommended for Vnom + 10%

Return values

- **None:**

HAL_SYSCFG_GetCacheBiasingLevel

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetCacheBiasingLevel (uint32_t * pLevel)

Function description

Get the Cache biasing level adjust input.

Parameters

- **pLevel:** Pointer to return Cache biasing level adjust input. The return value can be onr of the following values:
  - SYSCFG_CACHE_BIAS_VNOM boot: Biasing level adjust input recommended for Vnom
  - SYSCFG_CACHE_BIAS_VNOM_10_PERCENT: Biasing level adjust input recommended for Vnom + 10%

Return values

- **HAL:** status

HAL_SYSCFG_SetSVTORAddress

Function name

void HAL_SYSCFG_SetSVTORAddress (uint32_t Address)

Function description

Set the secure vector table (VTOR) address.

Parameters

- **Address:** Secure VTOR address

Return values

- **None:**

Notes

- Secure vector table address must be set to ensure return from STANDBY state.

HAL_SYSCFG_GetSVTORAddress

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetSVTORAddress (uint32_t * pAddress)

Function description

Get the secure vector table (VTOR) address.

Parameters

- **pAddress:** Pointer to return the secure vector table address

Return values

- **HAL:** status

HAL_SYSCFG_SetNSVTORAddress

Function name

void HAL_SYSCFG_SetNSVTORAddress (uint32_t Address)

Function description

Set the non secure vector table (VTOR) address.

Parameters

- **Address:** Non-secure VTOR address

Return values

- **None:**

HAL_SYSCFG_GetNSVTORAddress

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetNSVTORAddress (uint32_t * pAddress)

Function description

Get the non secure VTOR address.

Parameters

- **pAddress:** Pointer to return the non-secure vector table address

Return values

- **HAL:** status

HAL_SYSCFG_EnablePowerOnReset

Function name

void HAL_SYSCFG_EnablePowerOnReset (void)

Function description

Enable the Power-on reset.

Return values

- **None:**

Notes

- Select power-on reset to apply on core upon SYSRESETREQ (NVIC_SystemReset())

HAL_SYSCFG_DisablePowerOnReset

Function name

void HAL_SYSCFG_DisablePowerOnReset (void)

Function description

Disable the Power-on reset.

Return values

- **None:**

Notes

- Select warm reset to apply on core upon SYSRESETREQ (NVIC_SystemReset())

HAL_SYSCFG_EnableLockupWarmResetonRCC

Function name

void HAL_SYSCFG_EnableLockupWarmResetonRCC (void)

Function description

Enable Lockup requests a warm reset to the RCC.

Return values

- **None:**

Notes

- Select action to perform on a lockup state on the core

HAL_SYSCFG_DisableLockupWarmResetonRCC

Function name

void HAL_SYSCFG_DisableLockupWarmResetonRCC (void)

Function description

Disable Lockup requests a warm reset to the RCC.

Return values

- **None:**

Notes

- Select action to perform on a lockup state on the core

HAL_SYSCFG_EnableLockupGenerateNMI

Function name

void HAL_SYSCFG_EnableLockupGenerateNMI (void)

Function description

Enable Lockup generates a NMI on the core.

Return values

- **None:**

Notes

- Select action to perform on a lockup state on the core

HAL_SYSCFG_DisableLockupGenerateNMI

Function name

void HAL_SYSCFG_DisableLockupGenerateNMI (void)

Function description

Disable Lockup generates a NMI on the core.

Return values

- **None:**

Notes

- Select action to perform on a lockup state on the core

HAL_SYSCFG_ReEnableWritePostingErrorCapture

Function name

HAL_StatusTypeDef HAL_SYSCFG_ReEnableWritePostingErrorCapture (void)

Function description

Enable the capture mechanism upon write posting buffer error.

Return values

- **HAL:** status.

Notes

- Upon error detection, the erroneous address is logged on and the capture mechanism is on hold. The address error can be read thanks to HAL_SYSCFG_GetAddressWritePostingBuffer.
- This function enables the error capture mechanism again.

HAL_SYSCFG_EnableVENCRAMReserved

Function name

void HAL_SYSCFG_EnableVENCRAMReserved (void)

Function description

Reserve the VENCRAM allocation to VENC.

Return values

- **None:**

HAL_SYSCFG_DisableVENCRAMReserved

Function name

void HAL_SYSCFG_DisableVENCRAMReserved (void)

Function description

Release the VENCRAM allocation to VENC (any use allowed).

Return values

- **None:**

HAL_SYSCFG_EnableCRYPPotentialTamper

Function name

void HAL_SYSCFG_EnableCRYPPotentialTamper (void)

Function description

Enable PKA, SAES, CRYP1/2, and HASH reset, in case of potential tamper.

Return values

- **None:**

HAL_SYSCFG_DisableCRYPPotentialTamper

Function name

void HAL_SYSCFG_DisableCRYPPotentialTamper (void)

Function description

Disable PKA, SAES, CRYP1/2, and HASH reset, in case of potential tamper.

Return values

- **None:**

HAL_SYSCFG_SetWriteQosNP1

Function name

void HAL_SYSCFG_SetWriteQosNP1 (uint32_t QosValue)

Function description

Set write QoS information for master port from NP1 NPUNIC.

Parameters

- **QosValue:** Write QoS value (0 to 15).

Return values

- **None:**

HAL_SYSCFG_GetWriteQosNP1

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetWriteQosNP1 (uint32_t * pQosValue)

Function description

Get write QoS information for master port from NP1 NPUNIC.

Parameters

- **pQosValue:** Pointer to return write QOS value (0 to 15)

Return values

- **HAL:** status

HAL_SYSCFG_SetReadQosNP1

Function name

void HAL_SYSCFG_SetReadQosNP1 (uint32_t QosValue)

Function description

Set read QoS information for master port from NP1 NPUNIC.

Parameters

- **QosValue:** Read QoS value (0 to 15)

Return values

- **None:**

HAL_SYSCFG_GetReadQosNP1

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetReadQosNP1 (uint32_t * pQosValue)

Function description

Get read QoS information for master port from NP1 NPUNIC.

Parameters

- **pQosValue:** Pointer to return read QOS value (0 to 15)

Return values

- **HAL:** status

HAL_SYSCFG_SetWriteQosNP2

Function name

void HAL_SYSCFG_SetWriteQosNP2 (uint32_t QosValue)

Function description

Set write QoS information for master port from NP2 NPUNIC.

Parameters

- **QosValue:** Write Qos value (0 to 15)

Return values

- **None:**

HAL_SYSCFG_GetWriteQosNP2

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetWriteQosNP2 (uint32_t * pQosValue)

Function description

Get write QoS information for master port from NP2 NPUNIC.

Parameters

- **pQosValue:** Pointer to return write QOS value (0 to 15)

Return values

- **HAL:** status

HAL_SYSCFG_SetReadQosNP2

Function name

void HAL_SYSCFG_SetReadQosNP2 (uint32_t QosValue)

Function description

Set read QoS information for master port from NP2 NPUNIC.

Parameters

- **QosValue:** Read Qos value (0 to 15)

Return values

- **None:**

HAL_SYSCFG_GetReadQosNP2

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetReadQosNP2 (uint32_t * pQosValue)

Function description

Get read QoS information for master port from NP2 NPUNIC.

Parameters

- **pQosValue:** Pointer to return read QOS value (0 to 15)

Return values

- **HAL:** status

HAL_SYSCFG_SetWriteQosCPUSS

Function name

void HAL_SYSCFG_SetWriteQosCPUSS (uint32_t QosValue)

Function description

Set write QoS information for master port from CPUSS NPUNIC.

Parameters

- **QosValue:** Write QoS value (0 to 15)

Return values

- **None:**

HAL_SYSCFG_GetwriteQosCPUSS

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetwriteQosCPUSS (uint32_t * pQosValue)

Function description

Get write QoS information for master port from CPUSS NPUNIC.

Parameters

- **pQosValue:** Pointer to return write QOS value (0 to 15)

Return values

- **HAL:** status

HAL_SYSCFG_SetReadQosCPUSS

Function name

void HAL_SYSCFG_SetReadQosCPUSS (uint32_t QosValue)

Function description

Set read QoS information for master port from CPUSS NPUNIC.

Parameters

- **QosValue:** Read QoS value (0 to 15)

Return values

- **None:**

HAL_SYSCFG_GetReadQosCPUSS

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetReadQosCPUSS (uint32_t * pQosValue)

Function description

Get read QoS information for master port from CPUSS NPUNIC.

Parameters

- **pQosValue:** Pointer to return read QOS value (0 to 15)

Return values

- **HAL:** status

HAL_SYSCFG_EnableSDMMCEarlyWRRESP

Function name

void HAL_SYSCFG_EnableSDMMCEarlyWRRESP (uint32_t Sdmmc)

Function description

Enable SDMMC early-write response.

Parameters

- **Sdmmc:** Selected SDMMC instance(s). This parameter can be a one of SDMMC Id

Return values

- **None:**

HAL_SYSCFG_DisableSDMMCEarlyWRRSP

Function name

void HAL_SYSCFG_DisableSDMMCEarlyWRRSP (uint32_t Sdmmc)

Function description

Disable SDMMC early-write response.

Parameters

- **Sdmmc:** Selected SDMMC instance(s). This parameter can be a one of SDMMC Id

Return values

- **None:**

HAL_SYSCFG_EnableUSBEarlyEarlyWRRESP

Function name

void HAL_SYSCFG_EnableUSBEarlyEarlyWRRESP (uint32_t Usb)

Function description

Enable USB early-write response.

Parameters

- **Usb:** Selected USB instance(s). This parameter can be a one of USB Id

Return values

- **None:**

HAL_SYSCFG_DisableUSBEarlyEarlyWRRESP

Function name

void HAL_SYSCFG_DisableUSBEarlyEarlyWRRESP (uint32_t Usb)

Function description

Disable USB early-write response.

Parameters

- **Usb:** Selected USB instance(s). This parameter can be a one of USB Id

Return values

- **None:**

HAL_SYSCFG_EnablexPUClockGating

Function name

void HAL_SYSCFG_EnablexPUClockGating (uint32_t Xpu)

Function description

Enable xPU clock gating.

Parameters

- **Xpu:** Selected CPU(s). This parameter can be a one of XPU Id

Return values

- **None:**

HAL_SYSCFG_DisablexPUClockGating

Function name

void HAL_SYSCFG_DisablexPUClockGating (uint32_t Xpu)

Function description

Disable xPU clock gating.

Parameters

- **Xpu:** Selected CPU(s). This parameter can be a one of XPU Id

Return values

- **None:**

HAL_SYSCFG_EnableVDDIO2CompensationCell

Function name

void HAL_SYSCFG_EnableVDDIO2CompensationCell (void)

Function description

Enable the VDDIO2 compensation cell.

Return values

- **None:**

HAL_SYSCFG_DisableVDDIO2CompensationCell

Function name

void HAL_SYSCFG_DisableVDDIO2CompensationCell (void)

Function description

Disable the VDDIO2 compensation cell.

Return values

- **None:**

HAL_SYSCFG_EnableVDDIO3CompensationCell

Function name

void HAL_SYSCFG_EnableVDDIO3CompensationCell (void)

Function description

Enable the VDDIO3 compensation cell.

Return values

- **None:**

HAL_SYSCFG_DisableVDDIO3CompensationCell

Function name

void HAL_SYSCFG_DisableVDDIO3CompensationCell (void)

Function description

Disable the VDDIO3 compensation cell.

Return values

- **None:**

HAL_SYSCFG_EnableVDDIO4CompensationCell

Function name

void HAL_SYSCFG_EnableVDDIO4CompensationCell (void)

Function description

Enable the VDDIO4 compensation cell.

Return values

- **None:**

HAL_SYSCFG_DisableVDDIO4CompensationCell

Function name

void HAL_SYSCFG_DisableVDDIO4CompensationCell (void)

Function description

Disable the VDDIO4 compensation cell.

Return values

- **None:**

HAL_SYSCFG_EnableVDDIO5CompensationCell

Function name

void HAL_SYSCFG_EnableVDDIO5CompensationCell (void)

Function description

Enable the VDDIO5 compensation cell.

Return values

- **None:**

HAL_SYSCFG_DisableVDDIO5CompensationCell

Function name

void HAL_SYSCFG_DisableVDDIO5CompensationCell (void)

Function description

Disable the VDDIO5 compensation cell.

Return values

- **None:**

HAL_SYSCFG_ConfigVDDIOCompensationCell

Function name

HAL_StatusTypeDef HAL_SYSCFG_ConfigVDDIOCompensationCell (uint32_t Selection, uint32_t Code, uint32_t NmosValue, uint32_t PmosValue)

Function description

Configure the code selection for the compensation cell.

Parameters

- **Selection:** specifies the concerned compensation cell This parameter can one of the following values:
  - SYSCFG_IO_VDDIO2_CELL Compensation cell for the VDDIO2
  - SYSCFG_IO_VDDIO3_CELL Compensation cell for the VDDIO3
  - SYSCFG_IO_VDDIO4_CELL Compensation cell for the VDDIO4
  - SYSCFG_IO_VDDIO5_CELL Compensation cell for the VDDIO5
- **Code:** code selection to be applied for the I/O compensation cell This parameter can be one of the following values:
  - SYSCFG_IO_CELL_CODE Code from the cell (available in the SYSCFG_VDDIOxCCSR)
  - SYSCFG_IO_REGISTER_CODE Code from the compensation cell code register ((SYSCFG_VDDIOxCCCR)
- **NmosValue:** In case SYSCFG_IO_REGISTER_CODE is selected, it provides the Nmos value to apply in range 0 to 15 else this parameter is not used
- **PmosValue:** In case SYSCFG_IO_REGISTER_CODE is selected, it provides the Pmos value to apply in range 0 to 15 else this parameter is not used

Return values

- **HAL:** status

HAL_SYSCFG_GetVDDIOCompensationCell

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetVDDIOCompensationCell (uint32_t Selection, const uint32_t * pCode, uint32_t * pNmosValue, uint32_t * pPmosValue)

Function description

Get the code selection for the compensation cell.

Parameters

- **Selection:** specifies the concerned compensation cell This parameter can one of the following values:
  - SYSCFG_IO_VDDIO2_CELL Compensation cell for the VDDIO2
  - SYSCFG_IO_VDDIO3_CELL Compensation cell for the VDDIO3
  - SYSCFG_IO_VDDIO4_CELL Compensation cell for the VDDIO4
  - SYSCFG_IO_VDDIO5_CELL Compensation cell for the VDDIO5
- **pCode:** pointer to code selection This parameter can be one of the following values:
  - SYSCFG_IO_CELL_CODE Code from the cell (available in the SYSCFG_VDDIOxCCSR)
  - SYSCFG_IO_REGISTER_CODE Code from the compensation cell code register ((SYSCFG_VDDIOxCCCR)
- **pNmosValue:** pointer to the Nmos value in range 0 to 15
- **pPmosValue:** pointer to the Pmos value in range 0 to 15

Return values

- **HAL_OK:** (all values available) or HAL_ERROR (check parameters)

HAL_SYSCFG_GetCompVDDIO2CellReadyStatus

Function name

uint32_t HAL_SYSCFG_GetCompVDDIO2CellReadyStatus (void)

Function description

Get the compensation cell ready status of VDDIO2.

Return values

- **Ready:** status (0 (not ready) or !=0 (ready))

HAL_SYSCFG_GetCompVDDIO3CellReadyStatus

Function name

uint32_t HAL_SYSCFG_GetCompVDDIO3CellReadyStatus (void)

Function description

Get the compensation cell ready status of VDDIO3.

Return values

- **Ready:** status (0 (not ready) or !=0 (ready))

HAL_SYSCFG_GetCompVDDIO4CellReadyStatus

Function name

uint32_t HAL_SYSCFG_GetCompVDDIO4CellReadyStatus (void)

Function description

Get the compensation cell ready status of VDDIO4.

Return values

- **Ready:** status (0 (not ready) or !=0 (ready))

HAL_SYSCFG_GetCompVDDIO5CellReadyStatus

Function name

uint32_t HAL_SYSCFG_GetCompVDDIO5CellReadyStatus (void)

Function description

Get the compensation cell ready status of VDDIO5.

Return values

- **Ready:** status (0 (not ready) or !=0 (ready))

HAL_SYSCFG_ConfigVDDCompensationCell

Function name

HAL_StatusTypeDef HAL_SYSCFG_ConfigVDDCompensationCell (uint32_t Code, uint32_t NmosValue, uint32_t PmosValue)

Function description

Configure the code selection for the compensation cell of VDD.

Parameters

- **Code:** code selection to be applied for the I/O compensation cell This parameter can be one of the following values:
  - SYSCFG_IO_CELL_CODE Code from the cell (available in the SYSCFG_VDDIOxCCSR)
  - SYSCFG_IO_REGISTER_CODE Code from the compensation cell code register ((SYSCFG_VDDIOxCCCR)
- **NmosValue:** In case SYSCFG_IO_REGISTER_CODE is selected, it provides the Nmos value to apply in range 0 to 15 else this parameter is not used
- **PmosValue:** In case SYSCFG_IO_REGISTER_CODE is selected, it provides the Pmos value to apply in range 0 to 15 else this parameter is not used

Return values

- **HAL:** status

HAL_SYSCFG_EnableVDDCompensationCell

Function name

void HAL_SYSCFG_EnableVDDCompensationCell (void)

Function description

Enable the VDD compensation cell.

Return values

- **None:**

HAL_SYSCFG_DisableVDDCompensationCell

Function name

void HAL_SYSCFG_DisableVDDCompensationCell (void)

Function description

Disable the VDD compensation cell.

Return values

- **None:**

HAL_SYSCFG_GetVDDCompensationCell

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetVDDCompensationCell (uint32_t Code, uint32_t * pNmosValue, uint32_t * pPmosValue)

Function description

Get the code selection for the compensation cell of VDD.

Parameters

- **Code:** code selection This parameter can be one of the following values:
  - SYSCFG_IO_CELL_CODE Code from the cell (available in the SYSCFG_VDDIOxCCSR)
  - SYSCFG_IO_REGISTER_CODE Code from the compensation cell code register ((SYSCFG_VDDIOxCCCR)
- **pNmosValue:** pointer to the Nmos value in range 0 to 15
- **pPmosValue:** pointer to the Pmos value in range 0 to 15

Return values

- **HAL_OK:** (all values available) or HAL_ERROR (check parameters)

HAL_SYSCFG_GetCompensationVDDCellReadyStatus

Function name

uint32_t HAL_SYSCFG_GetCompensationVDDCellReadyStatus (void)

Function description

Get the compensation cell ready status of VDD.

Return values

- **Ready:** status (0 (not ready) or !=0 (ready))

HAL_SYSCFG_ConfigTimerBreakInput

Function name

void HAL_SYSCFG_ConfigTimerBreakInput (uint32_t Input)

Function description

Configure the Timer Break input for error flag(s).

Parameters

- **Input:** Input configuration This parameter can be one or a combination of the following values:
  - SYSCFG_CBR_BREAK_LOCK_CORE Cortex-CM55 lockup
  - SYSCFG_CBR_BREAK_LOCK_PVD PVD lock
  - SYSCFG_CBR_BREAK_LOCK_BKPRAM Backup SRAM ECC error
  - SYSCFG_CBR_BREAK_LOCK_CM55_CACHE CM55 cache double ECC error
  - SYSCFG_CBR_BREAK_LOCK_CM55_TCM DTCM double ECC error

Return values

- **None:**

Notes

- When a configuration is set, only a system reset can reset it.

HAL_SYSCFG_GetTimerBreakInputConfig

Function name

uint32_t HAL_SYSCFG_GetTimerBreakInputConfig (void)

Function description

Get the Timer Break input configuration.

Return values

- **Timer:** break input configuration This return value can be one or a combination of the following values:
  - SYSCFG_CBR_BREAK_LOCK_CORE Cortex-CM55 lockup
  - SYSCFG_CBR_BREAK_LOCK_PVD PVD lock
  - SYSCFG_CBR_BREAK_LOCK_BKPRAM Backup SRAM ECC error
  - SYSCFG_CBR_BREAK_LOCK_CM55_CACHE CM55 cache double ECC error
  - SYSCFG_CBR_BREAK_LOCK_CM55_TCM DTCM double ECC error

Notes

- When a configuration is set, only a system reset can reset it.

HAL_SYSCFG_SetPerceivedCID

Function name

void HAL_SYSCFG_SetPerceivedCID (uint32_t Cid)

Function description

Set the perceived CID of the peripheral.

Parameters

- **Cid:** CID in range 0 to 7

Return values

- **None:**

Notes

- Set the perceived CID so that all accesses which arrive at the peripheral (here HPDMA) appear to carry that CID. See Multi-tenancy section of the reference manual for further information.

HAL_SYSCFG_GetPerceivedCID

Function name

uint32_t HAL_SYSCFG_GetPerceivedCID (void)

Function description

Get the perceived CID of the peripheral.

Return values

- **CID:** in range 0 to 7

HAL_SYSCFG_SetPerceivedPrivCID

Function name

void HAL_SYSCFG_SetPerceivedPrivCID (uint32_t Cid)

Function description

Set the perceived CID of the peripheral as privileged.

Parameters

- **Cid:** in range 0 to 7

Return values

- **None:**

Notes

- Set the perceived CID so that all accesses which arrive at the peripheral (here HPDMA) appear to carry that CID. This function shall be called in case of DMA channel interrupt (privileged) code to read the registers and clear the interrupt of this DMA channel. See Multi-tenancy section of the reference manual for forther information.

HAL_SYSCFG_GetPerceivedPrivCID

Function name

uint32_t HAL_SYSCFG_GetPerceivedPrivCID (void)

Function description

Get the perceived CID of the peripheral as privileged.

Return values

- **CID:** in range 0 to 7

HAL_SYSCFG_EnableReTimingRXpath

Function name

void HAL_SYSCFG_EnableReTimingRXpath (void)

Function description

Enable Retiming on RX path.

Return values

- **None:**

HAL_SYSCFG_DisableReTimingRXpath

Function name

void HAL_SYSCFG_DisableReTimingRXpath (void)

Function description

Disable Retiming on RX path.

Return values

- **None:**

HAL_SYSCFG_EnableReTimingTXpath

Function name

void HAL_SYSCFG_EnableReTimingTXpath (void)

Function description

Enable Retiming on TX path.

Return values

- **None:**

HAL_SYSCFG_DisableReTimingTXpath

Function name

void HAL_SYSCFG_DisableReTimingTXpath (void)

Function description

Disable Retiming on TX path.

Return values

- **None:**

HAL_SYSCFG_SetDelayOnFeedbackClock

Function name

void HAL_SYSCFG_SetDelayOnFeedbackClock (uint32_t Delay)

Function description

Set delay on feedback clock.

Parameters

- **Delay:** Delay on feedback clock
  - SYSCFG_DELAY_FEEDBACK_NONE None
  - SYSCFG_DELAY_FEEDBACK_HALF_CYCLE Half a cycle delay

Return values

- **None:**

HAL_SYSCFG_GetDelayOnFeedbackClock

Function name

uint32_t HAL_SYSCFG_GetDelayOnFeedbackClock (void)

Function description

Get delay on feedback clock.

Return values

- **Delay:** on feedback clock
  - SYSCFG_DELAY_FEEDBACK_NONE None
  - SYSCFG_DELAY_FEEDBACK_HALF_CYCLE Half a cycle delay

HAL_SYSCFG_EnableInterleavingCpuRam

Function name

void HAL_SYSCFG_EnableInterleavingCpuRam (void)

Function description

Enable the interleaving on NPU RAM.

Return values

- **None:**

HAL_SYSCFG_DisableInterleavingCpuRam

Function name

void HAL_SYSCFG_DisableInterleavingCpuRam (void)

Function description

Disable the interleaving on NPU RAM.

Return values

- **None:**

HAL_SYSCFG_GetBootPinConnection

Function name

uint32_t HAL_SYSCFG_GetBootPinConnection (uint32_t BootId)

Function description

Get BOOT pin connection status.

Parameters

- **BootId:** specifies the boot pins.

Return values

- **BOOT:** pin connection configuration This return value can be one of the following values:
  - SYSCFG_BOOT_CONNECTION_VSS pin connected to VSS
  - SYSCFG_BOOT_CONNECTION_VDD pin connected to VDD

HAL_SYSCFG_GetAddressWritePostingBuffer

Function name

uint32_t HAL_SYSCFG_GetAddressWritePostingBuffer (void)

Function description

Get address of first error in P-AHB write-posting buffer.

Return values

- **Address:** of the first error in P-AHB write-posting buffer

HAL FDCAN Error Code

HAL_FDCAN_ERROR_NONE

No error

HAL_FDCAN_ERROR_TIMEOUT

Timeout error

HAL_FDCAN_ERROR_NOT_INITIALIZED

Peripheral not initialized

HAL_FDCAN_ERROR_NOT_READY

Peripheral not ready

HAL_FDCAN_ERROR_NOT_STARTED

Peripheral not started

HAL_FDCAN_ERROR_NOT_SUPPORTED

Mode not supported

HAL_FDCAN_ERROR_PARAM

Parameter error

HAL_FDCAN_ERROR_PENDING

Pending operation

HAL_FDCAN_ERROR_RAM_ACCESS

Message RAM Access Failure

HAL_FDCAN_ERROR_FIFO_EMPTY

Put element in full FIFO

HAL_FDCAN_ERROR_FIFO_FULL

Get element from empty FIFO

HAL_FDCAN_ERROR_LOG_OVERFLOW

Overflow of CAN Error Logging Counter

HAL_FDCAN_ERROR_RAM_WDG

Message RAM Watchdog event occurred

HAL_FDCAN_ERROR_PROTOCOL_ARBT

Protocol Error in Arbitration Phase (Nominal Bit Time is used)

HAL_FDCAN_ERROR_PROTOCOL_DATA

Protocol Error in Data Phase (Data Bit Time is used)

HAL_FDCAN_ERROR_RESERVED_AREA

Access to Reserved Address

HAL_FDCAN_ERROR_TT_GLOBAL_TIME

Global Time Error : Synchronization deviation exceeded limit

HAL_FDCAN_ERROR_TT_TX_UNDERFLOW

Tx Count Underflow : Less Tx trigger than expected in one matrix cycle

HAL_FDCAN_ERROR_TT_TX_OVERFLOW

Tx Count Overflow : More Tx trigger than expected in one matrix cycle

HAL_FDCAN_ERROR_TT_SCHEDULE1

Scheduling error 1

HAL_FDCAN_ERROR_TT_SCHEDULE2

Scheduling error 2

HAL_FDCAN_ERROR_TT_NO_INIT_REF

No system startup due to missing reference message

HAL_FDCAN_ERROR_TT_NO_REF

Missing reference message

HAL_FDCAN_ERROR_TT_APPL_WDG

Application watchdog not served in time

HAL_FDCAN_ERROR_TT_CONFIG

Error found in trigger list

HAL_FDCAN_ERROR_INVALID_CALLBACK

Invalid Callback error

I3C Notification ID definition

EVENT_ID_GETACCCR

I3C target complete controller-role hand-off (direct GETACCR CCC) event

EVENT_ID_IBIEND

I3C target IBI end process event

EVENT_ID_DAU

I3C target receive a dynamic address update (ENTDAA/RSTDAA/SETNEWDA CCC) event

EVENT_ID_GETx

I3C target receive any direct GETxxx CCC event

EVENT_ID_GETSTATUS

I3C target receive get status command (direct GETSTATUS CCC) event

EVENT_ID_SETMWL

I3C target receive maximum write length update (direct SETMWL CCC) event

EVENT_ID_SETMRL

I3C target receive maximum read length update(direct SETMRL CCC) event

EVENT_ID_RSTACT

I3C target detect reset pattern (broadcast or direct RSTACT CCC) event

EVENT_ID_ENTASx

I3C target receive activity state update (direct or broadcast ENTASx) event

EVENT_ID_ENEC_DISEC

I3C target receive a direct or broadcast ENEC/DISEC CCC event

EVENT_ID_DEFTGTS

I3C target receive a broadcast DEFTGTS CCC event

EVENT_ID_DEFGRPA

I3C target receive a group addressing (broadcast DEFGRPA CCC) event

EVENT_ID_WKP

I3C target wakeup event

EVENT_ID_IBI

I3C controller receive IBI event

EVENT_ID_CR

I3C controller controller-role request event

EVENT_ID_HJ

I3C controller hot-join event

HAL state definition

HAL_SMBUS_STATE_RESET

SMBUS not yet initialized or disabled

HAL_SMBUS_STATE_READY

SMBUS initialized and ready for use

HAL_SMBUS_STATE_BUSY

SMBUS internal process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_TX

Master Data Transmission process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_RX

Master Data Reception process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_TX

Slave Data Transmission process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_RX

Slave Data Reception process is ongoing

HAL_SMBUS_STATE_LISTEN

Address Listen Mode is ongoing

Boot Id

Boot 0 selection

SYSCFG_BOOT_1

Boot 1 selection

Cache biasing level adjust input selection

SYSCFG_CACHE_BIAS_VNOM

SYSCFG_CACHE_BIAS_VNOM_10_PERCENT

Compensation Cell Selection

SYSCFG_IO_VDDIO2_CELL

I/O Compensation cell for VDDIO2

SYSCFG_IO_VDDIO3_CELL

I/O Compensation cell for VDDIO3

SYSCFG_IO_VDDIO4_CELL

I/O Compensation cell for VDDIO4

SYSCFG_IO_VDDIO5_CELL

I/O Compensation cell for VDDIO5

Delay on feedback clock

SYSCFG_DELAY_FEEDBACK_NONE

No delay on the feedback clock

SYSCFG_DELAY_FEEDBACK_HALF_CYCLE

Half a cycle delay on the feedback clock

SYSCFG DTCM size

SYSCFG_DTCM_128K

DTCM memory size is 128K

SYSCFG_DTCM_256K

DTCM memory size is 256K

SYSCFG Exported Macros

__HAL_SYSCFG_FPU_INTERRUPT_ENABLE

Description:

- Floating Point Unit interrupt enable/disable macros.

Parameters:

- __INTERRUPT__: This parameter can be a value of

__HAL_SYSCFG_FPU_INTERRUPT_DISABLE

FPU Interrupts

SYSCFG_IT_FPU_IOC

Floating Point Unit Invalid operation Interrupt

SYSCFG_IT_FPU_DZC

Floating Point Unit Divide-by-zero Interrupt

SYSCFG_IT_FPU_UFC

Floating Point Unit Underflow Interrupt

SYSCFG_IT_FPU_OFC

Floating Point Unit Overflow Interrupt

SYSCFG_IT_FPU_IDC

Floating Point Unit Input denormal Interrupt

SYSCFG_IT_FPU_IXC

Floating Point Unit Inexact Interrupt

SYSCFG_IT_FPU_ALL

IO Compensation Code config

SYSCFG_IO_CELL_CODE

Code from the cell

SYSCFG_IO_REGISTER_CODE

Code from the values in the cell code register

SYSCFG ITCM size

SYSCFG_ITCM_64K

ITCM memory size is 64K

SYSCFG_ITCM_128K

ITCM memory size is 128K

SYSCFG_ITCM_256K

ITCM memory size is 256K

SYSCFG Lock items

SYSCFG_MPU_NSEC

Non-secure MPU lock (privileged secure or non-secure only)

SYSCFG_VTOR_NSEC

Non-secure VTOR lock (privileged secure or non-secure only)

SYSCFG_DCAIC

Disable access to the instruction cache direct cache access registers DCAICLR and DCAICRR

SYSCFG_SAU

SAU lock (privileged secure code only)

SYSCFG_MPU_SEC

Secure MPU lock (privileged secure code only)

SYSCFG_VTOR_AIRCR_SEC

VTOR_S and AIRCR lock (privileged secure code only)

SYSCFG_LOCK_ALL

All

SDMMC Id

SYSCFG_SDMMC1

SYSCFG_USB1

USB 1 selection

SYSCFG_USB2

USB 2 selection

SYSCFG_USB_ALL

USB 1 & 2 selection

WRITE access selection

SYSCFG_LOCK_WR_TCM

ITCM memory size is 64K

SYSCFG_LOCK_WR_ITGU

Disable writes to registers associated with the ITCM interface security/gating.

SYSCFG_LOCK_WR_DTGU

Disable writes to registers associated with the DTCM interface security/gating

SYSCFG_LOCK_WR_ALL

All writes accesses

XPU Id

SYSCFG_NPU_NIC

NPU_NIC clock gating disable selection

SYSCFG_CPU_NIC

CPU_NIC clock gating disable selection

SYSCFG_CPU_NOC

CPU_NOC clock gating disable selection

SYSCFG_CPU_ALL

7 HAL ADC Generic Driver

7.1 ADC Firmware driver registers structures

7.1.1 ADC_OversamplingTypeDef

ADC_OversamplingTypeDef is defined in the stm32n6xx_hal_adc.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***
- ***uint32_t TriggeredMode***
- ***uint32_t OversamplingStopReset***

Field Documentation

- ***uint32_t ADC_OversamplingTypeDef::Ratio***
  Configures the oversampling ratio. This parameter can be a value from 1 to 1024
- ***uint32_t ADC_OversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***
- ***uint32_t ADC_OversamplingTypeDef::TriggeredMode***
  Selects the regular triggered oversampling mode. This parameter can be a value of ***ADC_HAL_EC_OVS_DISCONT_MODE***
- ***uint32_t ADC_OversamplingTypeDef::OversamplingStopReset***
  Selects the regular oversampling mode. The oversampling is either temporary stopped or reset upon an injected sequence interruption. If oversampling is enabled on both regular and injected groups, this parameter is discarded and forced to setting "ADC_REGOVERSAMPLING_RESUMED_MODE" (the oversampling buffer is zeroed during injection sequence). This parameter can be a value of ***ADC_HAL_EC_OVS_SCOPE_REG***

7.1.2 ADC_InitTypeDef

ADC_InitTypeDef is defined in the stm32n6xx_hal_adc.h

Data Fields

- ***uint32_t Resolution***
- ***uint32_t GainCompensation***
- ***uint32_t ScanConvMode***
- ***uint32_t EOCSelection***
- ***FunctionalState LowPowerAutoWait***
- ***FunctionalState ContinuousConvMode***
- ***uint32_t NbrOfConversion***
- ***FunctionalState DiscontinuousConvMode***
- ***uint32_t NbrOfDiscConversion***
- ***uint32_t ExternalTrigConv***
- ***uint32_t ExternalTrigConvEdge***
- ***uint32_t SamplingMode***
- ***uint32_t ConversionDataManagement***
- ***uint32_t Overrun***
- ***uint32_t LeftBitShift***
- ***FunctionalState OversamplingMode***
- ***ADC_OversamplingTypeDef Oversampling***

Field Documentation

- ***uint32_t ADC_InitTypeDef::Resolution***
  Configure the ADC resolution. This parameter can be a value of ***ADC_HAL_EC_RESOLUTION***

- ***uint32_t ADC_InitTypeDef::GainCompensation***
  Specify the ADC gain compensation coefficient to be applied to ADC raw conversion data, based on following formula: DATA = DATA(raw) * (gain compensation coef) / 4096 12 bit format, unsigned: 2 bits exponents / 12 bits mantissa Gain step is 1/4096 = 0.000244 Gain range is 0.0000 to 3.999756 This parameter value can be:
  - value "0": Gain compensation will be disabled and coefficient set to 0
  - value in range [0x0001; 0x3FFF]: Gain compensation will enabled and coefficient set to specified value
- ***uint32_t ADC_InitTypeDef::ScanConvMode***
  Configure the sequencer of ADC groups regular and injected. This parameter can be associated to parameter 'DiscontinuousConvMode' to have main sequence subdivided in successive parts. If disabled: Conversion is performed in single mode (one channel converted, the one defined in rank 1). Parameters 'NbrOfConversion' and 'InjectedNbrOfConversion' are discarded (equivalent to set to 1). If enabled: Conversions are performed in sequence mode (multiple ranks defined by 'NbrOfConversion' or 'InjectedNbrOfConversion' and rank of each channel in sequencer). Scan direction is upward: from rank 1 to rank 'n'. This parameter can be a value of ***ADC_Scan_mode***
- ***uint32_t ADC_InitTypeDef::EOCSelection***
  Specify which EOC (End Of Conversion) flag is used for conversion by polling and interruption: end of unitary conversion or end of sequence conversions. This parameter can be a value of ***ADC_EOCSelection***.
- ***FunctionalState ADC_InitTypeDef::LowPowerAutoWait***
  Select the dynamic low power Auto Delay: new conversion start only when the previous conversion (for ADC group regular) or previous sequence (for ADC group injected) has been retrieved by user software, using function **HAL_ADC_GetValue()** or **HAL_ADCEx_InjectedGetValue()**. This feature automatically adapts the frequency of ADC conversions triggers to the speed of the system that reads the data. Moreover, this avoids risk of overrun for low frequency applications. This parameter can be set to ENABLE or DISABLE. Note: It is not recommended to use with interruption or DMA (**HAL_ADC_Start_IT()**, **HAL_ADC_Start_DMA()**) since these modes have to clear immediately the EOC flag (by CPU to free the IRQ pending event or by DMA). Auto wait will work but fort a very short time, discarding its intended benefit (except specific case of high load of CPU or DMA transfers which can justify usage of auto wait). Do use with polling: 1. Start conversion with **HAL_ADC_Start()**, 2. Later on, when ADC conversion data is needed: use **HAL_ADC_PollForConversion()** to ensure that conversion is completed and **HAL_ADC_GetValue()** to retrieve conversion result and trig another conversion start. (in case of usage of ADC group injected, use the equivalent functions HAL_ADCExInjected_Start(), **HAL_ADCEx_InjectedGetValue()**, ...).
- ***FunctionalState ADC_InitTypeDef::ContinuousConvMode***
  Specify whether the conversion is performed in single mode (one conversion) or continuous mode for ADC group regular, after the first ADC conversion start trigger occurred (software start or external trigger). This parameter can be set to ENABLE or DISABLE.
- ***uint32_t ADC_InitTypeDef::NbrOfConversion***
  Specify the number of ranks that will be converted within the regular group sequencer. To use the regular group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min_Data = 1 and Max_Data = 16. Note: This parameter must be modified when no conversion is on going on regular group (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_InitTypeDef::DiscontinuousConvMode***
  Specify whether the conversions sequence of ADC group regular is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. If continuous mode is enabled, this parameter setting is discarded. This parameter can be set to ENABLE or DISABLE.
- ***uint32_t ADC_InitTypeDef::NbrOfDiscConversion***
  Specifies the number of discontinuous conversions in which the main sequence of ADC group regular (parameter NbrOfConversion) will be subdivided. If parameter 'DiscontinuousConvMode' is disabled, this parameter is discarded. This parameter must be a number between Min_Data = 1 and Max_Data = 8.
- ***uint32_t ADC_InitTypeDef::ExternalTrigConv***
  Select the external event source used to trigger ADC group regular conversion start. If set to ADC_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_regular_external_trigger_source***. Caution: external trigger source is common to all ADC instances.

- ***uint32_t ADC_InitTypeDef::ExternalTrigConvEdge***
  Select the external event edge used to trigger ADC group regular conversion start. If trigger source is set to ADC_SOFTWARE_START, this parameter is discarded. This parameter can be a value of ***ADC_regular_external_trigger_edge***
- ***uint32_t ADC_InitTypeDef::SamplingMode***
  Select the sampling mode to be used for ADC group regular conversion. This parameter can be a value of ***ADC_regular_sampling_mode***
- ***uint32_t ADC_InitTypeDef::ConversionDataManagement***
  Specifies whether the Data conversion data is managed: using the DMA (oneshot or circular), or stored in the DR register or transferred to MDF register. Note: In continuous mode, DMA must be configured in circular mode. Otherwise an overrun will be triggered when DMA buffer maximum pointer is reached. This parameter can be a value of ***ADC_ConversionDataManagement***. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32_t ADC_InitTypeDef::Overrun***
  Select the behavior in case of overrun: data overwritten or preserved (default). This parameter applies to ADC group regular only. This parameter can be a value of ***ADC_HAL_EC_REG_OVR_DATA_BEHAVIOR***. Note: In case of overrun set to data preserved and usage with programming model with interruption (HAL_Start_IT()): ADC IRQ handler has to clear end of conversion flags, this induces the release of the preserved data. If needed, this data can be saved in function **HAL_ADC_ConvCpltCallback()**, placed in user program code (called before end of conversion flags clear). Note: Error reporting with respect to the conversion mode:
  - Usage with ADC conversion by polling for event or interruption: Error is reported only if overrun is set to data preserved. If overrun is set to data overwritten, user can willingly not read all the converted data, this is not considered as an erroneous case.
  - Usage with ADC conversion by DMA: Error is reported whatever overrun setting (DMA is expected to process all data from data register).
- ***uint32_t ADC_InitTypeDef::LeftBitShift***
  Configures the left shifting applied to the final result with or without oversampling. This parameter can be a value of ***ADCEx_Left_Bit_Shift***
- ***FunctionalState ADC_InitTypeDef::OversamplingMode***
  Specify whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing on ADC groups regular and injected
- ***ADC_OversamplingTypeDef ADC_InitTypeDef::Oversampling***
  Specify the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling is already enabled.

7.1.3 ADC_ChannelConfTypeDef

ADC_ChannelConfTypeDef is defined in the stm32n6xx_hal_adc.h

Data Fields

- ***uint32_t Channel***
- ***uint32_t Rank***
- ***uint32_t SamplingTime***
- ***uint32_t SingleDiff***
- ***uint32_t OffsetNumber***
- ***uint32_t Offset***
- ***FunctionalState OffsetSignedSaturation***
- ***FunctionalState OffsetSaturation***
- ***uint32_t OffsetSign***

Field Documentation

- ***uint32_t ADC_ChannelConfTypeDef::Channel***
  Specify the channel to configure into ADC regular group. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.

- ***uint32_t ADC_ChannelConfTypeDef::Rank***
  Specify the rank in the regular group sequencer. This parameter can be a value of ***ADC_HAL_EC_REG_SEQ_RANKS*** Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted)
- ***uint32_t ADC_ChannelConfTypeDef::SamplingTime***
  Sampling time value to be set for the selected channel. Unit: ADC clock cycles Conversion time is the addition of sampling time and processing time (13.5 ADC clock cycles at ADC resolution 12 bits, 11.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME*** Caution: This parameter applies to a channel that can be used into regular and/or injected group. It overwrites the last setting. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting). Refer to device datasheet for timings values.
- ***uint32_t ADC_ChannelConfTypeDef::SingleDiff***
  Select single-ended or differential input. In differential mode: Differential measurement is carried out between the selected channel (positive input) and another channel (negative input). Refer to reference manual for corresponding channel. Only channel of positive input has to be configured, the other channel is configured automatically. This parameter must be a value of ***ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING*** Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)
- ***uint32_t ADC_ChannelConfTypeDef::OffsetNumber***
  Select the offset number This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB*** Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.
- ***uint32_t ADC_ChannelConfTypeDef::Offset***
  Define the offset to be subtracted from the raw converted data. Offset value must be a positive number. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_ChannelConfTypeDef::OffsetSignedSaturation***
  Specify whether the Signed saturation feature is used or not. This parameter is applied only for 16-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE.
- ***FunctionalState ADC_ChannelConfTypeDef::OffsetSaturation***
  Define if the offset should be saturated upon under or over flow. This parameter value can be ENABLE or DISABLE. Note:
  - This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32_t ADC_ChannelConfTypeDef::OffsetSign***
  Define if the offset should be subtracted (negative sign) or added (positive sign) from or to the raw converted data. This parameter can be a value of ***ADCEx_OffsetSign***. Note:
  - This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).

7.1.4 ADC_AnalogWDGConfTypeDef

ADC_AnalogWDGConfTypeDef is defined in the stm32n6xx_hal_adc.h

Data Fields

- ***uint32_t WatchdogNumber***
- ***uint32_t WatchdogMode***
- ***uint32_t Channel***
- ***FunctionalState ITMode***

- ***uint32_t HighThreshold***
- ***uint32_t LowThreshold***
- ***uint32_t FilteringConfig***

Field Documentation

- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogNumber***
  Select which ADC analog watchdog is monitoring the selected channel. For Analog Watchdog 1: Only 1 channel can be monitored (or overall group of channels by setting parameter 'WatchdogMode') For Analog Watchdog 2 and 3: Several channels can be monitored (by successive calls of '**HAL_ADC_AnalogWDGConfig()**' for each channel) This parameter can be a value of ***ADC_HAL_EC_AWD_NUMBER***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogMode***
  Configure the ADC analog watchdog mode: single/all/none channels. For Analog Watchdog 1: Configure the ADC analog watchdog mode: single channel or all channels, ADC groups regular and-or injected. For Analog Watchdog 2 and 3: Several channels can be monitored by applying successively the AWD init structure. Channels on ADC group regular and injected are not differentiated: Set value 'ADC_ANALOGWATCHDOG_SINGLE_xxx' to monitor 1 channel, value 'ADC_ANALOGWATCHDOG_ALL_xxx' to monitor all channels, 'ADC_ANALOGWATCHDOG_NONE' to monitor no channel. This parameter can be a value of ***ADC_analog_watchdog_mode***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::Channel***
  Select which ADC channel to monitor by analog watchdog. For Analog Watchdog 1: this parameter has an effect only if parameter 'WatchdogMode' is configured on single channel (only 1 channel can be monitored). For Analog Watchdog 2 and 3: Several channels can be monitored. To use this feature, call successively the function **HAL_ADC_AnalogWDGConfig()** for each channel to be added (or removed with value 'ADC_ANALOGWATCHDOG_NONE'). This parameter can be a value of ***ADC_HAL_EC_CHANNEL***.
- ***FunctionalState ADC_AnalogWDGConfTypeDef::ITMode***
  Specify whether the analog watchdog is configured in interrupt or polling mode. This parameter can be set to ENABLE or DISABLE
- ***uint32_t ADC_AnalogWDGConfTypeDef::HighThreshold***
  Configure the ADC analog watchdog High threshold value. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively.
- ***uint32_t ADC_AnalogWDGConfTypeDef::LowThreshold***
  Configures the ADC analog watchdog Low threshold value. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively.
- ***uint32_t ADC_AnalogWDGConfTypeDef::FilteringConfig***
  Specify whether filtering should be use and the number of samples to consider. Before setting flag or raising interrupt, analog watchdog can wait to have several consecutive out-of-window samples. This parameter allows to configure this number. This parameter only applies to Analog watchdog 1. For others, use value ADC_AWD_FILTERING_NONE. This parameter can be a value of ***ADC_analog_watchdog_filtering_config***.

7.1.5 __ADC_HandleTypeDef

__ADC_HandleTypeDef is defined in the stm32n6xx_hal_adc.h

Data Fields

- ***ADC_TypeDef * Instance***
- ***ADC_InitTypeDef Init***
- ***DMA_HandleTypeDef * DMA_Handle***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t State***
- ***__IO uint32_t ErrorCode***
- ***void(* ConvCpltCallback***
- ***void(* ConvHalfCpltCallback***
- ***void(* LevelOutOfWindowCallback***
- ***void(* ErrorCallback***
- ***void(* InjectedConvCpltCallback***

- ***void(* LevelOutOfWindow2Callback***
- ***void(* LevelOutOfWindow3Callback***
- ***void(* EndOfSamplingCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***ADC_TypeDef* __ADC_HandleTypeDef::Instance***
  Register base address
- ***ADC_InitTypeDef __ADC_HandleTypeDef::Init***
  ADC initialization parameters and regular conversions setting
- ***DMA_HandleTypeDef* __ADC_HandleTypeDef::DMA_Handle***
  Pointer DMA Handler
- ***HAL_LockTypeDef __ADC_HandleTypeDef::Lock***
  ADC locking object
- ***__IO uint32_t __ADC_HandleTypeDef::State***
  ADC communication state (bitmap of ADC states)
- ***__IO uint32_t __ADC_HandleTypeDef::ErrorCode***
  ADC Error code
- ***void(* __ADC_HandleTypeDef::ConvCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC conversion complete callback
- ***void(* __ADC_HandleTypeDef::ConvHalfCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC conversion DMA half-transfer callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindowCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 1 callback
- ***void(* __ADC_HandleTypeDef::ErrorCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC error callback
- ***void(* __ADC_HandleTypeDef::InjectedConvCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC group injected conversion complete callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindow2Callback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 2 callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindow3Callback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 3 callback
- ***void(* __ADC_HandleTypeDef::EndOfSamplingCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC end of sampling callback
- ***void(* __ADC_HandleTypeDef::MspInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp Init callback
- ***void(* __ADC_HandleTypeDef::MspDeInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp DeInit callback

7.2 ADC Firmware driver API description

The following section lists the various functions of the ADC library.

7.2.1 ADC peripheral features

- 12-bit, 10-bit, 8-bit or 6-bit configurable resolution.
- Interrupt generation at the end of regular conversion and in case of analog watchdog or overrun events.
- Single and continuous conversion modes.
- Scan mode for conversion of several channels sequentially.
- Data alignment with in-built data coherency.
- Programmable sampling time (channel wise)
- External trigger (timer or EXTI) with configurable polarity
- DMA request generation for transfer of conversions data of regular group.
- Configurable delay between conversions in Dual interleaved mode.
- ADC channels selectable single/differential input.

- ADC offset shared on 4 offset instances.
- ADC gain compensation
- ADC calibration
- ADC conversion of regular group.
- ADC supply requirements: 1.62 V to 3.6 V.
- ADC input range: from Vref- (connected to Vssa) to Vref+ (connected to Vdda or to an external voltage reference).

7.2.2 How to use this driver

Configuration of top level parameters related to ADC

1. Enable the ADC interface
   - As prerequisite, ADC clock must be configured at RCC top level.
   - Two clock settings are mandatory:
     - ADC clock (core clock, also possibly conversion clock).
     - ADC clock (conversions clock). Two possible clock sources: synchronous clock derived from AHB clock or asynchronous clock derived from system clock, PLL2 or PLL3.
     - Example: Into HAL_ADC_MspInit() (recommended code location) or with other device clock parameters configuration:
     - __HAL_RCC_ADC_CLK_ENABLE(); (mandatory) RCC_ADCCLKSOURCE_PLL2 enable: (optional: if asynchronous clock selected)
     - RCC_PeriphClkInitTypeDef RCC_PeriphClkInit;
     - PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC;
     - PeriphClkInit.AdcClockSelection = RCC_ADCCLKSOURCE_PLL2;
     - HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit);
   - ADC clock source and clock prescaler are configured at ADC level with parameter "ClockPrescaler" using function HAL_ADC_Init().
2. ADC pins configuration
   - Enable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_ENABLE()
   - Configure these ADC pins in analog mode using function HAL_GPIO_Init()
3. Optionally, in case of usage of ADC with interruptions:
   - Configure the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding ADC interruption vector ADCx_IRQHandler().
4. Optionally, in case of usage of DMA:
   - Configure the DMA (DMA channel, mode normal or circular, ...) using function HAL_DMA_Init().
   - Configure the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding DMA interruption vector DMAx_Channelx_IRQHandler().

Configuration of ADC, group regular, channels parameters

1. Configure the ADC parameters (resolution, data alignment, ...) and regular group parameters (conversion trigger, sequencer, ...) using function HAL_ADC_Init().
2. Configure the channels for regular group parameters (channel number, channel rank into sequencer, ..., into regular group) using function HAL_ADC_ConfigChannel().
3. Optionally, configure the analog watchdog parameters (channels monitored, thresholds, ...) using function HAL_ADC_AnalogWDGConfig().

Execution of ADC conversions

1. Optionally, perform an automatic ADC calibration to improve the conversion accuracy using function HAL_ADCEx_Calibration_Start().

2. ADC driver can be used among three modes: polling, interruption, transfer by DMA.
   - ADC conversion by polling:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start()
     - Wait for ADC conversion completion using function HAL_ADC_PollForConversion()
     - Retrieve conversion results using function HAL_ADC_GetValue()
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop()
   - ADC conversion by interruption:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start_IT()
     - Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() (this function must be implemented in user program)
     - Retrieve conversion results using function HAL_ADC_GetValue()
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_IT()
   - ADC conversion with transfer by DMA:
     - Activate the ADC peripheral and start conversions using function HAL_ADC_Start_DMA()
     - Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() or HAL_ADC_ConvHalfCpltCallback() (these functions must be implemented in user program)
     - Conversion results are automatically transferred by DMA into destination variable address.
     - Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_DMA()

Note: Callback functions must be implemented in user program:

- *HAL_ADC_ErrorCallback()*
- *HAL_ADC_LevelOutOfWindowCallback() (callback of analog watchdog)*
- *HAL_ADC_ConvCpltCallback()*
- *HAL_ADC_ConvHalfCpltCallback*

Deinitialization of ADC

1. Disable the ADC interface
   - ADC clock can be hard reset and disabled at RCC top level.
   - Hard reset of ADC peripherals using macro __HAL_RCC_ADCx_FORCE_RESET(), __HAL_RCC_ADCx_RELEASE_RESET().
   - ADC clock disable using the equivalent macro/functions as configuration step.
     - Example: Into HAL_ADC_MspDeInit() (recommended code location) or with other device clock parameters configuration:
     - __HAL_RCC_ADC_CLK_DISABLE(); (if not used anymore) RCC_ADCCLKSOURCE_CLKP restore: (optional)
     - RCC_PeriphClkInitTypeDef RCC_PeriphClkInit;
     - PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADC;
     - PeriphClkInit.AdcClockSelection = RCC_ADCCLKSOURCE_CLKP;
     - HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit);
2. ADC pins configuration
   - Disable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_DISABLE()
3. Optionally, in case of usage of ADC with interruptions:
   - Disable the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
4. Optionally, in case of usage of DMA:
   - Deinitialize the DMA using function HAL_DMA_Init().
   - Disable the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)

Callback registration

The compilation flag USE_HAL_ADC_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_ADC_RegisterCallback() to register an interrupt callback.

Function HAL_ADC_RegisterCallback() allows to register following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback
- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_ADC_UnRegisterCallback to reset a callback to the default weak function.

HAL_ADC_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback
- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback

By default, after the HAL_ADC_Init() and when the state is HAL_ADC_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_ADC_ConvCpltCallback(), HAL_ADC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_ADC_Init()/ HAL_ADC_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_ADC_Init()/ HAL_ADC_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_ADC_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_ADC_STATE_READY or HAL_ADC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_ADC_RegisterCallback() before calling HAL_ADC_DeInit() or HAL_ADC_Init() function.

When the compilation flag USE_HAL_ADC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

7.2.3 Detailed description of functions

HAL_ADC_Init

Function name

HAL_StatusTypeDef HAL_ADC_Init (ADC_HandleTypeDef * hadc)

Function description

HAL_ADC_DeInit

Function name

HAL_StatusTypeDef HAL_ADC_DeInit (ADC_HandleTypeDef * hadc)

Function description

HAL_ADC_MspInit

Function name

void HAL_ADC_MspInit (ADC_HandleTypeDef * hadc)

7.3.1 ADC

ADC

ADC Analog Watchdog filtering configuration

ADC_AWD_FILTERING_NONE

ADC analog watchdog no filtering, one out-of-window sample is needed to raise flag or interrupt

ADC_AWD_FILTERING_2SAMPLES

ADC analog watchdog 2 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_3SAMPLES

ADC analog watchdog 3 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_4SAMPLES

ADC analog watchdog 4 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_5SAMPLES

ADC analog watchdog 5 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_6SAMPLES

ADC analog watchdog 6 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_7SAMPLES

ADC analog watchdog 7 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_8SAMPLES

ADC analog watchdog 8 consecutives out-of-window samples are needed to raise flag or interrupt

ADC analog watchdog (AWD) mode

ADC_ANALOGWATCHDOG_NONE

ADC AWD not selected

ADC_ANALOGWATCHDOG_SINGLE_REG

ADC AWD applied to a regular group single channel

ADC_ANALOGWATCHDOG_SINGLE_INJEC

ADC AWD applied to an injected group single channel

ADC_ANALOGWATCHDOG_SINGLE_REGINJEC

ADC AWD applied to a regular and injected groups single channel

ADC_ANALOGWATCHDOG_ALL_REG

ADC AWD applied to regular group all channels

ADC_ANALOGWATCHDOG_ALL_INJEC

ADC AWD applied to injected group all channels

ADC_ANALOGWATCHDOG_ALL_REGINJEC

ADC AWD applied to regular and injected groups all channels

ADCx CFGR fields

ADC_CFGR1_FIELDS

ADCx CFGR sub fields

ADC_CFGR1_FIELDS_2

ADC Conversion Data Management

ADC_CONVERSIONDATA_DR

ADC conversions data are available in ADC data register only

ADC_CONVERSIONDATA_DMA_ONESHOT

ADC conversion data are transferred by DMA, in limited mode (one shot mode): DMA transfer requests are stopped when number of DMA data transfers (number of ADC conversions) is reached. This ADC mode is intended to be used with DMA mode non-circular.

ADC_CONVERSIONDATA_DMA_CIRCULAR

ADC conversion data are transferred by DMA, in unlimited mode: DMA transfer requests are unlimited, whatever number of DMA data transferred (number of ADC conversions). This ADC mode is intended to be used with DMA mode circular.

ADC_CONVERSIONDATA_MDF

ADC conversion data are transferred to MDF

ADC sequencer end of unitary conversion or sequence conversions

ADC_EOC_SINGLE_CONV

End of unitary conversion flag

ADC_EOC_SEQ_CONV

End of sequence conversions flag

ADC Error Code

HAL_ADC_ERROR_NONE

No error

HAL_ADC_ERROR_INTERNAL

ADC peripheral internal error (problem of clocking, enable/disable, erroneous state, ...)

HAL_ADC_ERROR_OVR

Overrun error

HAL_ADC_ERROR_DMA

DMA transfer error

HAL_ADC_ERROR_INVALID_CALLBACK

Invalid Callback error

ADC Event type

ADC_EOSMP_EVENT

Notes:

- Analog watchdog 1 is available on all stm32 series Analog watchdog 2 and 3 are not available on all series ADC End of Sampling event

ADC_AWD1_EVENT

ADC Analog watchdog 1 event (main analog watchdog)

ADC_AWD2_EVENT

ADC Analog watchdog 2 event (additional analog watchdog)

ADC_AWD3_EVENT

ADC Analog watchdog 3 event (additional analog watchdog)

ADC_OVR_EVENT

ADC overrun event

ADC Exported Constants

ADC_AWD_EVENT

ADC Analog watchdog 1 event: Naming for compatibility with other STM32 devices having only one analog watchdog

ADC flags definition

ADC_FLAG_RDY

ADC Ready flag

ADC_FLAG_EOSMP

ADC End of Sampling flag

ADC_FLAG_EOC

ADC End of Regular Conversion flag

ADC_FLAG_EOS

ADC End of Regular sequence of Conversions flag

ADC_FLAG_OVR

ADC overrun flag

ADC_FLAG_JEOC

ADC End of Injected Conversion flag

ADC_FLAG_JEOS

ADC End of Injected sequence of Conversions flag

ADC_FLAG_AWD1

ADC Analog watchdog 1 flag (main analog watchdog)

ADC_FLAG_AWD2

ADC Analog watchdog 2 flag (additional analog watchdog)

ADC_FLAG_AWD3

ADC Analog watchdog 3 flag (additional analog watchdog)

Analog watchdog - ADC analog watchdog (AWD) number

ADC_ANALOGWATCHDOG_1

ADC analog watchdog number 1

ADC_ANALOGWATCHDOG_2

ADC analog watchdog number 2

ADC_ANALOGWATCHDOG_3

ADC analog watchdog number 3

ADC instance - Channel number

ADC_CHANNEL_0

ADC external channel (connected to GPIO pin) ADCx_IN0

ADC_CHANNEL_1

ADC external channel (connected to GPIO pin) ADCx_IN1

ADC_CHANNEL_2

ADC external channel (connected to GPIO pin) ADCx_IN2

ADC_CHANNEL_3

ADC external channel (connected to GPIO pin) ADCx_IN3

ADC_CHANNEL_4

ADC external channel (connected to GPIO pin) ADCx_IN4

ADC_CHANNEL_5

ADC external channel (connected to GPIO pin) ADCx_IN5

ADC_CHANNEL_6

ADC external channel (connected to GPIO pin) ADCx_IN6

ADC_CHANNEL_7

ADC external channel (connected to GPIO pin) ADCx_IN7

ADC_CHANNEL_8

ADC external channel (connected to GPIO pin) ADCx_IN8

ADC_CHANNEL_9

ADC external channel (connected to GPIO pin) ADCx_IN9

ADC_CHANNEL_10

ADC external channel (connected to GPIO pin) ADCx_IN10

ADC_CHANNEL_11

ADC external channel (connected to GPIO pin) ADCx_IN11

ADC_CHANNEL_12

ADC external channel (connected to GPIO pin) ADCx_IN12

ADC_CHANNEL_13

ADC external channel (connected to GPIO pin) ADCx_IN13

ADC_CHANNEL_14

ADC external channel (connected to GPIO pin) ADCx_IN14

ADC_CHANNEL_15

ADC external channel (connected to GPIO pin) ADCx_IN15

ADC_CHANNEL_16

ADC external channel (connected to GPIO pin) ADCx_IN16

ADC_CHANNEL_17

ADC external channel (connected to GPIO pin) ADCx_IN17

ADC_CHANNEL_18

ADC external channel (connected to GPIO pin) ADCx_IN18

ADC_CHANNEL_19

ADC external channel (connected to GPIO pin) ADCx_IN19

ADC_CHANNEL_VREFINT

ADC internal channel connected to VrefInt: Internal voltage reference. On this STM32 series, ADC channel available only on ADC instance: ADC1.

ADC_CHANNEL_VBAT

ADC internal channel connected to Vbat/4: Vbat voltage through a divider ladder of factor 1/4 to have Vbat always below Vdda. On this STM32 series, ADC channel available only on ADC instance: ADC2.

ADC_CHANNEL_VDDCORE

ADC internal channel connected to VddCore. On this STM32 series, ADC channel available only on ADC instance: ADC2.

Channel - Sampling time

ADC_SAMPLETIME_1CYCLE_5

Sampling time 1.5 ADC clock cycle

ADC_SAMPLETIME_2CYCLES_5

Sampling time 2.5 ADC clock cycles

ADC_SAMPLETIME_6CYCLES_5

Sampling time 6.5 ADC clock cycles

ADC_SAMPLETIME_11CYCLES_5

Sampling time 11.5 ADC clock cycles

ADC_SAMPLETIME_23CYCLES_5

Sampling time 23.5 ADC clock cycles

ADC_SAMPLETIME_46CYCLES_5

Sampling time 46.5 ADC clock cycles

ADC_SAMPLETIME_246CYCLES_5

Sampling time 246.5 ADC clock cycles

ADC_SAMPLETIME_1499CYCLES_5

Sampling time 1499.5 ADC clock cycles

Channel - Single or differential ending

ADC_SINGLE_ENDED

ADC channel ending set to single ended

ADC_DIFFERENTIAL_ENDED

ADC channel ending set to differential

ADC instance - Groups

ADC_REGULAR_GROUP

ADC group regular (available on all STM32 devices)

ADC_INJECTED_GROUP

ADC group injected (not available on all STM32 devices)

ADC_REGULAR_INJECTED_GROUP

ADC both groups regular and injected

Multimode - Mode

ADC_MODE_INDEPENDENT

ADC dual mode disabled (ADC independent mode)

ADC_DUALMODE_REGSIMULT

ADC dual mode enabled: group regular simultaneous

ADC_DUALMODE_INTERL

ADC dual mode enabled: Combined group regular interleaved

ADC_DUALMODE_INJECSIMULT

ADC dual mode enabled: group injected simultaneous

ADC_DUALMODE_ALTERTRIG

ADC dual mode enabled: group injected alternate trigger. Works only with external triggers (not internal SW start)

ADC_DUALMODE_REGSIMULT_INJECSIMULT

ADC dual mode enabled: Combined group regular simultaneous + group injected simultaneous

ADC_DUALMODE_REGSIMULT_ALTERTRIG

ADC dual mode enabled: Combined group regular simultaneous + group injected alternate trigger

ADC_DUALMODE_REGINTERL_INJECSIMULT

ADC dual mode enabled: Combined group regular interleaved + group injected simultaneous

Multimode - Delay between two sampling phases

ADC_TWOSAMPLINGDELAY_1CYCLE

ADC multimode delay between two sampling phases: 1 ADC clock cycle

ADC_TWOSAMPLINGDELAY_2CYCLES

ADC multimode delay between two sampling phases: 2 ADC clock cycles

ADC_TWOSAMPLINGDELAY_3CYCLES

ADC multimode delay between two sampling phases: 3 ADC clock cycles

ADC_TWOSAMPLINGDELAY_4CYCLES

ADC multimode delay between two sampling phases: 4 ADC clock cycles

ADC_TWOSAMPLINGDELAY_5CYCLES

ADC multimode delay between two sampling phases: 5 ADC clock cycles

ADC_TWOSAMPLINGDELAY_6CYCLES

ADC multimode delay between two sampling phases: 6 ADC clock cycles

ADC_TWOSAMPLINGDELAY_7CYCLES

ADC multimode delay between two sampling phases: 7 ADC clock cycles

ADC_TWOSAMPLINGDELAY_8CYCLES

ADC multimode delay between two sampling phases: 8 ADC clock cycles

ADC_TWOSAMPLINGDELAY_9CYCLES

ADC multimode delay between two sampling phases: 9 ADC clock cycles

ADC_TWOSAMPLINGDELAY_10CYCLES

ADC multimode delay between two sampling phases: 10 ADC clock cycles

ADC_TWOSAMPLINGDELAY_11CYCLES

ADC multimode delay between two sampling phases: 11 ADC clock cycles

ADC_TWOSAMPLINGDELAY_12CYCLES

ADC multimode delay between two sampling phases: 12 ADC clock cycles

ADC_TWOSAMPLINGDELAY_13CYCLES

ADC multimode delay between two sampling phases: 13 ADC clock cycles

ADC instance - Offset number

ADC_OFFSET_NONE

ADC offset disabled: no offset correction for the selected ADC channel

ADC_OFFSET_1

ADC offset number 1: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_2

ADC offset number 2: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_3

ADC offset number 3: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_4

ADC offset number 4: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

Oversampling - Discontinuous mode

ADC_TRIGGEREDMODE_SINGLE_TRIGGER

ADC oversampling discontinuous mode: continuous mode (all conversions of OVS ratio are done from 1 trigger)

ADC_TRIGGEREDMODE_MULTI_TRIGGER

ADC oversampling discontinuous mode: discontinuous mode (each conversion of OVS ratio needs a trigger)

Oversampling - Oversampling scope for ADC group regular

ADC_REGOVERSAMPLING_CONTINUED_MODE

Oversampling buffer maintained during injection sequence

ADC_REGOVERSAMPLING_RESUMED_MODE

Oversampling buffer zeroed during injection sequence

Oversampling - Data shift

ADC_RIGHTBITSHIFT_NONE

ADC oversampling no shift

ADC_RIGHTBITSHIFT_1

ADC oversampling right shift of 1 ranks

ADC_RIGHTBITSHIFT_2

ADC oversampling right shift of 2 ranks

ADC_RIGHTBITSHIFT_3

ADC oversampling right shift of 3 ranks

ADC_RIGHTBITSHIFT_4

ADC oversampling right shift of 4 ranks

ADC_RIGHTBITSHIFT_5

ADC oversampling right shift of 5 ranks

ADC_RIGHTBITSHIFT_6

ADC oversampling right shift of 6 ranks

ADC_RIGHTBITSHIFT_7

ADC oversampling right shift of 7 ranks

ADC_RIGHTBITSHIFT_8

ADC oversampling right shift of 8 ranks

ADC_RIGHTBITSHIFT_9

ADC oversampling right shift of 9 ranks

ADC_RIGHTBITSHIFT_10

ADC oversampling right shift of 10 ranks

ADC group regular - Overrun behavior on conversion data

ADC_OVR_DATA_PRESERVED

ADC group regular behavior in case of overrun: data preserved

ADC_OVR_DATA_OVERWRITTEN

ADC group regular behavior in case of overrun: data overwritten

ADC group regular - Sequencer ranks

ADC_REGULAR_RANK_1

ADC group regular sequencer rank 1

ADC_REGULAR_RANK_2

ADC group regular sequencer rank 2

ADC_REGULAR_RANK_3

ADC group regular sequencer rank 3

ADC_REGULAR_RANK_4

ADC group regular sequencer rank 4

ADC_REGULAR_RANK_5

ADC group regular sequencer rank 5

ADC_REGULAR_RANK_6

ADC group regular sequencer rank 6

ADC_REGULAR_RANK_7

ADC group regular sequencer rank 7

ADC_REGULAR_RANK_8

ADC group regular sequencer rank 8

ADC_REGULAR_RANK_9

ADC group regular sequencer rank 9

ADC_REGULAR_RANK_10

ADC group regular sequencer rank 10

ADC_REGULAR_RANK_11

ADC group regular sequencer rank 11

ADC_REGULAR_RANK_12

ADC group regular sequencer rank 12

ADC_REGULAR_RANK_13

ADC group regular sequencer rank 13

ADC_REGULAR_RANK_14

ADC group regular sequencer rank 14

ADC_REGULAR_RANK_15

ADC group regular sequencer rank 15

ADC_REGULAR_RANK_16

ADC group regular sequencer rank 16

ADC instance - Resolution

ADC_RESOLUTION_12B

ADC resolution 12 bits

ADC_RESOLUTION_10B

ADC resolution 10 bits

ADC_RESOLUTION_8B

ADC resolution 8 bits

ADC_RESOLUTION_6B

ADC resolution 6 bits

HAL ADC macro to manage HAL ADC handle, IT and flags.

__HAL_ADC_RESET_HANDLE_STATE

Description:

- Reset ADC handle state.

Parameters:

- __HANDLE__: ADC handle

Return value:

- None

__HAL_ADC_ENABLE_IT

Description:

- Enable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)

Return value:

- None

__HAL_ADC_DISABLE_IT

Description:

- Disable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)

Return value:

- None

__HAL_ADC_GET_IT_SOURCE

Description:

- Checks if the specified ADC interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC interrupt source to check This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)

Return value:

- State: of interruption (SET or RESET)

__HAL_ADC_GET_FLAG

Description:

- Check whether the specified ADC flag is set or not.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)

Return value:

- State: of flag (TRUE or FALSE).

__HAL_ADC_CLEAR_FLAG

Description:

- Clear the specified ADC flag.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)

Return value:

- None

HAL ADC helper macro

__HAL_ADC_CHANNEL_TO_DECIMAL_NB

Description:

- Helper macro to get ADC channel number in decimal format from literals ADC_CHANNEL_x.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)(4)
  - ADC_CHANNEL_VBAT (2)(4)
  - ADC_CHANNEL_VDDCORE (2)(4)

Return value:

- Value: between Min_Data=0 and Max_Data=18

Notes:

- Example: __HAL_ADC_CHANNEL_TO_DECIMAL_NB(ADC_CHANNEL_4) will return decimal number "4". The input can be a value from functions where a channel number is returned, either defined with number or with bitfield (only one bit must be set).

__HAL_ADC_DECIMAL_NB_TO_CHANNEL

Description:

- Helper macro to get ADC channel in literal format ADC_CHANNEL_x from number in decimal format.

Parameters:

- __DECIMAL_NB__: Value between Min_Data=0 and Max_Data=18

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)(3)
  - ADC_CHANNEL_VBAT (2)(3)
  - ADC_CHANNEL_VDDCORE (2)(3)

Notes:

- Example: __HAL_ADC_DECIMAL_NB_TO_CHANNEL(4) will return a data equivalent to "ADC_CHANNEL_4".

__HAL_ADC_IS_CHANNEL_INTERNAL

Description:

- Helper macro to determine whether the selected channel corresponds to literal definitions of driver.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)(4)
  - ADC_CHANNEL_VBAT (2)(4)
  - ADC_CHANNEL_VDDCORE (2)(4)

Return value:

- Value: "0" if the channel corresponds to a parameter definition of a ADC external channel (channel connected to a GPIO pin). Value "1" if the channel corresponds to a parameter definition of a ADC internal channel.

Notes:

- The different literal definitions of ADC channels are: ADC internal channel: ADC_CHANNEL_VREFINT, ...ADC external channel (channel connected to a GPIO pin): ADC_CHANNEL_1, ADC_CHANNEL_2, ... The channel parameter must be a value defined from literal definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ...), ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...), must not be a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_CHANNEL_INTERNAL_TO_EXTERNAL

Description:

- Helper macro to convert a channel defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ...), to its equivalent parameter definition of a ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...).

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)(4)
  - ADC_CHANNEL_VBAT (2)(4)
  - ADC_CHANNEL_VDDCORE (2)(4)

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19

Notes:

- The channel parameter can be, additionally to a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ...), a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers.

__HAL_ADC_IS_CHANNEL_INTERNAL_AVAILABLE

Description:

- Helper macro to determine whether the internal channel selected is available on the ADC instance selected.

Parameters:

- __ADC_INSTANCE__: ADC instance
- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VDDCORE (2)

Return value:

- Value: "0" if the internal channel selected is not available on the ADC instance selected. Value "1" if the internal channel selected is available on the ADC instance selected.

Notes:

- The channel parameter must be a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ...), must not be a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_MULTI_CONV_DATA_MASTER_SLAVE

Description:

- Helper macro to get the ADC multimode conversion data of ADC master or ADC slave from raw value with both ADC conversion data concatenated.

Parameters:

- __ADC_MULTI_MASTER_SLAVE__: This parameter can be one of the following values:
  - LL_ADC_MULTI_MASTER
  - LL_ADC_MULTI_SLAVE
- __ADC_MULTI_CONV_DATA__: Value between Min_Data=0x000 and Max_Data=0xFFF

Return value:

- Value: between Min_Data=0x000 and Max_Data=0xFFF

Notes:

- This macro is intended to be used when multimode transfer by DMA is enabled: refer to function __LL_ADC_MULTI_CONV_DATA_MASTER_SLAVE(). In this case the transferred data need to processed with this macro to separate the conversion data of ADC master and ADC slave.

__HAL_ADC_COMMON_INSTANCE

Description:

- Helper macro to select the ADC common instance to which is belonging the selected ADC instance.

Parameters:

- __ADCx__: ADC instance

Return value:

- ADC: common register instance

Notes:

- ADC common register instance can be used for: Set parameters common to several ADC instancesMultimode (for devices with several ADC instances) Refer to functions having argument "ADCxy_COMMON" as parameter.

__HAL_ADC_IS_ENABLED_ALL_COMMON_INSTANCE

Description:

- Helper macro to check if all ADC instances sharing the same ADC common instance are disabled.

Parameters:

- __ADCXY_COMMON__: ADC common instance (can be set directly from CMSIS definition or by using helper macro

Return value:

- Value: "0" if all ADC instances sharing the same ADC common instance are disabled. Value "1" if at least one ADC instance sharing the same ADC common instance is enabled.

Notes:

- This check is required by functions with setting conditioned to ADC state: All ADC instances of the ADC common group must be disabled. Refer to functions having argument "ADCxy_COMMON" as parameter. On devices with only 1 ADC common instance, parameter of this macro is useless and can be ignored (parameter kept for compatibility with devices featuring several ADC common instances).

__HAL_ADC_DIGITAL_SCALE

Description:

- Helper macro to define the ADC conversion data full-scale digital value corresponding to the selected ADC resolution.

Parameters:

- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data full-scale digital value

Notes:

- ADC conversion data full-scale corresponds to voltage range determined by analog voltage references Vref+ and Vref- (refer to reference manual).

__HAL_ADC_CONVERT_DATA_RESOLUTION

Description:

- Helper macro to convert the ADC conversion data from a resolution to another resolution.

Parameters:

- __DATA__: ADC conversion data to be converted
- __ADC_RESOLUTION_CURRENT__: Resolution of to the data to be converted This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B
- __ADC_RESOLUTION_TARGET__: Resolution of the data after conversion This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data to the requested resolution

__HAL_ADC_CALC_DATA_TO_VOLTAGE

Description:

- Helper macro to calculate the voltage (unit: mVolt) corresponding to a ADC conversion data (unit: digital value).

Parameters:

- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __ADC_DATA__: ADC conversion data (resolution 12 bits) (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data equivalent voltage value (unit: mVolt)

Notes:

- Analog reference voltage (Vref+) must be either known from user board environment.

__HAL_ADC_CALC_DIFF_DATA_TO_VOLTAGE

Description:

- Helper macro to calculate the voltage (unit: mVolt) corresponding to a ADC conversion data (unit: digital value) in differential ended mode.

Parameters:

- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __ADC_DATA__: ADC conversion data (resolution 12 bits) (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data equivalent voltage value (unit: mVolt)

Notes:

- Analog reference voltage (Vref+) must be either known from user board environment.

ADC group injected trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGINJECCONV_EDGE_NONE

Injected conversions trigger disabled (SW start)

ADC_EXTERNALTRIGINJECCONV_EDGE_RISING

Injected conversions trigger polarity set to rising edge

ADC_EXTERNALTRIGINJECCONV_EDGE_FALLING

Injected conversions trigger polarity set to falling edge

ADC_EXTERNALTRIGINJECCONV_EDGE_RISINGFALLING

Injected conversions trigger polarity set to both rising and falling edges

ADC group injected trigger source

ADC_INJECTED_SOFTWARE_START

ADC group injected conversion trigger internal: SW start.

ADC_EXTERNALTRIGINJEC_EXT_IT15

ADC group injected conversion trigger from external peripheral: external interrupt line 15.

ADC_EXTERNALTRIGINJEC_T1_CC4

ADC group injected conversion trigger from external peripheral: TIM1 channel 4 event (capture compare).

ADC_EXTERNALTRIGINJEC_T1_TRGO

ADC group injected conversion trigger from external peripheral: TIM1 TRGO event.

ADC_EXTERNALTRIGINJEC_T1_TRGO2

ADC group injected conversion trigger from external peripheral: TIM1 TRGO2 event.

ADC_EXTERNALTRIGINJEC_T2_CC1

ADC group injected conversion trigger from external peripheral: TIM2 channel 1 event (capture compare).

ADC_EXTERNALTRIGINJEC_T2_TRGO

ADC group injected conversion trigger from external peripheral: TIM2 TRGO event.

ADC_EXTERNALTRIGINJEC_T3_CC1

ADC group injected conversion trigger from external peripheral: TIM3 channel 1 event (capture compare).

ADC_EXTERNALTRIGINJEC_T3_CC3

ADC group injected conversion trigger from external peripheral: TIM3 channel 3 event (capture compare).

ADC_EXTERNALTRIGINJEC_T3_CC4

ADC group injected conversion trigger from external peripheral: TIM3 channel 4 event (capture compare).

ADC_EXTERNALTRIGINJEC_T3_TRGO

ADC group injected conversion trigger from external peripheral: TIM3 TRGO event.

ADC_EXTERNALTRIGINJEC_T4_TRGO

ADC group injected conversion trigger from external peripheral: TIM4 TRGO event.

ADC_EXTERNALTRIGINJEC_T5_TRGO

ADC group injected conversion trigger from external peripheral: TIM5 TRGO event.

ADC_EXTERNALTRIGINJEC_T6_TRGO

ADC group injected conversion trigger from external peripheral: TIM6 TRGO event.

ADC_EXTERNALTRIGINJEC_T7_TRGO

ADC group injected conversion trigger from external peripheral: TIM7 TRGO event.

ADC_EXTERNALTRIGINJEC_T8_TRGO

ADC group injected conversion trigger from external peripheral: TIM8 TRGO event.

ADC_EXTERNALTRIGINJEC_T8_TRGO2

ADC group injected conversion trigger from external peripheral: TIM8 TRGO2 event.

ADC_EXTERNALTRIGINJEC_T9_CC2

ADC group injected conversion trigger from external peripheral: TIM9 channel 2 event (capture compare).

ADC_EXTERNALTRIGINJEC_T9_TRGO

ADC group injected conversion trigger from external peripheral: TIM9 TRGO event.

ADC_EXTERNALTRIGINJEC_T12_TRGO

ADC group injected conversion trigger from external peripheral: TIM12 TRGO event.

ADC_EXTERNALTRIGINJEC_T12_CC4

ADC group injected conversion trigger from external peripheral: TIM12 channel 4 event (capture compare).

ADC_EXTERNALTRIGINJEC_T15_TRGO

ADC group injected conversion trigger from external peripheral: TIM12 TRGO event.

ADC_EXTERNALTRIGINJEC_T18_TRGO

ADC group injected conversion trigger from external peripheral: TIM12 TRGO event.

ADC_EXTERNALTRIGINJEC_LPTIM1_CH2

ADC group injected conversion trigger from external peripheral: LPTIM1 channel 2 event.

ADC_EXTERNALTRIGINJEC_LPTIM2_CH2

ADC group injected conversion trigger from external peripheral: LPTIM2 channel 2 event.

ADC_EXTERNALTRIGINJEC_LPTIM3_CH2

ADC group injected conversion trigger from external peripheral: LPTIM3 channel 2 event.

ADC group injected - Sequencer ranks

ADC_INJECTED_RANK_1

ADC group injected sequencer rank 1

ADC_INJECTED_RANK_2

ADC group injected sequencer rank 2

ADC_INJECTED_RANK_3

ADC group injected sequencer rank 3

ADC_INJECTED_RANK_4

ADC group injected sequencer rank 4

ADC interrupts definition

ADC_IT_RDY

ADC Ready interrupt source

ADC_IT_EOSMP

ADC End of sampling interrupt source

ADC_IT_EOC

ADC End of regular conversion interrupt source

ADC_IT_EOS

ADC End of regular sequence of conversions interrupt source

ADC_IT_OVR

ADC overrun interrupt source

ADC_IT_JEOC

ADC End of injected conversion interrupt source

ADC_IT_JEOS

ADC End of injected sequence of conversions interrupt source

ADC_IT_AWD1

ADC Analog watchdog 1 interrupt source (main analog watchdog)

ADC_IT_AWD2

ADC Analog watchdog 2 interrupt source (additional analog watchdog)

ADC_IT_AWD3

ADC Analog watchdog 3 interrupt source (additional analog watchdog)

ADC group regular trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGCONVEDGE_NONE

ADC group regular trigger disabled (SW start)

ADC_EXTERNALTRIGCONVEDGE_RISING

ADC group regular conversion trigger polarity set to rising edge

ADC_EXTERNALTRIGCONVEDGE_FALLING

ADC group regular conversion trigger polarity set to falling edge

ADC_EXTERNALTRIGCONVEDGE_RISINGFALLING

ADC group regular conversion trigger polarity set to both rising and falling edges

ADC group regular trigger source

ADC_SOFTWARE_START

ADC group regular conversion trigger internal: SW start.

ADC_EXTERNALTRIG_EXT_IT11

ADC group regular conversion trigger from external peripheral: external interrupt line 11.

ADC_EXTERNALTRIG_T1_CC1

ADC group regular conversion trigger from external peripheral: TIM1 channel 1 event (capture compare).

ADC_EXTERNALTRIG_T1_CC2

ADC group regular conversion trigger from external peripheral: TIM1 channel 2 event (capture compare).

ADC_EXTERNALTRIG_T1_CC3

ADC group regular conversion trigger from external peripheral: TIM1 channel 3 event (capture compare).

ADC_EXTERNALTRIG_T1_TRGO

ADC group regular conversion trigger from external peripheral: TIM1 TRGO event.

ADC_EXTERNALTRIG_T1_TRGO2

ADC group regular conversion trigger from external peripheral: TIM1 TRGO2 event.

ADC_EXTERNALTRIG_T2_CC2

ADC group regular conversion trigger from external peripheral: TIM2 channel 2 event (capture compare).

ADC_EXTERNALTRIG_T2_TRGO

ADC group regular conversion trigger from external peripheral: TIM2 TRGO event.

ADC_EXTERNALTRIG_T3_CC4

ADC group regular conversion trigger from external peripheral: TIM3 channel 4 event (capture compare).

ADC_EXTERNALTRIG_T3_TRGO

ADC group regular conversion trigger from external peripheral: TIM3 TRGO event.

ADC_EXTERNALTRIG_T4_CC4

ADC group regular conversion trigger from external peripheral: TIM4 channel 4 event (capture compare).

ADC_EXTERNALTRIG_T4_TRGO

ADC group regular conversion trigger from external peripheral: TIM4 TRGO event.

ADC_EXTERNALTRIG_T5_TRGO

ADC group regular conversion trigger from external peripheral: TIM5 TRGO event.

ADC_EXTERNALTRIG_T6_TRGO

ADC group regular conversion trigger from external peripheral: TIM6 TRGO event.

ADC_EXTERNALTRIG_T7_TRGO

ADC group regular conversion trigger from external peripheral: TIM7 TRGO event.

ADC_EXTERNALTRIG_T8_TRGO

ADC group regular conversion trigger from external peripheral: TIM8 TRGO event.

ADC_EXTERNALTRIG_T8_TRGO2

ADC group regular conversion trigger from external peripheral: TIM8 TRGO2 event.

ADC_EXTERNALTRIG_T9_CC1

ADC group regular conversion trigger from external peripheral: TIM9 channel 1 event (capture compare).

ADC_EXTERNALTRIG_T9_TRGO

ADC group regular conversion trigger from external peripheral: TIM9 TRGO event.

ADC_EXTERNALTRIG_T12_TRGO

ADC group regular conversion trigger from external peripheral: TIM12 TRGO event.

ADC_EXTERNALTRIG_T15_TRGO

ADC group regular conversion trigger from external peripheral: TIM15 TRGO event.

ADC_EXTERNALTRIG_T18_TRGO

ADC group regular conversion trigger from external peripheral: TIM18 TRGO event.

ADC_EXTERNALTRIG_LPTIM1_CH1

ADC group regular conversion trigger from external peripheral: LPTIM1 channel 1 event.

ADC_EXTERNALTRIG_LPTIM2_CH1

ADC group regular conversion trigger from external peripheral: LPTIM2 channel 2 event.

ADC_EXTERNALTRIG_LPTIM3_CH1

ADC group regular conversion trigger from external peripheral: LPTIM3 channel 3 event.

ADC group regular sampling mode

ADC_SAMPLING_MODE_NORMAL

ADC conversions sampling phase duration is defined using

ADC_SAMPLING_MODE_BULB

ADC conversions sampling phase starts immediately after end of conversion, and stops upon trigger event. Note: First conversion is using minimal sampling time (see

ADC_SAMPLING_MODE_TRIGGER_CONTROLED

ADC conversions sampling phase is controlled by trigger events: Trigger rising edge = start sampling Trigger falling edge = stop sampling and start conversion

ADC sequencer scan mode

ADC_SCAN_DISABLE

Scan mode disabled

ADC_SCAN_ENABLE

Scan mode enabled

ADC_CHSELR_SQ2_TO_SQ8

ADCx SMPR1 fields

ADC_SMPR1_FIELDS

ADC States

HAL_ADC_STATE_RESET

Notes:

- ADC state machine is managed by bitfields, state must be compared with bit by bit. For example: " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_REG_BUSY) != 0UL) " " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_AWD1) != 0UL) " ADC not yet initialized or disabled

HAL_ADC_STATE_READY

ADC peripheral ready for use

HAL_ADC_STATE_BUSY_INTERNAL

ADC is busy due to an internal process (initialization, calibration, ...)

HAL_ADC_STATE_TIMEOUT

TimeOut occurrence

HAL_ADC_STATE_ERROR_INTERNAL

Internal error occurrence

HAL_ADC_STATE_ERROR_CONFIG

Configuration error occurrence

HAL_ADC_STATE_ERROR_DMA

DMA error occurrence

HAL_ADC_STATE_REG_BUSY

A conversion on ADC group regular is ongoing or can occur (either by continuous mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_REG_EOC

Conversion data available on group regular

HAL_ADC_STATE_REG_OVR

Overrun occurrence

HAL_ADC_STATE_REG_EOSMP

Not available on this STM32 series: End Of Sampling flag raised

HAL_ADC_STATE_INJ_BUSY

A conversion on ADC group injected is ongoing or can occur (either by auto-injection mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_INJ_EOC

Conversion data available on group injected

HAL_ADC_STATE_AWD1

Out-of-window occurrence of ADC analog watchdog 1

HAL_ADC_STATE_AWD2

Out-of-window occurrence of ADC analog watchdog 2

HAL_ADC_STATE_AWD3

Out-of-window occurrence of ADC analog watchdog 3

HAL_ADC_STATE_MULTIMODE_SLAVE

ADC in multimode slave state, controlled by another ADC master (when feature available)

8 HAL ADC Extension Driver

8.1 ADCEx Firmware driver registers structures

8.1.1 ADC_InjOversamplingTypeDef

ADC_InjOversamplingTypeDef is defined in the stm32n6xx_hal_adc_ex.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***

Field Documentation

- ***uint32_t ADC_InjOversamplingTypeDef::Ratio***
  Configures the oversampling ratio. This parameter can be a value from 1 to 1024
- ***uint32_t ADC_InjOversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***

8.1.2 ADC_InjectionConfTypeDef

ADC_InjectionConfTypeDef is defined in the stm32n6xx_hal_adc_ex.h

Data Fields

- ***uint32_t InjectedChannel***
- ***uint32_t InjectedRank***
- ***uint32_t InjectedSamplingTime***
- ***uint32_t InjectedSingleDiff***
- ***uint32_t InjectedOffsetNumber***
- ***uint32_t InjectedOffset***
- ***FunctionalState InjectedOffsetSignedSaturation***
- ***uint32_t InjectedOffsetSign***
- ***FunctionalState InjectedOffsetSaturation***
- ***uint32_t InjectedNbrOfConversion***
- ***FunctionalState InjectedDiscontinuousConvMode***
- ***FunctionalState AutoInjectedConv***
- ***uint32_t ExternalTrigInjecConv***
- ***uint32_t ExternalTrigInjecConvEdge***
- ***FunctionalState InjecOversamplingMode***
- ***ADC_InjOversamplingTypeDef InjecOversampling***

Field Documentation

- ***uint32_t ADC_InjectionConfTypeDef::InjectedChannel***
  Specifies the channel to configure into ADC group injected. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedRank***
  Specifies the rank in the ADC group injected sequencer. This parameter must be a value of ***ADC_INJ_SEQ_RANKS***. Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted)

- ***uint32_t ADC_InjectionConfTypeDef::InjectedSamplingTime***
  Sampling time value to be set for the selected channel. Unit: ADC clock cycles. Conversion time is the addition of sampling time and processing time (13.5 ADC clock cycles at ADC resolution 12 bits, 11.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME***. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting); Refer to device datasheet for timings values.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedSingleDiff***
  Selection of single-ended or differential input. In differential mode: Differential measurement is carried out between the selected channel (positive input) and another channel (negative input). Refer to reference manual for corresponding channel. Only channel of positive input has to be configured, the other channel is configured automatically. This parameter must be a value of:
  ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetNumber***
  Selects the offset number. This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB***. Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffset***
  Defines the offset to be subtracted from the raw converted data. Offset value must be a positive number. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_InjectionConfTypeDef::InjectedOffsetSignedSaturation***
  Specifies whether the Signed saturation feature is used or not. This parameter is applied only for 14-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetSign***
  Define if the offset should be subtracted (negative sign) or added (positive sign) from or to the raw converted data. This parameter can be a value of ***ADCEx_OffsetSign***. Note:
  - This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled or ADC enabled without continuous mode or external trigger that could launch a conversion).
  - This parameter is specific to ADC1 only.
- ***FunctionalState ADC_InjectionConfTypeDef::InjectedOffsetSaturation***
  Define if the offset should be saturated upon under or over flow. This parameter value can be ENABLE or DISABLE. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***uint32_t ADC_InjectionConfTypeDef::InjectedNbrOfConversion***
  Specifies the number of ranks that will be converted within the ADC group injected sequencer. To use the injected group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min_Data = 1 and Max_Data = 4. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::InjectedDiscontinuousConvMode***
  Specifies whether the conversions sequence of ADC group injected is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). Note: For injected group, discontinuous mode converts the sequence channel by channel (discontinuous length fixed to 1 rank). Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

- ***FunctionalState ADC_InjectionConfTypeDef::AutoInjectedConv***
  Enables or disables the selected ADC group injected automatic conversion after regular one This parameter can be set to ENABLE or DISABLE. Note: To use Automatic injected conversion, discontinuous mode must be disabled ('DiscontinuousConvMode' and 'InjectedDiscontinuousConvMode' set to DISABLE) Note: To use Automatic injected conversion, injected group external triggers must be disabled ('ExternalTrigInjecConv' set to ADC_INJECTED_SOFTWARE_START) Note: In case of DMA used with regular group: if DMA configured in normal mode (single shot) JAUTO will be stopped upon DMA transfer complete. To maintain JAUTO always enabled, DMA must be configured in circular mode. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConv***
  Selects the external event used to trigger the conversion start of injected group. If set to ADC_INJECTED_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_injected_external_trigger_source***. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConvEdge***
  Selects the external trigger edge of injected group. This parameter can be a value of ***ADC_injected_external_trigger_edge***. If trigger source is set to ADC_INJECTED_SOFTWARE_START, this parameter is discarded. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::InjecOversamplingMode***
  Specifies whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).
- ***ADC_InjOversamplingTypeDef ADC_InjectionConfTypeDef::InjecOversampling***
  Specifies the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling already enabled. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).

8.1.3 ADC_MultiModeTypeDef

ADC_MultiModeTypeDef is defined in the stm32n6xx_hal_adc_ex.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t DualModeData***
- ***uint32_t TwoSamplingDelay***

Field Documentation

- ***uint32_t ADC_MultiModeTypeDef::Mode***
  Configures the ADC to operate in independent or multimode. This parameter can be a value of ***ADC_HAL_EC_MULTI_MODE***.
- ***uint32_t ADC_MultiModeTypeDef::DualModeData***
  Configures the Dual ADC Mode Data Format: This parameter can be a value of ***ADCEx_Dual_Mode_Data_Format***
- ***uint32_t ADC_MultiModeTypeDef::TwoSamplingDelay***
  Configures the Delay between 2 sampling phases. This parameter can be a value of ***ADC_HAL_EC_MULTI_TWOSMP_DELAY***

8.2 ADCEx Firmware driver API description

The following section lists the various functions of the ADCEx library.

8.2.1 Detailed description of functions

HAL_ADCEx_Calibration_Start

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_Start (ADC_HandleTypeDef * hadc, uint32_t SingleDiff)

Function description

HAL_ADCEx_Calibration_GetValue

Function name

uint32_t HAL_ADCEx_Calibration_GetValue (const ADC_HandleTypeDef * hadc, uint32_t SingleDiff)

Function description

HAL_ADCEx_Calibration_SetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_SetValue (ADC_HandleTypeDef * hadc, uint32_t SingleDiff, uint32_t CalibrationFactor)

Function description

HAL_ADCEx_InjectedStart

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_InjectedStop

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_InjectedPollForConversion

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedPollForConversion (ADC_HandleTypeDef * hadc, uint32_t Timeout)

Function description

HAL_ADCEx_InjectedStart_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart_IT (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_InjectedStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop_IT (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_MultiModeStart_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStart_DMA (ADC_HandleTypeDef * hadc, uint32_t * pData, uint32_t Length)

Function description

HAL_ADCEx_MultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_MultiModeGetValue

Function name

uint32_t HAL_ADCEx_MultiModeGetValue (const ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_InjectedGetValue

Function name

uint32_t HAL_ADCEx_InjectedGetValue (const ADC_HandleTypeDef * hadc, uint32_t InjectedRank)

Function description

HAL_ADCEx_InjectedGetSignedValue

Function name

int32_t HAL_ADCEx_InjectedGetSignedValue (const ADC_HandleTypeDef * hadc, uint32_t InjectedRank)

Function description

HAL_ADCEx_InjectedConvCpltCallback

Function name

void HAL_ADCEx_InjectedConvCpltCallback (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_LevelOutOfWindow2Callback

Function name

void HAL_ADCEx_LevelOutOfWindow2Callback (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_LevelOutOfWindow3Callback

Function name

void HAL_ADCEx_LevelOutOfWindow3Callback (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_EndOfSamplingCallback

Function name

void HAL_ADCEx_EndOfSamplingCallback (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_RegularStop

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_RegularStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_IT (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_RegularStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_DMA (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_RegularMultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularMultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

HAL_ADCEx_InjectedConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedConfigChannel (ADC_HandleTypeDef * hadc, const ADC_InjectionConfTypeDef * pConfigInjected)

Function description

HAL_ADCEx_MultiModeConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeConfigChannel (ADC_HandleTypeDef * hadc, const ADC_MultiModeTypeDef * pMultimode)

Function description

HAL_ADCEx_EnterADCDeepPowerDownMode

Function name

HAL_StatusTypeDef HAL_ADCEx_EnterADCDeepPowerDownMode (ADC_HandleTypeDef * hadc)

Function description

8.3 ADCEx Firmware driver defines

The following section lists the various define and macros of the module.

8.3.1 ADCEx

ADCEx

ADC Extended Dual Mode Data Formatting

ADC_DUALMODEDATAFORMAT_DISABLED

ADC multimode group regular data format: conversion data in data register of each ADC instance. If ADC data transfer by DMA is used: each ADC uses its own DMA channel, with its individual DMA transfer settings.

ADC_DUALMODEDATAFORMAT_32_BIT

ADC multimode group regular data format: conversion data in two ADC common instance data registers (CDR, CDR2) with packing option on 32 bit. In register CDR, data packing on 32 bit: ADC master and slave data are concatenated (data master in [15; 0], data slave in [31; 16]), therefore data width must be lower than 16 bit (even with ADC resolution 12 bit, higher width reachable by post processing: oversampling, offset, ...). In register CDR2, data of master and slave are alternatively set in full register width 32 bit, therefore no constraint on data width. In case of usage with DMA, CDR generate ones transfer request and CDR2 two transfer requests per conversion.

ADC_DUALMODEDATAFORMAT_8_BIT

ADC multimode group regular data format: conversion data in two ADC common instance data registers (CDR, CDR2) with packing option on 16 bit. In register CDR, data packing on 16 bit: ADC master and slave data are concatenated (data master in [7; 0], data slave in [15; 8]), therefore data width must be lower than 8 bit (even with ADC resolution 8 bit, higher width reachable by post processing: oversampling, offset, ...). In register CDR2, data of master and slave are alternatively set in full register width 32 bit, therefore no constraint on data width. In case of usage with DMA, CDR generate ones transfer request and CDR2 two transfer requests per conversion.

ADC_DUALMODEDATAFORMAT_32_10_BITS

ADC_DUALMODEDATAFORMAT_8_BITS

ADC Extended Exported Macros

ADC_FORCE_MODE_INDEPENDENT

Description:

- Force ADC instance in multimode mode independent (multimode disable).

Parameters:

- __HANDLE__: ADC handle.

Return value:

- None

Notes:

- This macro must be used only in case of transition from multimode to mode independent and in case of unknown previous state, to ensure ADC configuration is in mode independent. Standard way of multimode configuration change is done from HAL ADC handle of ADC master using function "HAL_ADCEx_MultiModeConfigChannel(..., ADC_MODE_INDEPENDENT)")". Usage of this macro is not the Standard way of multimode configuration and can lead to have HAL ADC handles status misaligned. Usage of this macro must be limited to cases mentioned above.

__HAL_ADC_CHANNEL_DIFF_NEG_INPUT

Description:

- Helper macro to determine the selected channel corresponding negative input on the ADC instance selected.

Parameters:

- __HANDLE__: ADC handle.
- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_19
  - ADC_CHANNEL_VREFINT (1)(4)
  - ADC_CHANNEL_VBAT (2)(4)
  - ADC_CHANNEL_VDDCORE (2)(4)

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15

ADC Extended Offset Sign

ADC_OFFSET_SIGN_NEGATIVE

Offset sign negative, offset is subtracted

ADC_OFFSET_SIGN_POSITIVE

Offset sign positive, offset is added

9 HAL BSEC Generic Driver

9.1 BSEC Firmware driver registers structures

9.1.1 BSEC_HandleTypeDef

BSEC_HandleTypeDef is defined in the stm32n6xx_hal_bsec.h

Data Fields

- ***BSEC_TypeDef * Instance***
- ***uint32_t ErrorCode***

Field Documentation

- ***BSEC_TypeDef* BSEC_HandleTypeDef::Instance***
  BSEC registers base address
- ***uint32_t BSEC_HandleTypeDef::ErrorCode***
  Error code in case of HAL driver internal error

9.1.2 BSEC_ScratchRegTypeDef

BSEC_ScratchRegTypeDef is defined in the stm32n6xx_hal_bsec.h

Data Fields

- ***uint32_t RegType***
- ***uint32_t RegNumber***

Field Documentation

- ***uint32_t BSEC_ScratchRegTypeDef::RegType***
  Type of the register This parameter can be a value of ***BSEC_Register_Type***
- ***uint32_t BSEC_ScratchRegTypeDef::RegNumber***
  Number of the register This parameter can be a value between 0 and 3 if RegType is HAL_BSEC_SCRATCH_REG and between 0 and 7 if RegType is HAL_BSEC_WRITE_ONCE_SCRATCH_REG

9.1.3 BSEC_DebugCfgTypeDef

BSEC_DebugCfgTypeDef is defined in the stm32n6xx_hal_bsec.h

Data Fields

- ***uint32_t HDPL_Open_Dbg***
- ***uint32_t Sec_Dbg_Auth***
- ***uint32_t NonSec_Dbg_Auth***

Field Documentation

- ***uint32_t BSEC_DebugCfgTypeDef::HDPL_Open_Dbg***
  Level at which debug may be opened This parameter can be a value of ***BSEC_Open_Dbg***
- ***uint32_t BSEC_DebugCfgTypeDef::Sec_Dbg_Auth***
  Secure debug authorization This parameter can be a value of ***BSEC_Sec_Dbg_Auth***
- ***uint32_t BSEC_DebugCfgTypeDef::NonSec_Dbg_Auth***
  Non-secure debug authorization This parameter can be a value of ***BSEC_NonSec_Dbg_Auth***

9.2 BSEC Firmware driver API description

The following section lists the various functions of the BSEC library.

9.2.1 How to use this driver

General Configuration

- Call the function HAL_BSEC_GetStatus() to get the status of BSEC peripheral.

- Call the function HAL_BSEC_GlobalLock() to lock the write to BSEC registers.
- Call the function HAL_BSEC_GetGlobalLockStatus() to get the global write registers lock status.
- Call the function HAL_BSEC_GetErrorCode() to get the error code raised when API return HAL_ERROR.

OTP Management

- Call the function HAL_BSEC_OTP_Read() to read the value of an OTP fuse.
- Call the function HAL_BSEC_OTP_Program() to program an OTP fuse with or without permanent lock.
- Call the function HAL_BSEC_OTP_Reload() to reload an OTP fuse value.
- Call the function HAL_BSEC_OTP_Lock() to sticky lock an OTP fuse programming, writing shadowed register or reload.
- Call the function HAL_BSEC_OTP_GetState() to get the sticky lock status (programming, writing shadowed register or reload), the permanent lock status, the shadow configuration, the ECC or hidden status of an OTP fuse.

Shadow fuse register management

- Call the function HAL_BSEC_OTP_ReadShadow() to read the value of a shadow fuse register.
- Call the function HAL_BSEC_OTP_WriteShadow() to write in a shadow fuse register.
- Call the function HAL_BSEC_OTP_GetShadowState() to get the validity status of a shadow fuse register.

Device lifecycle management

- Call the function HAL_BSEC_GetDeviceLifeCycleState() to get the BSEC device lifecycle state.
- Call the function HAL_BSEC_ReadEpochCounter() to read the value of epoch counter.
- Call the function HAL_BSEC_SelectEpochCounter() to select the epoch counter used by SAES.
- Call the function HAL_BSEC_GetEpochCounterSelection() to get the epoch counter selection for SAES.

HDPL management

- Call the function HAL_BSEC_GetHDPLValue() to get the current HDPL.
- Call the function HAL_BSEC_IncrementHDPLValue() to increment the HDPL.
- Call the function HAL_BSEC_ConfigSAESHDPLIncrementValue() to configure the increment of HDPL sent to SAES.
- Call the function HAL_BSEC_GetSAESHDPLIncrementValue() to get the SAES increment to HDPL.

Scratch register management

- Call the function HAL_BSEC_WriteScratchValue() to write a value in write once scratch or scratch register.
- Call the function HAL_BSEC_ReadScratchValue() to read a value from write once scratch or scratch register.

Debug management

- Call the function HAL_BSEC_GetDebugRequest() to get the debug request of host debugger.
- Call the function HAL_BSEC_SendJTAGData() to send data via JTAG.
- Call the function HAL_BSEC_ReceiveJTAGData() to receive data via JTAG.
- Call the function HAL_BSEC_ConfigDebug() to configure the HDPL, secure and non-secure authorization for debugger.
- Call the function HAL_BSEC_GetDebugConfig() to get the HDPL, secure and non-secure authorization of debug.
- Call the function HAL_BSEC_LockDebug() to lock the debug.
- Call the function HAL_BSEC_UnlockDebug() to unlock the debug.
- Call the function HAL_BSEC_GetDebugLockState() to get the debug lock status.

DHUK management

- Call the function HAL_BSEC_GetDHUKValidity() to get the validity of DHUK.
- Call the function HAL_BSEC_LockDHUKUse() to lock the DHUK use.

- Call the function HAL_BSEC_GetDHUKLockStatus() to get the DHUK lock status.

Reset counter

- Call the function HAL_BSEC_GetNumberOfResets() to get the number of hot or warm resets.

9.2.2 Detailed description of functions

HAL_BSEC_GetStatus

Function name

HAL_StatusTypeDef HAL_BSEC_GetStatus (BSEC_HandleTypeDef * hbsec, uint32_t * pStatus)

Function description

HAL_BSEC_GlobalLock

Function name

HAL_StatusTypeDef HAL_BSEC_GlobalLock (BSEC_HandleTypeDef * hbsec)

Function description

HAL_BSEC_GetGlobalLockStatus

Function name

HAL_StatusTypeDef HAL_BSEC_GetGlobalLockStatus (BSEC_HandleTypeDef * hbsec, uint32_t * pStatus)

Function description

HAL_BSEC_GetErrorCode

Function name

HAL_StatusTypeDef HAL_BSEC_GetErrorCode (BSEC_HandleTypeDef * hbsec, uint32_t * pError)

Function description

HAL_BSEC_OTP_Read

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_Read (BSEC_HandleTypeDef * hbsec, uint32_t FuseId, uint32_t * pFuseData)

Function description

HAL_BSEC_OTP_Program

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_Program (BSEC_HandleTypeDef * hbsec, uint32_t FuseId, uint32_t FuseData, uint32_t Lock)

Function description

HAL_BSEC_OTP_Reload

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_Reload (BSEC_HandleTypeDef * hbsec, uint32_t FuseId)

Function description

HAL_BSEC_OTP_Lock

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_Lock (BSEC_HandleTypeDef * hbsec, uint32_t FuseId, uint32_t Lock)

Function description

HAL_BSEC_OTP_GetState

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_GetState (BSEC_HandleTypeDef * hbsec, uint32_t FuseId, uint32_t * pState)

Function description

HAL_BSEC_OTP_ReadShadow

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_ReadShadow (BSEC_HandleTypeDef * hbsec, uint32_t RegId, uint32_t * pRegData)

Function description

HAL_BSEC_OTP_WriteShadow

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_WriteShadow (BSEC_HandleTypeDef * hbsec, uint32_t RegId, uint32_t RegData)

Function description

HAL_BSEC_OTP_GetShadowState

Function name

HAL_StatusTypeDef HAL_BSEC_OTP_GetShadowState (BSEC_HandleTypeDef * hbsec, uint32_t RegId, uint32_t * pValidity)

Function description

HAL_BSEC_GetDeviceLifeCycleState

Function name

HAL_StatusTypeDef HAL_BSEC_GetDeviceLifeCycleState (BSEC_HandleTypeDef * hbsec, uint32_t * pState)

Function description

HAL_BSEC_ReadEpochCounter

Function name

HAL_StatusTypeDef HAL_BSEC_ReadEpochCounter (BSEC_HandleTypeDef * hbsec, uint32_t CounterId, uint32_t * pCounterData)

Function description

HAL_BSEC_SelectEpochCounter

Function name

HAL_StatusTypeDef HAL_BSEC_SelectEpochCounter (BSEC_HandleTypeDef * hbsec, uint32_t SelectedCounter)

Function description

HAL_BSEC_GetEpochCounterSelection

Function name

HAL_StatusTypeDef HAL_BSEC_GetEpochCounterSelection (BSEC_HandleTypeDef * hbsec, uint32_t * pSelectedCounter)

Function description

HAL_BSEC_GetHDPLValue

Function name

HAL_StatusTypeDef HAL_BSEC_GetHDPLValue (BSEC_HandleTypeDef * hbsec, uint32_t * pHDPL)

Function description

HAL_BSEC_IncrementHDPLValue

Function name

HAL_StatusTypeDef HAL_BSEC_IncrementHDPLValue (BSEC_HandleTypeDef * hbsec)

Function description

HAL_BSEC_ConfigSAESHDPLIncrementValue

Function name

HAL_StatusTypeDef HAL_BSEC_ConfigSAESHDPLIncrementValue (BSEC_HandleTypeDef * hbsec, uint32_t Increment)

Function description

HAL_BSEC_GetSAESHDPLIncrementValue

Function name

HAL_StatusTypeDef HAL_BSEC_GetSAESHDPLIncrementValue (BSEC_HandleTypeDef * hbsec, uint32_t * pIncrement)

Function description

HAL_BSEC_WriteScratchValue

Function name

HAL_StatusTypeDef HAL_BSEC_WriteScratchValue (BSEC_HandleTypeDef * hbsec, const BSEC_ScratchRegTypeDef * pRegAddr, uint32_t Value)

Function description

HAL_BSEC_ReadScratchValue

Function name

HAL_StatusTypeDef HAL_BSEC_ReadScratchValue (BSEC_HandleTypeDef * hbsec, const BSEC_ScratchRegTypeDef * pRegAddr, uint32_t * pValue)

Function description

HAL_BSEC_GetDebugRequest

Function name

HAL_StatusTypeDef HAL_BSEC_GetDebugRequest (BSEC_HandleTypeDef * hbsec, uint32_t * pDbgReq)

Function description

HAL_BSEC_SendJTAGData

Function name

HAL_StatusTypeDef HAL_BSEC_SendJTAGData (BSEC_HandleTypeDef * hbsec, uint32_t Data)

Function description

HAL_BSEC_ReceiveJTAGData

Function name

HAL_StatusTypeDef HAL_BSEC_ReceiveJTAGData (BSEC_HandleTypeDef * hbsec, uint32_t * pData)

Function description

HAL_BSEC_ConfigDebug

Function name

HAL_StatusTypeDef HAL_BSEC_ConfigDebug (BSEC_HandleTypeDef * hbsec, const BSEC_DebugCfgTypeDef * pCfg)

Function description

HAL_BSEC_GetDebugConfig

Function name

HAL_StatusTypeDef HAL_BSEC_GetDebugConfig (BSEC_HandleTypeDef * hbsec, BSEC_DebugCfgTypeDef * pDbgCfg)

Function description

HAL_BSEC_LockDebug

Function name

HAL_StatusTypeDef HAL_BSEC_LockDebug (BSEC_HandleTypeDef * hbsec)

Function description

HAL_BSEC_UnlockDebug

Function name

HAL_StatusTypeDef HAL_BSEC_UnlockDebug (BSEC_HandleTypeDef * hbsec)

Function description

HAL_BSEC_GetDebugLockState

Function name

HAL_StatusTypeDef HAL_BSEC_GetDebugLockState (BSEC_HandleTypeDef * hbsec, uint32_t * pStatus)

Function description

HAL_BSEC_GetDHUKValidity

Function name

HAL_StatusTypeDef HAL_BSEC_GetDHUKValidity (BSEC_HandleTypeDef * hbsec, uint32_t * pValidity)

Function description

HAL_BSEC_LockDHUKUse

Function name

HAL_StatusTypeDef HAL_BSEC_LockDHUKUse (BSEC_HandleTypeDef * hbsec)

Function description

HAL_BSEC_GetDHUKLockStatus

Function name

HAL_StatusTypeDef HAL_BSEC_GetDHUKLockStatus (BSEC_HandleTypeDef * hbsec, uint32_t * pStatus)

Function description

HAL_BSEC_GetNumberOfResets

Function name

HAL_StatusTypeDef HAL_BSEC_GetNumberOfResets (BSEC_HandleTypeDef * hbsec, uint32_t ResetType, uint32_t * pResetNumber)

Function description

9.3 BSEC Firmware driver defines

The following section lists the various define and macros of the module.

9.3.1 BSEC

BSEC

BSEC Debug lock

HAL_BSEC_DEBUG_LOCKED

DBG_MCU AP interface locked

HAL_BSEC_DEBUG_UNLOCKED

DBG_MCU AP interface unlocked

BSEC Debug request

HAL_BSEC_DBG_NOT_REQUESTED

Host debugger is not requesting debug

HAL_BSEC_DBG_REQUESTED

Host debugger is requesting debug

BSEC Derived hardware unique key lock

HAL_BSEC_DHUK_USABLE

DHUK in SAES is usable

HAL_BSEC_DHUK_NOT_USABLE

DHUK in SAES is not usable

BSEC Derived hardware unique key validity

HAL_BSEC_DHUK_INVALID

DHUK can't be used in SAES

HAL_BSEC_DHUK_VALID

DHUK can be used in SAES

BSEC Epoch selected register

HAL_BSEC_EPOCH_COUNTER_0

Epoch counter 0

HAL_BSEC_EPOCH_COUNTER_1

Epoch counter 1

BSEC Error code

HAL_BSEC_ERROR_NONE

No error

HAL_BSEC_ERROR_INVALID_PARAM

Parameter error

HAL_BSEC_ERROR_UNDEFINED_VALUE

Undefined value error

HAL_BSEC_ERROR_LOCK

Locked operation error

HAL_BSEC_ERROR_UNALLOWED

Not possible operation error

HAL_BSEC_ERROR_TIMEOUT

Timeout error

HAL_BSEC_ERROR_PROGFAIL

Programming failed

HAL_BSEC_ERROR_DISTURB

Disturb flag (unexpected error)

HAL_BSEC_ERROR_DED

Double error detection flag

HAL_BSEC_ERROR_SEC

Single error detection flag

HAL_BSEC_ERROR_PPL

Permanent programming lock flag

HAL_BSEC_ERROR_PPLM

Permanent programming lock mismatch flag

HAL_BSEC_ERROR_AME

Addresses mismatch error flag

BSEC Global write lock

HAL_BSEC_WRITE_REG_ALLOWED

Write to BSEC registers are allowed

HAL_BSEC_WRITE_REG_IGNORED

Write to BSEC registers are ignored

BSEC Hide protection level

HAL_BSEC_HDPL_VALUE_0

Level 0

HAL_BSEC_HDPL_VALUE_1

Level 1

HAL_BSEC_HDPL_VALUE_2

Level 2

HAL_BSEC_HDPL_VALUE_3

Level 3

BSEC Increment of Hide protection level sent to SAES

HAL_BSEC_HDPL_INCR_VALUE_0

HDPL sent to SAES incremented by 0

HAL_BSEC_HDPL_INCR_VALUE_1

HDPL sent to SAES incremented by 1

HAL_BSEC_HDPL_INCR_VALUE_2

HDPL sent to SAES incremented by 2

HAL_BSEC_HDPL_INCR_VALUE_3

HDPL sent to SAES incremented by 3

BSEC Device lifecycle state

HAL_BSEC_OPEN_STATE

BSEC is in open state

HAL_BSEC_CLOSED_STATE

BSEC is in closed state

HAL_BSEC_INVALID_STATE

BSEC is in invalid state

HAL_BSEC_INVALID_STATE_WITH_TAMPER

BSEC is in invalid state with an active confirmed tamper triggered

BSEC Non-secure debug authorization

HAL_BSEC_NONSEC_DBG_UNAUTH

Non-secure debug not authorized

HAL_BSEC_NONSEC_DBG_AUTH

Non-secure debug authorized

BSEC Open debug level

HAL_BSEC_OPEN_DBG_LEVEL_0

Debug opened for HDPL0

HAL_BSEC_OPEN_DBG_LEVEL_1

Debug opened for HDPL1

HAL_BSEC_OPEN_DBG_LEVEL_2

Debug opened for HDPL2

HAL_BSEC_OPEN_DBG_LEVEL_3

Debug opened for HDPL3

BSEC Permanent lock

HAL_BSEC_NORMAL_PROG

Fuse word is programmed normally

HAL_BSEC_LOCK_PROG

Fuse word is locked, preventing further modifications

BSEC Type of scratch register

HAL_BSEC_SCRATCH_REG

Type of register is scratch register

HAL_BSEC_WRITE_ONCE_SCRATCH_REG

Type of register is write once scratch register

BSEC Validity of shadow register reload

HAL_BSEC_RELOAD_ERROR

An error occurred while fuse word was last reloaded

HAL_BSEC_RELOAD_DONE

Last reload of fuse word was done without error

BSEC Type of reset

HAL_BSEC_HOT_RESET

Type of reset is hot reset

HAL_BSEC_WARM_RESET

Type of reset is warm reset

BSEC Secure debug authorization

HAL_BSEC_SEC_DBG_UNAUTH

Secure debug not authorized

HAL_BSEC_SEC_DBG_AUTH

Secure debug authorized

BSEC State

HAL_BSEC_FUSE_PROG_LOCKED

Fuse word programming is silently ignored until next reset

HAL_BSEC_FUSE_WRITE_LOCKED

Shadow register writing is silently ignored until next reset

HAL_BSEC_FUSE_RELOAD_LOCKED

Fuse word loading is denied until next reset

HAL_BSEC_FUSE_LOCKED

Fuse word is locked, preventing further modifications

HAL_BSEC_FUSE_SHADOWED

Fuse word is shadowed

HAL_BSEC_FUSE_HIDDEN

Fuse word is hidden

HAL_BSEC_FUSE_ERROR_DETECTED

At least one error is detected during reset operations

HAL_BSEC_FUSE_ERROR_CORRECTED

At least one single-error correction is detected during reset operations

BSEC Peripheral status

HAL_BSEC_INIT_DONE

BSEC initialized following a cold or warm reset

HAL_BSEC_UPPER_FUSES_HIDDEN

Upper fuses are not accessible to the application

HAL_BSEC_OTP_NOT_VIRGIN

BSEC is not virgin

10 HAL CACHEAXI Generic Driver

10.1 CACHEAXI Firmware driver registers structures

10.1.1 __CACHEAXI_HandleTypeDef

__CACHEAXI_HandleTypeDef is defined in the stm32n6xx_hal_cacheaxi.h

Data Fields

- ***CACHEAXI_TypeDef * Instance***
- ***__IO HAL_CACHEAXI_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* ErrorCallback***
- ***void(* CleanByAddrCallback***
- ***void(* InvalidateCompleteCallback***
- ***void(* CleanAndInvalidateByAddrCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***CACHEAXI_TypeDef* __CACHEAXI_HandleTypeDef::Instance***
  CACHEAXI register base address.
- ***__IO HAL_CACHEAXI_StateTypeDef __CACHEAXI_HandleTypeDef::State***
- ***__IO uint32_t __CACHEAXI_HandleTypeDef::ErrorCode***
- ***void(* __CACHEAXI_HandleTypeDef::ErrorCallback)(struct __CACHEAXI_HandleTypeDef *hcacheaxi)***
- ***void(* __CACHEAXI_HandleTypeDef::CleanByAddrCallback)(struct __CACHEAXI_HandleTypeDef *hcacheaxi)***
- ***void(* __CACHEAXI_HandleTypeDef::InvalidateCompleteCallback)(struct __CACHEAXI_HandleTypeDef *hcacheaxi)***
- ***void(* __CACHEAXI_HandleTypeDef::CleanAndInvalidateByAddrCallback)(struct __CACHEAXI_HandleTypeDef *hcacheaxi)***
- ***void(* __CACHEAXI_HandleTypeDef::MspInitCallback)(struct __CACHEAXI_HandleTypeDef *hcacheaxi)***
- ***void(* __CACHEAXI_HandleTypeDef::MspDeInitCallback)(struct __CACHEAXI_HandleTypeDef *hcacheaxi)***

10.2 CACHEAXI Firmware driver API description

The following section lists the various functions of the CACHEAXI library.

10.2.1 How to use this driver

1. Configure and enable the MPU to override default config if needed, please refers to ARM manual for default memory attribute. Then enable CACHEAXI with HAL_CACHEAXI_Init() to cache memories data when accessed by a master peripheral through an AXI interconnect.

- Use HAL_CACHEAXI_Invalidate() to invalidate the full cache content:
  - Cache content is lost, and reloaded when needed.
  - Blocking call until operation is done.
- Use HAL_CACHEAXI_CleanByAddr() to clean cache content for a specific memory range:
  - Cache content for specific range is written back to specific memory range.
  - Used when buffer is updated by CPU before usage by a peripheral (typically DMA transfer)
  - Blocking call until operation is done.

- Use HAL_CACHEAXI_CleanInvalidateByAddr() to clean and invalidate cache content for a specific memory range:
  - Cache content for specific range is written back to specific memory range, and reloaded when needed.
  - Recommended to use for MPU reprogramming.
  - Blocking call until operation is done.

Interrupt mode IO operation

- Configure the CACHEAXI interrupt priority using HAL_NVIC_SetPriority()
- Enable the CACHEAXI IRQ handler using HAL_NVIC_EnableIRQ()
- Override weak definition for following callbacks (if needed):
  - HAL_CACHEAXI_CleanAndInvalidateByAddrCallback()
  - HAL_CACHEAXI_InvalidateCompleteCallback()
  - HAL_CACHEAXI_CleanByAddrCallback()
  - HAL_CACHEAXI_ErrorCallback()
- Use HAL_CACHEAXI_<COMMAND>_IT() to start a CACHEAXI operation with IT enabled.
- Use HAL_CACHEAXI_IRQHandler() called under CACHEAXIx_IRQHandler() Interrupt subroutine

Use HAL_CACHEAXI_GetState() function to return the CACHEAXI state and HAL_CACHEAXI_GetError() in case of error detection.

CACHEAXI HAL driver macros list

Below the list of macros defined in the CACHEAXI HAL driver.

- __HAL_CACHEAXI_ENABLE_IT : Enable CACHEAXI interrupts.
- __HAL_CACHEAXI_DISABLE_IT : Disable CACHEAXI interrupts.
- __HAL_CACHEAXI_GET_IT_SOURCE: Check whether the specified CACHEAXI interrupt source is enabled or not.
- __HAL_CACHEAXI_GET_FLAG : Check whether the selected CACHEAXI flag is set or not.
- __HAL_CACHEAXI_CLEAR_FLAG : Clear the selected CACHEAXI flags.

Note: You can refer to the header file of the CACHEAXI HAL driver for more useful macros.

10.2.2 Detailed description of functions

HAL_CACHEAXI_Init

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Init (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_DeInit

Function name

HAL_StatusTypeDef HAL_CACHEAXI_DeInit (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_MspInit

Function name

void HAL_CACHEAXI_MspInit (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_MspDeInit

Function name

void HAL_CACHEAXI_MspDeInit (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Enable

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Enable (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Disable

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Disable (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_IsEnabled

Function name

uint32_t HAL_CACHEAXI_IsEnabled (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Invalidate

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Invalidate (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_CleanByAddr

Function name

HAL_StatusTypeDef HAL_CACHEAXI_CleanByAddr (CACHEAXI_HandleTypeDef * hcacheaxi, const uint32_t *const pAddr, uint32_t dSize)

Function description

HAL_CACHEAXI_CleanInvalidByAddr

Function name

HAL_StatusTypeDef HAL_CACHEAXI_CleanInvalidByAddr (CACHEAXI_HandleTypeDef * hcacheaxi, const uint32_t *const pAddr, uint32_t dSize)

Function description

HAL_CACHEAXI_Invalidate_IT

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Invalidate_IT (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_CleanByAddr_IT

Function name

HAL_StatusTypeDef HAL_CACHEAXI_CleanByAddr_IT (CACHEAXI_HandleTypeDef * hcacheaxi, const uint32_t *const pAddr, uint32_t dSize)

Function description

HAL_CACHEAXI_CleanInvalidByAddr_IT

Function name

HAL_StatusTypeDef HAL_CACHEAXI_CleanInvalidByAddr_IT (CACHEAXI_HandleTypeDef * hcacheaxi, const uint32_t *const pAddr, uint32_t dSize)

Function description

HAL_CACHEAXI_IRQHandler

Function name

void HAL_CACHEAXI_IRQHandler (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_ErrorCallback

Function name

void HAL_CACHEAXI_ErrorCallback (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_CleanByAddrCallback

Function name

void HAL_CACHEAXI_CleanByAddrCallback (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_InvalidateCompleteCallback

Function name

void HAL_CACHEAXI_InvalidateCompleteCallback (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_CleanAndInvalidateByAddrCallback

Function name

void HAL_CACHEAXI_CleanAndInvalidateByAddrCallback (CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CACHEAXI_RegisterCallback (CACHEAXI_HandleTypeDef * hcacheaxi, HAL_CACHEAXI_CallbackIDTypeDef CallbackID, pCACHEAXI_CallbackTypeDef pCallback)

Function description

HAL_CACHEAXI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CACHEAXI_UnRegisterCallback (CACHEAXI_HandleTypeDef * hcacheaxi, HAL_CACHEAXI_CallbackIDTypeDef CallbackID)

Function description

HAL_CACHEAXI_Monitor_GetReadHitValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetReadHitValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_GetReadMissValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetReadMissValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_GetWriteHitValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetWriteHitValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_GetWriteMissValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetWriteMissValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_GetReadAllocMissValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetReadAllocMissValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_GetWriteAllocMissValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetWriteAllocMissValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_GetWriteThroughValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetWriteThroughValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_GetEvictionValue

Function name

uint32_t HAL_CACHEAXI_Monitor_GetEvictionValue (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_Monitor_Reset

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Monitor_Reset (CACHEAXI_HandleTypeDef * hcacheaxi, uint32_t MonitorType)

Function description

HAL_CACHEAXI_Monitor_Start

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Monitor_Start (CACHEAXI_HandleTypeDef * hcacheaxi, uint32_t MonitorType)

Function description

Function name

HAL_StatusTypeDef HAL_CACHEAXI_Monitor_Stop (CACHEAXI_HandleTypeDef * hcacheaxi, uint32_t MonitorType)

Function description

HAL_CACHEAXI_GetState

Function name

HAL_CACHEAXI_StateTypeDef HAL_CACHEAXI_GetState (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

HAL_CACHEAXI_GetError

Function name

uint32_t HAL_CACHEAXI_GetError (const CACHEAXI_HandleTypeDef * hcacheaxi)

Function description

10.3 CACHEAXI Firmware driver defines

The following section lists the various define and macros of the module.

10.3.1 CACHEAXI

CACHEAXI

Command Operation

LL_CACHEAXI_COMMAND_NO_OPERATION

LL_CACHEAXI_COMMAND_CLEAN_BY_ADDR

LL_CACHEAXI_COMMAND_CLEAN_INVALIDATE_BY_ADDR

CACHEAXI Error Code

HAL_CACHEAXI_ERROR_NONE

No error

HAL_CACHEAXI_ERROR_TIMEOUT

Timeout error

HAL_CACHEAXI_ERROR_EVICTION_CLEAN

Eviction or clean operation write-back error

HAL_CACHEAXI_ERROR_INVALID_OPERATION

Invalid operation

HAL_CACHEAXI_ERROR_INVALID_CALLBACK

Invalid callback error

CACHEAXI Exported Macros

__HAL_CACHEAXI_ENABLE_IT

Description:

- Enable CACHEAXI interrupts.

Parameters:

- __HANDLE__: specifies the CACHEAXI handle.
- __INTERRUPT__: specifies the CACHEAXI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - CACHEAXI_IT_BUSYEND Busy end interrupt
  - CACHEAXI_IT_ERROR Cache error interrupt
  - CACHEAXI_IT_CMDEND Cache Command end interrupt

Return value:

- None

__HAL_CACHEAXI_DISABLE_IT

Description:

- Disable CACHEAXI interrupts.

Parameters:

- __HANDLE__: specifies the CACHEAXI handle.
- __INTERRUPT__: specifies the CACHEAXI interrupt sources to be disabled. This parameter can be any combination of the following values:
  - CACHEAXI_IT_BUSYEND Busy end interrupt
  - CACHEAXI_IT_ERROR Cache error interrupt
  - CACHEAXI_IT_CMDEND Cache Command end interrupt

Return value:

- None

__HAL_CACHEAXI_GET_IT_SOURCE

Description:

- Check whether the specified CACHEAXI interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the CACHEAXI handle.
- __INTERRUPT__: specifies the CACHEAXI interrupt source to check. This parameter can be any combination of the following values:
  - CACHEAXI_IT_BUSYEND Busy end interrupt
  - CACHEAXI_IT_ERROR Cache error interrupt
  - CACHEAXI_IT_CMDEND Cache Command end interrupt

Return value:

- The: state of __INTERRUPT__ (SET or RESET).

__HAL_CACHEAXI_GET_FLAG

Description:

- Check whether the selected CACHEAXI flag is set or not.

Parameters:

- __HANDLE__: specifies the CACHEAXI handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - CACHEAXI_FLAG_BUSY Busy flag
  - CACHEAXI_FLAG_BUSYEND Busy end flag
  - CACHEAXI_FLAG_ERROR Cache error flag
  - CACHEAXI_FLAG_BUSYCMD Cache Busy command flag
  - CACHEAXI_FLAG_CMDEND Cache command end flag

Return value:

- The: state of __FLAG__ (0 or 1).

__HAL_CACHEAXI_CLEAR_FLAG

Description:

- Clear the selected CACHEAXI flags.

Parameters:

- __HANDLE__: specifies the CACHEAXI handle.
- __FLAG__: specifies the CACHEAXI flags to clear. This parameter can be any combination of the following values:
  - CACHEAXI_FLAG_BUSYEND Busy end flag
  - CACHEAXI_FLAG_ERROR Cache error flag
  - CACHEAXI_FLAG_CMDEND Cache command end flag

Flags

CACHEAXI_FLAG_BUSY

Busy flag

CACHEAXI_FLAG_BUSYEND

Busy end flag

CACHEAXI_FLAG_ERROR

Cache error flag

CACHEAXI_FLAG_BUSYCMD

Busy command flag

CACHEAXI_FLAG_CMDEND

Command end flag

Interrupts

CACHEAXI_IT_BUSYEND

Busy end interrupt

CACHEAXI_IT_ERROR

Cache error interrupt

11 HAL CORTEX Generic Driver

11.1 CORTEX Firmware driver registers structures

11.1.1 MPU_Region_InitTypeDef

MPU_Region_InitTypeDef is defined in the stm32n6xx_hal_cortex.h

Data Fields

- ***uint8_t Enable***
- ***uint8_t Number***
- ***uint32_t BaseAddress***
- ***uint32_t LimitAddress***
- ***uint8_t AttributesIndex***
- ***uint8_t AccessPermission***
- ***uint8_t DisableExec***
- ***uint8_t DisablePrivExec***
- ***uint8_t IsShareable***

Field Documentation

- ***uint8_t MPU_Region_InitTypeDef::Enable***
  Specifies the status of the region. This parameter can be a value of ***CORTEX_MPU_Region_Enable***
- ***uint8_t MPU_Region_InitTypeDef::Number***
  Specifies the number of the region to protect. This parameter can be a value of ***CORTEX_MPU_Region_Number***
- ***uint32_t MPU_Region_InitTypeDef::BaseAddress***
  Specifies the base address of the region to protect.
- ***uint32_t MPU_Region_InitTypeDef::LimitAddress***
  Specifies the limit address of the region to protect.
- ***uint8_t MPU_Region_InitTypeDef::AttributesIndex***
  Specifies the memory attributes index. This parameter can be a value of ***CORTEX_MPU_Attributes_Number***
- ***uint8_t MPU_Region_InitTypeDef::AccessPermission***
  Specifies the region access permission type. This parameter can be a value of ***CORTEX_MPU_Region_Permission_Attributes***
- ***uint8_t MPU_Region_InitTypeDef::DisableExec***
  Specifies the instruction access status. This parameter can be a value of ***CORTEX_MPU_Instruction_Access***
- ***uint8_t MPU_Region_InitTypeDef::DisablePrivExec***
  Specifies if privileged software can execute instructions from this region. This parameter can be a value of ***CORTEX_MPU_Priv_Instruction_Access***
- ***uint8_t MPU_Region_InitTypeDef::IsShareable***
  Specifies the shareability status of the protected region. This parameter can be a value of ***CORTEX_MPU_Access_Shareable***

11.1.2 MPU_Attributes_InitTypeDef

MPU_Attributes_InitTypeDef is defined in the stm32n6xx_hal_cortex.h

Data Fields

- ***uint8_t Number***
- ***uint8_t Attributes***

Field Documentation

- ***uint8_t MPU_Attributes_InitTypeDef::Number***
  Specifies the number of the memory attributes to configure. This parameter can be a value of ***CORTEX_MPU_Attributes_Number***

- ***uint8_t MPU_Attributes_InitTypeDef::Attributes***
  Specifies the memory attributes vue. This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xFFFF

11.2 CORTEX Firmware driver API description

The following section lists the various functions of the CORTEX library.

11.2.1 How to use this driver

How to configure Interrupts using CORTEX HAL driver

This section provides functions allowing to configure the NVIC interrupts (IRQ). The Cortex-M55 exceptions are managed by CMSIS functions.

1. Configure the NVIC Priority Grouping using HAL_NVIC_SetPriorityGrouping() function.
2. Configure the priority of the selected IRQ Channels using HAL_NVIC_SetPriority().
3. Enable the selected IRQ Channels using HAL_NVIC_EnableIRQ().

Note: When the NVIC_PRIORITYGROUP_0 is selected, IRQ pre-emption is no more possible. The pending IRQ priority will be managed only by the sub priority.

Note: IRQ priority order (sorted by highest to lowest priority):

- *Lowest pre-emption priority*
- *Lowest sub priority*
- *Lowest hardware priority (IRQ number)*

How to configure SysTick using CORTEX HAL driver

Setup SysTick Timer for time base.

- The HAL_SYSTICK_Config() function calls the SysTick_Config() function which is a CMSIS function that:
  - Configures the SysTick Reload register with value passed as function parameter.
  - Configures the SysTick IRQ priority to the lowest value (0x0F).
  - Resets the SysTick Counter register.
  - Configures the SysTick Counter clock source to be Core Clock Source (HCLK).
  - Enables the SysTick Interrupt.
  - Starts the SysTick Counter.
- You can change the SysTick Clock source to be HCLK_Div8 by calling the macro __HAL_CORTEX_SYSTICKCLK_CONFIG(SYSTICK_CLKSOURCE_HCLK_DIV8) just after the HAL_SYSTICK_Config() function call. The __HAL_CORTEX_SYSTICKCLK_CONFIG() macro is defined inside the stm32n6xx_hal_cortex.h file.
- You can change the SysTick IRQ priority by calling the HAL_NVIC_SetPriority(SysTick_IRQn,...) function just after the HAL_SYSTICK_Config() function call. The HAL_NVIC_SetPriority() call the NVIC_SetPriority() function which is a CMSIS function.
- To adjust the SysTick time base, use the following formula: Reload Value = SysTick Counter Clock (Hz) x Desired Time base (s)
  - Reload Value is the parameter to be passed for HAL_SYSTICK_Config() function
  - Reload Value should not exceed 0xFFFFFF

How to configure MPU (secure and non secure) using CORTEX HAL driver

This section provides functions allowing to configure both secure and non-secure MPUs.

1. Enable the MPU using HAL_MPU_Enable() function.
2. Disable the MPU using HAL_MPU_Disable() function.
3. Enable the MPU using HAL_MPU_Enable_NS() function to address the non secure MPU.
4. Disable the MPU using HAL_MPU_Disable_NS() function to address the non secure MPU.
5. Configure the MPU region using HAL_MPU_ConfigRegion() and HAL_MPU_ConfigRegion_NS() to address the non secure MPU.

6. Configure the MPU Memory attributes using HAL_MPU_ConfigMemoryAttributes() and HAL_MPU_ConfigMemoryAttributes_NS() to address the non secure MPU. A device memory has the following attributes:
7. G or nG: gathering or non-gathering. (multiple accesses to a device can be merged into a single transaction except for operations with memory ordering semantics, for example, memory barrier instructions, load acquire/store release).
8. R or nR: reordering
9. E or nE: early write acknowledge (similar to bufferable) Only four combinations of these attributes are valid:
10. device-nGnRnE: equivalent to Armv7-M strongly ordered memory type
11. device-nGnRE: equivalent to Armv7-M device memory
12. device-nGRE: new to Armv8-M
13. device-GRE: new to Armv8-M A normal memory has the following attributes:
14. Cache Allocation attribute : set when a cache line is allocated (no allocation, read/write/read-write allocation)
15. Cache write policy : write through (write to cache AND memory), write back (memory is written when the cache line is evicted)
16. Transient : indicates that the region will be used for a short period of time For normal memory, attributes can be set for inner and outer caches separately. Note that outer attributes set to 0 change the memory to device mode. Both inner and outer attributes should be set for normal memory. Sample configurations
17. Inner-outer cacheable, write back, read-write allocate INNER_OUTER(MPU_RW_ALLOCATE | MPU_WRITE_BACK)
18. Inner write back, read allocation, outer non-cacheable (MPU_R_ALLOCATE | MPU_WRITE_BACK) | OUTER(MPU_NOT_CACHEABLE) For detail on memory attributes, refer to the ARMv8-m MPU documentation. On STM32N6xx, the MPUs are split memory into regions (up to sixteen for both Secure and Non-Secure domains) The secure MPU is only available when TrustZone is activated.
19. Enable the MPU using HAL_MPU_Enable() function or HAL_MPU_Enable_NS function for non-secure MPU.
20. Disable the MPU using HAL_MPU_Disable() function or HAL_MPU_Disable_NS function for non-secure MPU.
21. Enable the MPU region using HAL_MPU_EnableRegion() function or HAL_MPU_EnableRegion_NS function for non-secure MPU region.
22. Disable the MPU region using HAL_MPU_DisableRegion() function or HAL_MPU_DisableRegion_NS function for non-secure MPU region.
23. Configure the MPU region using HAL_MPU_ConfigRegion() function or HAL_MPU_ConfigRegion_NS function for non-secure MPU.
24. Configure the MPU memory attributes using HAL_MPU_ConfigMemoryAttributes() function or HAL_MPU_ConfigMemoryAttributes_NS function for non-secure MPU.
25. The HAL_MPU_XXX_NS functions are only available when TrustZone is activated and CPU in secure state. _NS functions are targeting non secure MPU, in any other cases APIs without NS shall be used.

11.2.2 Initialization and Configuration functions

This section provides the CORTEX HAL driver functions allowing to configure Interrupts SysTick functionalities

This section contains the following APIs:

- ***HAL_NVIC_SetPriorityGrouping()***
- ***HAL_NVIC_SetPriority()***
- ***HAL_NVIC_EnableIRQ()***
- ***HAL_NVIC_DisableIRQ()***
- ***HAL_NVIC_SystemReset()***
- ***HAL_SYSTICK_Config()***

11.2.3 Peripheral Control functions

This subsection provides a set of functions allowing to control the CORTEX (NVIC, SYSTICK, MPU) functionalities.

This section contains the following APIs:

- ***HAL_NVIC_GetPriorityGrouping()***
- ***HAL_NVIC_GetPriority()***

- *HAL_NVIC_SetPendingIRQ()*
- *HAL_NVIC_GetPendingIRQ()*
- *HAL_NVIC_ClearPendingIRQ()*
- *HAL_NVIC_GetActive()*

11.2.4 Detailed description of functions

HAL_NVIC_SetPriorityGrouping

Function name

void HAL_NVIC_SetPriorityGrouping (uint32_t PriorityGroup)

Function description

Set the priority grouping field (pre-emption priority and subpriority) using the required unlock sequence.

Parameters

- **PriorityGroup:** The priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0 0 bit for pre-emption priority, 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1 1 bit for pre-emption priority, 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2 2 bits for pre-emption priority, 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3 3 bits for pre-emption priority, 1 bit for subpriority
  - NVIC_PRIORITYGROUP_4 4 bits for pre-emption priority, 0 bit for subpriority

Return values

- **None:**

Notes

- When the NVIC_PriorityGroup_0 is selected, IRQ pre-emption is no more possible. The pending IRQ priority will be managed only by the subpriority.

HAL_NVIC_SetPriority

Function name

void HAL_NVIC_SetPriority (IRQn_Type IRQn, uint32_t PreemptPriority, uint32_t SubPriority)

Function description

Set the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))
- **PreemptPriority:** The pre-emption priority for the IRQn channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority
- **SubPriority:** the subpriority level for the IRQ channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority.

Return values

- **None:**

HAL_NVIC_EnableIRQ

Function name

void HAL_NVIC_EnableIRQ (IRQn_Type IRQn)

Function description

Enable a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))

Return values

- **None:**

Notes

- To configure interrupts priority correctly, the NVIC_PriorityGroupConfig() function should be called before.

HAL_NVIC_DisableIRQ

Function name

void HAL_NVIC_DisableIRQ (IRQn_Type IRQn)

Function description

Disable a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))

Return values

- **None:**

HAL_NVIC_SystemReset

Function name

void HAL_NVIC_SystemReset (void)

Function description

Initiate a system reset request to reset the MCU.

Return values

- **None:**

HAL_SYSTICK_Config

Function name

uint32_t HAL_SYSTICK_Config (uint32_t TicksNumb)

Function description

Initialize the System Timer with interrupt enabled and start the System Tick Timer (SysTick): Counter is in free running mode to generate periodic interrupts.

Parameters

- **TicksNumb:** Specifies the ticks Number of ticks between two interrupts.

Return values

- **status:** - 0 Function succeeded.
  - 1 Function failed.

HAL_NVIC_GetPriorityGrouping

Function name

uint32_t HAL_NVIC_GetPriorityGrouping (void)

Function description

Get the priority grouping field from the NVIC Interrupt Controller.

Return values

- **Priority:** grouping field (SCB->AIRCR [10:8] PRIGROUP field)

HAL_NVIC_GetPriority

Function name

void HAL_NVIC_GetPriority (IRQn_Type IRQn, uint32_t PriorityGroup, uint32_t * pPreemptPriority, uint32_t * pSubPriority)

Function description

Get the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))
- **PriorityGroup:** the priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0 0 bit for pre-emption priority, 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1 1 bit for pre-emption priority, 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2 2 bits for pre-emption priority, 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3 3 bits for pre-emption priority, 1 bit for subpriority
  - NVIC_PRIORITYGROUP_4 4 bits for pre-emption priority, 0 bit for subpriority
- **pPreemptPriority:** Pointer on the Preemptive priority value (starting from 0).
- **pSubPriority:** Pointer on the Subpriority value (starting from 0).

Return values

- **None:**

HAL_NVIC_GetPendingIRQ

Function name

uint32_t HAL_NVIC_GetPendingIRQ (IRQn_Type IRQn)

Function description

Get Pending Interrupt (read the pending register in the NVIC and return the pending bit for the specified interrupt).

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  - 1 Interrupt status is pending.

HAL_NVIC_SetPendingIRQ

Function name

void HAL_NVIC_SetPendingIRQ (IRQn_Type IRQn)

Function description

Set Pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))

Return values

- **None:**

HAL_NVIC_ClearPendingIRQ

Function name

void HAL_NVIC_ClearPendingIRQ (IRQn_Type IRQn)

Function description

Clear the pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))

Return values

- **None:**

HAL_NVIC_GetActive

Function name

uint32_t HAL_NVIC_GetActive (IRQn_Type IRQn)

Function description

Get active interrupt (read the active register in NVIC and return the active bit).

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32n6xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  - 1 Interrupt status is pending.

HAL_SYSTICK_CLKSourceConfig

Function name

void HAL_SYSTICK_CLKSourceConfig (uint32_t CLKSource)

Function description

Configure the SysTick clock source.

Parameters

- **CLKSource:** specifies the SysTick clock source. This parameter can be one of the following values:
  - SYSTICK_CLKSOURCE_HCLK AHB clock selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_HCLK_DIV8 AHB clock divided by 8 selected as SysTick clock source.

Return values

- **None:**

HAL_SYSTICK_IRQHandler

Function name

void HAL_SYSTICK_IRQHandler (void)

Function description

Handle SYSTICK interrupt request.

Return values

- **None:**

HAL_SYSTICK_Callback

Function name

void HAL_SYSTICK_Callback (void)

Function description

SYSTICK callback.

Return values

- **None:**

HAL_CORTEX_ClearEvent

Function name

void HAL_CORTEX_ClearEvent (void)

Function description

Clear pending event(s).

Return values

- **None:**

HAL_MPU_Enable

Function name

void HAL_MPU_Enable (uint32_t MPU_Control)

Function description

Enable the MPU.

Parameters

- **MPU_Control:** Specifies the control mode of the MPU during hard fault, NMI, FAULTMASK and privileged access to the default memory This parameter can be one of the following values:
  - MPU_HFNMI_PRIVDEF_NONE
  - MPU_HARDFAULT_NMI
  - MPU_PRIVILEGED_DEFAULT
  - MPU_HFNMI_PRIVDEF

Return values

- **None:**

HAL_MPU_Disable

Function name

void HAL_MPU_Disable (void)

Function description

Disable the MPU.

Return values

- **None:**

HAL_MPU_EnableRegion

Function name

void HAL_MPU_EnableRegion (uint32_t RegionNumber)

Function description

Enable the MPU Region.

Return values

- **None:**

HAL_MPU_DisableRegion

Function name

void HAL_MPU_DisableRegion (uint32_t RegionNumber)

Function description

Disable the MPU Region.

Return values

- **None:**

HAL_MPU_ConfigRegion

Function name

void HAL_MPU_ConfigRegion (const MPU_Region_InitTypeDef * pMPU_RegionInit)

Function description

Initialize and configure the Region and the memory to be protected.

Parameters

- **pMPU_RegionInit:** Pointer to a MPU_Region_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

HAL_MPU_ConfigMemoryAttributes

Function name

void HAL_MPU_ConfigMemoryAttributes (const MPU_Attributes_InitTypeDef * pMPU_AttributesInit)

Function description

Initialize and configure the memory attributes.

Parameters

- **pMPU_AttributesInit:** Pointer to a MPU_Attributes_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

11.3 CORTEX Firmware driver defines

12 HAL CRC Generic Driver

12.1 CRC Firmware driver registers structures

12.1.1 CRC_InitTypeDef

CRC_InitTypeDef is defined in the stm32n6xx_hal_crc.h

Data Fields

- ***uint8_t DefaultPolynomialUse***
- ***uint8_t DefaultInitValueUse***
- ***uint32_t GeneratingPolynomial***
- ***uint32_t CRCLength***
- ***uint32_t InitValue***
- ***uint32_t InputDataInversionMode***
- ***uint32_t OutputDataInversionMode***

Field Documentation

- ***uint8_t CRC_InitTypeDef::DefaultPolynomialUse***
  This parameter is a value of ***CRC_Default_Polynomial*** and indicates if default polynomial is used. If set to DEFAULT_POLYNOMIAL_ENABLE, resort to default X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1. In that case, there is no need to set GeneratingPolynomial field. If otherwise set to DEFAULT_POLYNOMIAL_DISABLE, GeneratingPolynomial and CRCLength fields must be set.
- ***uint8_t CRC_InitTypeDef::DefaultInitValueUse***
  This parameter is a value of ***CRC_Default_InitValue_Use*** and indicates if default init value is used. If set to DEFAULT_INIT_VALUE_ENABLE, resort to default 0xFFFFFFFF value. In that case, there is no need to set InitValue field. If otherwise set to DEFAULT_INIT_VALUE_DISABLE, InitValue field must be set.
- ***uint32_t CRC_InitTypeDef::GeneratingPolynomial***
  Set CRC generating polynomial as a 7, 8, 16 or 32-bit long value for a polynomial degree respectively equal to 7, 8, 16 or 32. This field is written in normal, representation e.g., for a polynomial of degree 7, X^7 + X^6 + X^5 + X^2 + 1 is written 0x65. No need to specify it if DefaultPolynomialUse is set to DEFAULT_POLYNOMIAL_ENABLE.
- ***uint32_t CRC_InitTypeDef::CRCLength***
  This parameter is a value of ***CRC_Polynomial_Sizes*** and indicates CRC length. Value can be either one of
  - **CRC_POLYLENGTH_32B** (32-bit CRC),
  - **CRC_POLYLENGTH_16B** (16-bit CRC),
  - **CRC_POLYLENGTH_8B** (8-bit CRC),
  - **CRC_POLYLENGTH_7B** (7-bit CRC).
- ***uint32_t CRC_InitTypeDef::InitValue***
  Init value to initiate CRC computation. No need to specify it if DefaultInitValueUse is set to DEFAULT_INIT_VALUE_ENABLE.
- ***uint32_t CRC_InitTypeDef::InputDataInversionMode***
  This parameter is a value of ***CRCEx_Input_Data_Inversion*** and specifies input data inversion mode. Can be either one of the following values
  - **CRC_INPUTDATA_INVERSION_NONE** no input data inversion
  - **CRC_INPUTDATA_INVERSION_BYTE** byte-wise inversion, 0x1A2B3C4D becomes 0x58D43CB2
  - **CRC_INPUTDATA_INVERSION_HALFWORD** halfword-wise inversion, 0x1A2B3C4D becomes 0xD458B23C
  - **CRC_INPUTDATA_INVERSION_WORD** word-wise inversion, 0x1A2B3C4D becomes 0xB23CD458

- ***uint32_t CRC_InitTypeDef::OutputDataInversionMode***
  This parameter is a value of ***CRCEx_Output_Data_Inversion*** and specifies output data (i.e. CRC) inversion mode. Can be either
  - **CRC_OUTPUTDATA_INVERSION_DISABLE** no CRC inversion,
  - **CRC_OUTPUTDATA_INVERSION_ENABLE** CRC 0x11223344 is converted into 0x22CC4488

12.1.2 CRC_HandleTypeDef

CRC_HandleTypeDef is defined in the stm32n6xx_hal_crc.h

Data Fields

- ***CRC_TypeDef * Instance***
- ***CRC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_CRC_StateTypeDef State***
- ***uint32_t InputDataFormat***

Field Documentation

- ***CRC_TypeDef* CRC_HandleTypeDef::Instance***
  Register base address
- ***CRC_InitTypeDef CRC_HandleTypeDef::Init***
  CRC configuration parameters
- ***HAL_LockTypeDef CRC_HandleTypeDef::Lock***
  CRC Locking object
- ***__IO HAL_CRC_StateTypeDef CRC_HandleTypeDef::State***
  CRC communication state
- ***uint32_t CRC_HandleTypeDef::InputDataFormat***
  This parameter is a value of ***CRC_Input_Buffer_Format*** and specifies input data format. Can be either
  - **CRC_INPUTDATA_FORMAT_BYTES** input data is a stream of bytes (8-bit data)
  - **CRC_INPUTDATA_FORMAT_HALFWORDS** input data is a stream of half-words (16-bit data)
  - **CRC_INPUTDATA_FORMAT_WORDS** input data is a stream of words (32-bit data)

  Note that constant CRC_INPUT_FORMAT_UNDEFINED is defined but an initialization error must occur if InputBufferFormat is not one of the three values listed above

12.2 CRC Firmware driver API description

The following section lists the various functions of the CRC library.

12.2.1 How to use this driver

- Enable CRC AHB clock using __HAL_RCC_CRC_CLK_ENABLE();
- Initialize CRC calculator
  - specify generating polynomial (peripheral default or non-default one)
  - specify initialization value (peripheral default or non-default one)
  - specify input data format
  - specify input or output data inversion mode if any
- Use HAL_CRC_Accumulate() function to compute the CRC value of the input data buffer starting with the previously computed CRC as initialization value
- Use HAL_CRC_Calculate() function to compute the CRC value of the input data buffer starting with the defined initialization value (default or non-default) to initiate CRC calculation

12.2.2 Detailed description of functions

HAL_CRC_Init

Function name

HAL_StatusTypeDef HAL_CRC_Init (CRC_HandleTypeDef * hcrc)

Function description

HAL_CRC_DeInit

Function name

HAL_StatusTypeDef HAL_CRC_DeInit (CRC_HandleTypeDef * hcrc)

Function description

HAL_CRC_MspInit

Function name

void HAL_CRC_MspInit (CRC_HandleTypeDef * hcrc)

Function description

HAL_CRC_MspDeInit

Function name

void HAL_CRC_MspDeInit (CRC_HandleTypeDef * hcrc)

Function description

HAL_CRC_Accumulate

Function name

uint32_t HAL_CRC_Accumulate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

HAL_CRC_Calculate

Function name

uint32_t HAL_CRC_Calculate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

HAL_CRC_GetState

Function name

HAL_CRC_StateTypeDef HAL_CRC_GetState (const CRC_HandleTypeDef * hcrc)

Function description

12.3 CRC Firmware driver defines

The following section lists the various define and macros of the module.

12.3.1 CRC

CRC

Default CRC computation initialization value

DEFAULT_CRC_INITVALUE

Initial CRC default value

Indicates whether or not default init value is used

DEFAULT_INIT_VALUE_ENABLE

Enable initial CRC default value

DEFAULT_INIT_VALUE_DISABLE

Disable initial CRC default value

Indicates whether or not default polynomial is used

DEFAULT_POLYNOMIAL_ENABLE

Enable default generating polynomial 0x04C11DB7

DEFAULT_POLYNOMIAL_DISABLE

Disable default generating polynomial 0x04C11DB7

Default CRC generating polynomial

DEFAULT_CRC32_POLY

X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1

CRC Exported Macros

__HAL_CRC_RESET_HANDLE_STATE

Description:

- Reset CRC handle state.

Parameters:

- __HANDLE__: CRC handle.

Return value:

- None

__HAL_CRC_DR_RESET

Description:

- Reset CRC Data Register.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_INITIALCRCVALUE_CONFIG

Description:

- Set CRC INIT non-default value.

Parameters:

- __HANDLE__: CRC handle
- __INIT__: 32-bit initial value

Return value:

- None

__HAL_CRC_SET_IDR

Description:

- Store data in the Independent Data (ID) register.

Parameters:

- __HANDLE__: CRC handle
- __VALUE__: Value to be stored in the ID register

Return value:

- None

Notes:

- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

__HAL_CRC_GET_IDR

Description:

- Return the data stored in the Independent Data (ID) register.

Parameters:

- __HANDLE__: CRC handle

Return value:

- Value: of the ID register

Notes:

- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

Input Buffer Format

CRC_INPUTDATA_FORMAT_UNDEFINED

Undefined input data format

CRC_INPUTDATA_FORMAT_BYTES

Input data in byte format

CRC_INPUTDATA_FORMAT_HALFWORDS

Input data in half-word format

CRC_INPUTDATA_FORMAT_WORDS

Input data in word format

Polynomial sizes to configure the peripheral

CRC_POLYLENGTH_32B

Resort to a 32-bit long generating polynomial

CRC_POLYLENGTH_16B

Resort to a 16-bit long generating polynomial

CRC_POLYLENGTH_8B

Resort to a 8-bit long generating polynomial

CRC_POLYLENGTH_7B

Resort to a 7-bit long generating polynomial

CRC polynomial possible sizes actual definitions

HAL_CRC_LENGTH_32B

32-bit long CRC

HAL_CRC_LENGTH_16B

16-bit long CRC

HAL_CRC_LENGTH_8B

8-bit long CRC

HAL_CRC_LENGTH_7B

7-bit long CRC

13 HAL CRC Extension Driver

13.1 CRCEx Firmware driver API description

The following section lists the various functions of the CRCEx library.

13.1.1 How to use this driver

- Set user-defined generating polynomial through HAL_CRCEx_Polynomial_Set()
- Configure Input or Output data inversion

13.1.2 Detailed description of functions

HAL_CRCEx_Polynomial_Set

Function name

HAL_StatusTypeDef HAL_CRCEx_Polynomial_Set (CRC_HandleTypeDef * hcrc, uint32_t Pol, uint32_t PolyLength)

Function description

HAL_CRCEx_Input_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Input_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t InputReverseMode)

Function description

HAL_CRCEx_Output_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Output_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t OutputReverseMode)

Function description

13.2 CRCEx Firmware driver defines

The following section lists the various define and macros of the module.

13.2.1 CRCEx

CRCEx

CRC Extended Exported Macros

__HAL_CRC_OUTPUTREVERSAL_BIT_ENABLE

Description:

- Set CRC output bit-reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_OUTPUTREVERSAL_HALFWORD_ENABLE

Description:

- Set CRC output halfword-reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_OUTPUTREVERSAL_BYTE_ENABLE

Description:

- Set CRC output byte-reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_OUTPUTREVERSAL_ENABLE

__HAL_CRC_OUTPUTREVERSAL_DISABLE

Description:

- Unset CRC output reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_POLYNOMIAL_CONFIG

Description:

- Set CRC non-default polynomial.

Parameters:

- __HANDLE__: CRC handle
- __POLYNOMIAL__: 7, 8, 16 or 32-bit polynomial

Return value:

- None

Input Data Inversion Modes

CRC_INPUTDATA_INVERSION_NONE

No input data inversion

CRC_INPUTDATA_INVERSION_HALFWORD_BYWORD

Input data half-word-reversal done by word

CRC_INPUTDATA_INVERSION_BYTE_BYWORD

Input data byte-reversal done by word

CRC_INPUTDATA_INVERSION_BIT_BYBYTE

Input data bit-reversal done by byte

CRC_INPUTDATA_INVERSION_BIT_BYHALFWORD

Input data bit-reversal done by half-word

CRC_INPUTDATA_INVERSION_BIT_BYWORD

Input data bit-reversal done by word

CRC_INPUTDATA_INVERSION_BYTE

Definition for compatibility with legacy code

CRC_INPUTDATA_INVERSION_HALFWORD

Definition for compatibility with legacy code

CRC_INPUTDATA_INVERSION_WORD

Definition for compatibility with legacy code

Output Data Inversion Modes

CRC_OUTPUTDATA_INVERSION_DISABLE

No output data inversion

CRC_OUTPUTDATA_INVERSION_BIT

Output data bit-reversal

CRC_OUTPUTDATA_INVERSION_HALFWORD

Output data half-word-reversal done by word

CRC_OUTPUTDATA_INVERSION_BYTE

Output data byte-reversal done by word

CRC_OUTPUTDATA_INVERSION_ENABLE

Definition for compatibility with legacy code

14 HAL CRYP Generic Driver

14.1 CRYP Firmware driver registers structures

14.1.1 CRYP_ConfigTypeDef

CRYP_ConfigTypeDef is defined in the stm32n6xx_hal_cryp.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint32_t * pKey***
- ***uint32_t * pInitVect***
- ***uint32_t Algorithm***
- ***uint32_t * Header***
- ***uint32_t HeaderSize***
- ***uint32_t * B0***
- ***uint32_t DataWidthUnit***
- ***uint32_t HeaderWidthUnit***
- ***uint32_t KeyIVConfigSkip***
- ***uint32_t KeyMode***
- ***uint32_t KeySelect***
- ***uint32_t KeyProtection***

Field Documentation

- ***uint32_t CRYP_ConfigTypeDef::DataType***
  32-bit data, 16-bit data, 8-bit data or 1-bit string. This parameter can be a value of ***CRYP_Data_Type***
- ***uint32_t CRYP_ConfigTypeDef::KeySize***
  Used only in AES mode : 128, 192 or 256 bit key length in CRYP1. This parameter can be a value of ***CRYP_Key_Size***
- ***uint32_t* CRYP_ConfigTypeDef::pKey***
  The key used for encryption/decryption
- ***uint32_t* CRYP_ConfigTypeDef::pInitVect***
  The initialization vector used also as initialization counter in CTR mode
- ***uint32_t CRYP_ConfigTypeDef::Algorithm***
  AES Algorithm ECB/CBC/CTR/GCM or CCM This parameter can be a value of ***CRYP_CR_ALGOMODE***
- ***uint32_t* CRYP_ConfigTypeDef::Header***
  used only in AES GCM and CCM Algorithm for authentication, GCM : also known as Additional Authentication Data CCM : named B1 composed of the associated data length and Associated Data.
- ***uint32_t CRYP_ConfigTypeDef::HeaderSize***
  The size of header buffer in word
- ***uint32_t* CRYP_ConfigTypeDef::B0***
  B0 is first authentication block used only in AES CCM mode
- ***uint32_t CRYP_ConfigTypeDef::DataWidthUnit***
  Data With Unit, this parameter can be value of ***CRYP_Data_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::HeaderWidthUnit***
  Header Width Unit, this parameter can be value of ***CRYP_Header_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::KeyIVConfigSkip***
  CRYP peripheral Key and IV configuration skip, to configure Key and Initialization Vector only once and to skip configuration for consecutive processing. This parameter can be a value of ***CRYP_Configuration_Skip***
- ***uint32_t CRYP_ConfigTypeDef::KeyMode***
  Key mode selection, this parameter can be a value of ***CRYP_Key_Mode***
- ***uint32_t CRYP_ConfigTypeDef::KeySelect***
  Only for SAES : Key selection, this parameter can be a value of ***CRYP_Key_Select***

- ***uint32_t CRYP_ConfigTypeDef::KeyProtection***
  Only for SAES : Key protection, this parameter can be a value of ***CRYP_Key_Protection***

14.1.2 __CRYP_HandleTypeDef

__CRYP_HandleTypeDef is defined in the stm32n6xx_hal_cryp.h

Data Fields

- ***void * Instance***
- ***CRYP_ConfigTypeDef Init***
- ***uint32_t * pCrypInBuffPtr***
- ***uint32_t * pCrypOutBuffPtr***
- ***__IO uint16_t CrypHeaderCount***
- ***__IO uint16_t CrypInCount***
- ***__IO uint16_t CrypOutCount***
- ***uint16_t Size***
- ***uint32_t Phase***
- ***DMA_HandleTypeDef * hdmain***
- ***DMA_HandleTypeDef * hdmaout***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_CRYP_STATETypeDef State***
- ***__IO uint32_t ErrorCode***
- ***uint32_t Version***
- ***uint32_t KeyIVConfig***
- ***uint32_t SizesSum***
- ***void(* InCpltCallback***
- ***void(* OutCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***void* __CRYP_HandleTypeDef::Instance***
  CRYP or SAES registers base address
- ***CRYP_ConfigTypeDef __CRYP_HandleTypeDef::Init***
  CRYP required parameters
- ***uint32_t* __CRYP_HandleTypeDef::pCrypInBuffPtr***
  Pointer to CRYP processing (encryption, decryption,...) buffer
- ***uint32_t* __CRYP_HandleTypeDef::pCrypOutBuffPtr***
  Pointer to CRYP processing (encryption, decryption,...) buffer
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypHeaderCount***
  Counter of header data
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypInCount***
  Counter of input data
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypOutCount***
  Counter of output data
- ***uint16_t __CRYP_HandleTypeDef::Size***
  length of input data in word or in byte, according to DataWidthUnit
- ***uint32_t __CRYP_HandleTypeDef::Phase***
  CRYP peripheral phase
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmain***
  CRYP In DMA handle parameters
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmaout***
  CRYP Out DMA handle parameters
- ***HAL_LockTypeDef __CRYP_HandleTypeDef::Lock***
  CRYP locking object

- ***__IO HAL_CRYP_STATETypeDef __CRYP_HandleTypeDef::State***
  CRYP peripheral state
- ***__IO uint32_t __CRYP_HandleTypeDef::ErrorCode***
  CRYP peripheral error code
- ***uint32_t __CRYP_HandleTypeDef::Version***
  CRYP1 IP version
- ***uint32_t __CRYP_HandleTypeDef::KeyIVConfig***
  CRYP peripheral Key and IV configuration flag, used when configuration can be skipped
- ***uint32_t __CRYP_HandleTypeDef::SizesSum***
  Sum of successive payloads lengths (in bytes), stored for a single signature computation after several messages processing
- ***void(* __CRYP_HandleTypeDef::InCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Input FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::OutCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Output FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::ErrorCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Error callback
- ***void(* __CRYP_HandleTypeDef::MspInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp Init callback
- ***void(* __CRYP_HandleTypeDef::MspDeInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp DeInit callback

14.2 CRYP Firmware driver defines

The following section lists the various define and macros of the module.

14.2.1 CRYP

CRYP

SAES peripheral Clear Flags

CRYP_CLEAR_CCF

SAES peripheral clear Computation Complete Flag

CRYP_CLEAR_RWEIF

SAES peripheral clear Error Flag : RWEIF in SAES_ISR and both RDERR and WRERR flags in SAES_SR

CRYP_CLEAR_KEIF

SAES peripheral clear Key Error Flag: KEIF in SAES_ISR

CRYP_CLEAR_RNGEIF

SAES peripheral clear RNG error Flag

CRYP Key and IV Configuration Skip Mode

CRYP_KEYIVCONFIG_ALWAYS

Peripheral Key and IV configuration to do systematically

CRYP_KEYIVCONFIG_ONCE

Peripheral Key and IV configuration to do only once

CRYP_KEYNOCONFIG

Peripheral Key configuration to not do

CRYP Algorithm Mode

CRYP_AES_ECB

CRYP_AES_CBC

CRYP_AES_CTR

CRYP_AES_KEY

CRYP_AES_GCM

CRYP_AES_CCM

CRYP Data Type

CRYP_DATATYPE_32B

CRYP_DATATYPE_16B

CRYP_DATATYPE_8B

CRYP_DATATYPE_1B

CRYP_NO_SWAP
: 32-bit data type (no swapping)

CRYP_HALFWORD_SWAP
: 16-bit data type (half-word swapping)

CRYP_BYTE_SWAP
: 8-bit data type (byte swapping)

CRYP_BIT_SWAP
: 1-bit data type (bit swapping)

CRYP Data Width Unit

CRYP_DATAWIDTHUNIT_WORD
: By default, size unit is word

CRYP_DATAWIDTHUNIT_BYTE
: By default, size unit is byte

CRYP Error Definition

HAL_CRYP_ERROR_NONE
: No error

HAL_CRYP_ERROR_WRITE
: Write error

HAL_CRYP_ERROR_READ
: Read error

HAL_CRYP_ERROR_DMA
: DMA error

HAL_CRYP_ERROR_BUSY
: Busy flag error

HAL_CRYP_ERROR_TIMEOUT

Timeout error

HAL_CRYP_ERROR_NOT_SUPPORTED

Not supported mode

HAL_CRYP_ERROR_AUTH_TAG_SEQUENCE

Sequence are not respected only for GCM or CCM

HAL_CRYP_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_CRYP_ERROR_KEY

Key error

HAL_CRYP_ERROR_RNG

RNG error

CRYP Exported Macros

IS_CRYP_INSTANCE

Description:

- Inform about which IP is the current INSTANCE: CRYP or SAES.

Parameters:

- INSTANCE: specifies the HW instance.

Return value:

- None

IS_SAES_INSTANCE

__HAL_CRYP_RESET_HANDLE_STATE

Description:

- Reset CRYP handle state.

Parameters:

- __HANDLE__: specifies the CRYP handle.

Return value:

- None

__HAL_CRYP_ENABLE

Description:

- Enable/Disable the CRYP or SAES peripheral.

Parameters:

- __HANDLE__: specifies the CRYP handle.

Return value:

- None

__HAL_CRYP_DISABLE

CRYP_FLAG_MASK

Description:

- Check whether the specified CRYP or SAES peripheral status flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - CRYP_FLAG_BUSY: The CRYP core is currently processing a block of data or a key preparation (for AES decryption)
  - CRYP_FLAG_KEYVALID Key valid flag
  - CRYP_FLAG_KEIF Key error flag
  - CRYP_FLAG_IFEM: Input FIFO is empty (CRYP peripheral only)
  - CRYP_FLAG_IFNF: Input FIFO is not full (CRYP peripheral only)
  - CRYP_FLAG_INRIS: Input FIFO service raw interrupt is pending (CRYP peripheral only)
  - CRYP_FLAG_OFNE: Output FIFO is not empty (CRYP peripheral only)
  - CRYP_FLAG_OFFU: Output FIFO is full (CRYP peripheral only)
  - CRYP_FLAG_OUTRIS: Input FIFO service raw interrupt is pending (CRYP peripheral only)
  - CRYP_FLAG_WRERR Write Error flag (SAES peripheral only)
  - CRYP_FLAG_RDERR Read Error flag (SAES peripheral only)
  - CRYP_FLAG_CCF Computation Complete flag (SAES peripheral only)
  - CRYP_FLAG_RWEIF Read/write Error flag (SAES peripheral only)
  - CRYP_FLAG_RNGEIF RNG Error flag (SAES peripheral only)

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_CRYP_GET_FLAG

__HAL_CRYP_CLEAR_FLAG

Description:

- Clear the SAES peripheral pending status flag.

Parameters:

- __HANDLE__: specifies the SAES handle.
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - CRYP_CLEAR_RWEIF Read (RDERR), Write (WRERR) or Read/write (RWEIF) Error Flag Clear
  - CRYP_CLEAR_CCF Computation Complete Flag (CCF) Clear
  - CRYP_CLEAR_KEIF Key error interrupt flag clear
  - CRYP_CLEAR_RNGEIF RNG error interrupt flag clear

Return value:

- None

__HAL_CRYP_GET_IT

Description:

- Check whether the specified CRYP peripheral interrupt is set or not.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: specifies the interrupt to check. This parameter can be one of the following values:
  - CRYP_IT_INI: Input FIFO service masked interrupt status
  - CRYP_IT_OUTI: Output FIFO service masked interrupt status

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_CRYP_ENABLE_IT

Description:

- Enable the CRYP or SAES peripheral interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: Interrupt. This parameter can be one of the following values:
  - CRYP_IT_INI Input FIFO service interrupt mask (CRYP peripheral only)
  - CRYP_IT_OUTI Output FIFO service interrupt mask (CRYP peripheral only)
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR) (SAES peripheral only)
  - CRYP_IT_CCFIE Computation Complete interrupt (SAES peripheral only)
  - CRYP_IT_KEIE Key error interrupt (SAES peripheral only)
  - CRYP_IT_RNGEIE RNG interrupt (SAES peripheral only)

Return value:

- None

__HAL_CRYP_DISABLE_IT

Description:

- Disable the CRYP or SAES peripheral interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: Interrupt. This parameter can be one of the following values:
  - CRYP_IT_INI Input FIFO service interrupt mask (CRYP peripheral only)
  - CRYP_IT_OUTI Output FIFO service interrupt mask (CRYP peripheral only)
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR) (SAES peripheral only)
  - CRYP_IT_CCFIE Computation Complete interrupt (SAES peripheral only)
  - CRYP_IT_KEIE Key error interrupt (SAES peripheral only)
  - CRYP_IT_RNGEIE RNG interrupt (SAES peripheral only)

Return value:

- None

__HAL_CRYP_GET_IT_SOURCE

Description:

- Check whether the specified SAES peripheral interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: interrupt source to check This parameter can be one of the following values for TinyAES:
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR)
  - CRYP_IT_CCFIE Computation Complete interrupt
  - CRYP_IT_KEIE Key error interrupt
  - CRYP_IT_RNGEIE RNG error interrupt

Return value:

- State: of interruption (TRUE or FALSE).

CRYP & SAES Flags

CRYP_FLAG_IFEM

CRYP peripheral Input FIFO is empty

CRYP_FLAG_IFNF

CRYP peripheral Input FIFO is not Full

CRYP_FLAG_OFNE

CRYP peripheral Output FIFO is not empty

CRYP_FLAG_OFFU

CRYP peripheral Output FIFO is Full

CRYP_FLAG_KERF

CRYP peripheral Key error flag

CRYP_FLAG_OUTRIS

Output FIFO service raw interrupt status

CRYP_FLAG_INRIS

Input FIFO service raw interrupt status

CRYP_FLAG_BUSY

The CRYP peripheral is currently processing a block of data or a key preparation (for AES decryption).

CRYP_FLAG_KEYVALID

CRYP or SAES peripheral Key valid flag

SAES_FLAG_BUSY

The SAES peripheral is currently processing a block of data or a key preparation (for AES decryption).

CRYP_FLAG_WRERR

SAES peripheral Write Error flag

CRYP_FLAG_RDERR

SAES peripheral Read error flag

CRYP_FLAG_CCF

SAES peripheral Computation completed flag as AES_ISR_CCF

CRYP_FLAG_KEIF

SAES peripheral Key error interrupt flag

CRYP_FLAG_RWEIF

SAES peripheral Read or Write error Interrupt flag

CRYP_FLAG_RNGEIF

SAES peripheral RNG error Interrupt flag

CRYP Header Width Unit

CRYP_HEADERWIDTHUNIT_WORD

By default, size unit is word

CRYP_HEADERWIDTHUNIT_BYTE

By default, size unit is byte

CRYP and SAES peripherals interrupts

CRYP_IT_INI

CRYP peripheral input FIFO Interrupt

CRYP_IT_OUTI

CRYP peripheral output FIFO Interrupt

CRYP_IT_CCFIE

SAES peripheral computation Complete interrupt enable

CRYP_IT_RWEIE

SAES peripheral read or write Error interrupt enable

CRYP_IT_KEIE

SAES peripheral key error interrupt enable

CRYP_IT_RNGEIE

SAES peripheral RNG error interrupt enable

CRYP Private macros to check input parameters

IS_CRYP_ALGORITHM

IS_CRYP_KEYSIZE

IS_CRYP_DATATYPE

IS_CRYP_INIT

IS_CRYP_KEYIVCONFIG

IS_CRYP_KEYMODE

IS_SAES_ALGORITHM

IS_SAES_KEYSIZE

IS_SAES_DATATYPE

IS_SAES_KEYMODE

IS_SAES_KEYPROT

IS_SAES_KEYSEL

IS_SAES_KEYSHARED

CRYP or SAES Key Mode

CRYP_KEYMODE_NORMAL

Normal key usage, Key registers are freely usable

CRYP_KEYMODE_WRAPPED

Only for SAES, Wrapped key: to encrypt or decrypt AES keys

CRYP_KEYMODE_SHARED

Key shared by SAES peripheral

SAES Key Protection

CRYP_KEYPROT_ENABLE

Only for SAES, Key can't be shared between two applications with different security contexts

CRYP_KEYPROT_DISABLE

Only for SAES, Key can be shared between two applications with different security contexts

SAES Key Select

CRYP_KEYSEL_NORMAL

Normal key, key registers SAES_KEYx or CRYP_KEYx

CRYP_KEYSEL_HW

Only for SAES, Hardware key : derived hardware unique key (DHUK 256-bit)

CRYP_KEYSEL_SW

Only for SAES, Software key : boot hardware key BHK (256-bit)

CRYP_KEYSEL_HSW

Only for SAES, DHUK XOR BHK Hardware unique key XOR software key

CRYP_KEYSEL_AHK

Only for SAES, Software key : application hardware key AHK (128- or 256-bit)

CRYP_KEYSEL_DUK_AHK

Only for SAES, DHUK XOR AHK

CRYP_KEYSEL_TEST_KEY

Test mode key (256-bit hardware constant key 0xA5A5...A5A5)

SAES Key Shared with Peripheral

CRYP_KEYSHARED_CRYP

Only for SAES, key is shared with CRYP peripheral

CRYP Key Size

CRYP_KEYSIZE_128B

CRYP_KEYSIZE_192B

CRYP_KEYSIZE_256B

SAES processing mode

CRYP_MODE_ENCRYPT

SAES peripheral encryption mode

CRYP_MODE_KEY_DERIVATION

SAES peripheral key derivation

CRYP_MODE_DECRYPT

SAES peripheral decryption mode

CRYP_OPERATINGMODE_ENCRYPT

CRYP peripheral encryption mode

CRYP_OPERATINGMODE_DECRYPT

CRYP peripheral decryption mode

15 HAL CRYP Extension Driver

15.1 CRYPEx Firmware driver API description

The following section lists the various functions of the CRYPEx library.

15.1.1 How to use this driver

The CRYP extension HAL driver can be used after AES-GCM or AES-CCM Encryption/Decryption to get the authentication messages.

15.1.2 Detailed description of functions

HAL_CRYPEx_AESGCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESGCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, const uint32_t * pAuthTag, uint32_t Timeout)

Function description

HAL_CRYPEx_AESCCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESCCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, const uint32_t * pAuthTag, uint32_t Timeout)

Function description

HAL_CRYPEx_EncryptSharedKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_EncryptSharedKey (CRYP_HandleTypeDef * hcryp, uint32_t * Key, uint32_t * Output, uint32_t ID, uint32_t Timeout)

Function description

HAL_CRYPEx_DecryptSharedKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_DecryptSharedKey (CRYP_HandleTypeDef * hcryp, uint32_t * Key, uint32_t ID, uint32_t Timeout)

Function description

HAL_CRYPEx_UnwrapKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_UnwrapKey (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint32_t Timeout)

Function description

HAL_CRYPEx_WrapKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_WrapKey (CRYP_HandleTypeDef * hcryp, uint32_t * Input, uint32_t * Output, uint32_t Timeout)

Function description

16 HAL DCMIPP Generic Driver

16.1 DCMIPP Firmware driver registers structures

16.1.1 DCMIPP_EmbeddedSyncUnmaskTypeDef

DCMIPP_EmbeddedSyncUnmaskTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint8_t FrameStartUnmask***
- ***uint8_t LineStartUnmask***
- ***uint8_t LineEndUnmask***
- ***uint8_t FrameEndUnmask***

Field Documentation

- ***uint8_t DCMIPP_EmbeddedSyncUnmaskTypeDef::FrameStartUnmask***
  Specifies the frame start delimiter unmask.
- ***uint8_t DCMIPP_EmbeddedSyncUnmaskTypeDef::LineStartUnmask***
  Specifies the line start delimiter unmask.
- ***uint8_t DCMIPP_EmbeddedSyncUnmaskTypeDef::LineEndUnmask***
  Specifies the line end delimiter unmask.
- ***uint8_t DCMIPP_EmbeddedSyncUnmaskTypeDef::FrameEndUnmask***
  Specifies the frame end delimiter unmask.

16.1.2 DCMIPP_EmbeddedSyncCodesTypeDef

DCMIPP_EmbeddedSyncCodesTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint8_t FrameStartCode***
- ***uint8_t LineStartCode***
- ***uint8_t LineEndCode***
- ***uint8_t FrameEndCode***

Field Documentation

- ***uint8_t DCMIPP_EmbeddedSyncCodesTypeDef::FrameStartCode***
  Specifies the code of the frame start delimiter.
- ***uint8_t DCMIPP_EmbeddedSyncCodesTypeDef::LineStartCode***
  Specifies the code of the line start delimiter.
- ***uint8_t DCMIPP_EmbeddedSyncCodesTypeDef::LineEndCode***
  Specifies the code of the line end delimiter.
- ***uint8_t DCMIPP_EmbeddedSyncCodesTypeDef::FrameEndCode***
  Specifies the code of the frame end delimiter.

16.1.3 DCMIPP_CSI_PIPE_ConfTypeDef

DCMIPP_CSI_PIPE_ConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t DataTypeMode***
- ***uint32_t DataTypeIDA***
- ***uint32_t DataTypeIDB***

Field Documentation

- ***uint32_t DCMIPP_CSI_PIPE_ConfTypeDef::DataTypeMode***
  Configures the Data Type Mode This parameter can be a value from ***DCMIPP_DataTypeMode***
- ***uint32_t DCMIPP_CSI_PIPE_ConfTypeDef::DataTypeIDA***
  Configures the Data type selection ID-A This parameter can be a value from ***DCMIPP_DataType***

- ***uint32_t DCMIPP_CSI_PIPE_ConfTypeDef::DataTypeIDB***
  Configures the Data type selection ID-B This parameter can be a value from ***DCMIPP_DataType***

16.1.4 DCMIPP_CSI_ConfTypeDef

DCMIPP_CSI_ConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t NumberOfLanes***
- ***uint32_t DataLaneMapping***
- ***uint32_t PHYBitrate***

Field Documentation

- ***uint32_t DCMIPP_CSI_ConfTypeDef::NumberOfLanes***
  Configures the Number of Lanes This parameter can be a value from ***DCMIPP_CSI_Number_Of_Lanes***
- ***uint32_t DCMIPP_CSI_ConfTypeDef::DataLaneMapping***
  Configures the Data Lane Mapping This parameter can be a value from ***DCMIPP_CSI_DataLaneMapping***
- ***uint32_t DCMIPP_CSI_ConfTypeDef::PHYBitrate***
  Configures the Phy Bitrate This parameter can be a value from ***DCMIPP_CSI_PHYBitRate***

16.1.5 DCMIPP_CSI_VCFilteringConfTypeDef

DCMIPP_CSI_VCFilteringConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t DataTypeNB***
- ***uint32_t DataTypeClass***
- ***uint32_t DataTypeFormat***

Field Documentation

- ***uint32_t DCMIPP_CSI_VCFilteringConfTypeDef::DataTypeNB***
  Configures the Data Type number This parameter can be a value from ***DCMIPP_CSI_DataTypeID***
- ***uint32_t DCMIPP_CSI_VCFilteringConfTypeDef::DataTypeClass[MAX_DATATYPE_NB]***
  Configures the Data Type Class This parameter can be a value between 0 and 63
- ***uint32_t DCMIPP_CSI_VCFilteringConfTypeDef::DataTypeFormat[MAX_DATATYPE_NB]***
  Configures the Data Type Class This parameter can be a value from ***DCMIPP_CSI_DataTypeFormat***

16.1.6 DCMIPP_CSI_TimerConfTypeDef

DCMIPP_CSI_TimerConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VirtualChannel***
- ***uint32_t StartPoint***
- ***uint32_t Count***

Field Documentation

- ***uint32_t DCMIPP_CSI_TimerConfTypeDef::VirtualChannel***
  The Virtual Channel ID This parameter can be a value from ***DCMIPP_Virtual_Channel***
- ***uint32_t DCMIPP_CSI_TimerConfTypeDef::StartPoint***
  The Start Point of the counter This parameter can be a value from ***DCMIPP_CSI_Timer_StartPoint***
- ***uint32_t DCMIPP_CSI_TimerConfTypeDef::Count***
  Number of clock cycle to count from the start point This parameter can be a value between 0 and 0x1FFFFFF

16.1.7 DCMIPP_CSI_LineByteCounterConfTypeDef

DCMIPP_CSI_LineByteCounterConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VirtualChannel***
- ***uint32_t LineCounter***
- ***uint32_t ByteCounter***

Field Documentation

- ***uint32_t DCMIPP_CSI_LineByteCounterConfTypeDef::VirtualChannel***
  Configures the Virtual Channel ID This parameter can be a value from ***DCMIPP_Virtual_Channel***
- ***uint32_t DCMIPP_CSI_LineByteCounterConfTypeDef::LineCounter***
  Configures the Line Number This parameter can be a value between 0 and 65535
- ***uint32_t DCMIPP_CSI_LineByteCounterConfTypeDef::ByteCounter***
  Configures the Byte Number This parameter can be a value between 0 and 65535

16.1.8 DCMIPP_ParallelConfTypeDef

DCMIPP_ParallelConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t Format***
- ***uint32_t VSPolarity***
- ***uint32_t HSPolarity***
- ***uint32_t PCKPolarity***
- ***uint32_t ExtendedDataMode***
- ***uint32_t SynchroMode***
- ***DCMIPP_EmbeddedSyncCodesTypeDef SynchroCodes***
- ***uint32_t SwapBits***
- ***uint32_t SwapCycles***

Field Documentation

- ***uint32_t DCMIPP_ParallelConfTypeDef::Format***
  Configures the DCMIPP Format This parameter can be one value of ***DCMIPP_Format***
- ***uint32_t DCMIPP_ParallelConfTypeDef::VSPolarity***
  Specifies the Vertical synchronization polarity: High or Low. This parameter can be a value of ***DCMIPP_VSYNC_Polarity***
- ***uint32_t DCMIPP_ParallelConfTypeDef::HSPolarity***
  Specifies the Horizontal synchronization polarity: High or Low. This parameter can be a value of ***DCMIPP_HSYNC_Polarity***
- ***uint32_t DCMIPP_ParallelConfTypeDef::PCKPolarity***
  Specifies the Pixel clock polarity: Falling or Rising. This parameter can be a value of ***DCMIPP_PIXCK_Polarity***
- ***uint32_t DCMIPP_ParallelConfTypeDef::ExtendedDataMode***
  Specifies the data width: 8-bit, 10-bit, 12-bit 14-bit or 16-bits. This parameter can be a value of ***DCMIPP_Extended_Data_Mode***
- ***uint32_t DCMIPP_ParallelConfTypeDef::SynchroMode***
  Specifies the Synchronization Mode: Hardware or Embedded. This parameter can be a value of ***DCMIPP_Synchronization_Mode***
- ***DCMIPP_EmbeddedSyncCodesTypeDef DCMIPP_ParallelConfTypeDef::SynchroCodes***
  Specifies the code of the line/frame start delimiter and the line/frame end delimiter
- ***uint32_t DCMIPP_ParallelConfTypeDef::SwapBits***
  Enable or Disable the Swap Bits. This parameter can be a value of ***DCMIPP_SWAP_BITS***
- ***uint32_t DCMIPP_ParallelConfTypeDef::SwapCycles***
  Enable or Disable the Swap Cycles. This parameter can be a value of ***DCMIPP_SWAP_CYCLES***

16.1.9 DCMIPP_PipeConfTypeDef

DCMIPP_PipeConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t FrameRate***
- ***uint32_t PixelPipePitch***
- ***uint32_t PixelPackerFormat***

Field Documentation

- ***uint32_t DCMIPP_PipeConfTypeDef::FrameRate***
  Configures the DCMIPP Pipe Frame Rate This parameter can be one value of ***DCMIPP_Frame_Rates***
- ***uint32_t DCMIPP_PipeConfTypeDef::PixelPipePitch***
  Configures the DCMIPP Pixel Pipe Pitch This parameter can be one value from
- ***uint32_t DCMIPP_PipeConfTypeDef::PixelPackerFormat***
  Configures the DCMIPP Pixel Pipe Format This parameter can be one value from ***DCMIPP_Pixel_Packer_Format***

16.1.10 DCMIPP_IPPlugConfTypeDef

DCMIPP_IPPlugConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t Client***
- ***uint32_t MemoryPageSize***
- ***uint32_t Traffic***
- ***uint32_t MaxOutstandingTransactions***
- ***uint32_t DPREGStart***
- ***uint32_t DPREGEnd***
- ***uint32_t WLRURatio***

Field Documentation

- ***uint32_t DCMIPP_IPPlugConfTypeDef::Client***
  Configures the DCMIPP IPPLUG Client This parameter can be a value from ***DCMIPP_IPPLUG_Client***
- ***uint32_t DCMIPP_IPPlugConfTypeDef::MemoryPageSize***
  Configures the DCMIPP IPPLUG Memory page size This parameter can be a value from ***DCMIPP_Memory_Page_Size***
- ***uint32_t DCMIPP_IPPlugConfTypeDef::Traffic***
  Configures the DCMIPP IPPLUG Traffic This parameter can be a value from ***DCMIPP_Traffic_Burst_Size***
- ***uint32_t DCMIPP_IPPlugConfTypeDef::MaxOutstandingTransactions***
  Configures the DCMIPP IPPLUG Maximum outstanding transactions This parameter can be a value from DCMIPP_Maximum_Outstanding_Transactions
- ***uint32_t DCMIPP_IPPlugConfTypeDef::DPREGStart***
  Configures the End word of the FIFO of Clientx This parameter can be a value between 0 and 0x3FF
- ***uint32_t DCMIPP_IPPlugConfTypeDef::DPREGEnd***
  Configures the Start word of the FIFO of Clientx This parameter can be a value between 0 and 0x3FF
- ***uint32_t DCMIPP_IPPlugConfTypeDef::WLRURatio***
  Configures the DCMIPP Ratio for WLRU arbitration This parameter can be a value between 0 and 15

16.1.11 DCMIPP_CropConfTypeDef

DCMIPP_CropConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VStart***
- ***uint32_t HStart***
- ***uint32_t VSize***
- ***uint32_t HSize***
- ***uint32_t PipeArea***

Field Documentation

- ***uint32_t DCMIPP_CropConfTypeDef::VStart***
  Configures the DCMIPP Crop Vertical Start This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_CropConfTypeDef::HStart***
  Configures the DCMIPP Crop Horizontal Start This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_CropConfTypeDef::VSize***
  Configures the DCMIPP Crop Vertical Size This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_CropConfTypeDef::HSize***
  Configures the DCMIPP Crop Horizontal Size This parameter can be one value between 1 and 4095

- ***uint32_t DCMIPP_CropConfTypeDef::PipeArea***
  Configures the DCMIPP Crop Area for the pipe0 This parameter can be one value of ***DCMIPP_Crop_Area***

16.1.12 DCMIPP_StatisticExtractionAreaConfTypeDef

DCMIPP_StatisticExtractionAreaConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VStart***
- ***uint32_t HStart***
- ***uint32_t VSize***
- ***uint32_t HSize***

Field Documentation

- ***uint32_t DCMIPP_StatisticExtractionAreaConfTypeDef::VStart***
  Configures the DCMIPP Statistic Extraction Vertical Start This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_StatisticExtractionAreaConfTypeDef::HStart***
  Configures the DCMIPP Statistic Extraction Horizontal Start This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_StatisticExtractionAreaConfTypeDef::VSize***
  Configures the DCMIPP Statistic Extraction Vertical Size This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_StatisticExtractionAreaConfTypeDef::HSize***
  Configures the DCMIPP Statistic Extraction Horizontal Size This parameter can be one value between 0 and 4095

16.1.13 DCMIPP_StatisticExtractionConfTypeDef

DCMIPP_StatisticExtractionConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t Source***
- ***uint32_t Bins***

Field Documentation

- ***uint32_t DCMIPP_StatisticExtractionConfTypeDef::Mode***
  Configures the DCMIPP Statistic Extraction Mode This parameter can be a value from ***DCMIPP_Statistics_Extraction_Mode***
- ***uint32_t DCMIPP_StatisticExtractionConfTypeDef::Source***
  Configures the DCMIPP Statistic Extraction Source This parameter can be a value from ***DCMIPP_Statistics_Extraction_Source***
- ***uint32_t DCMIPP_StatisticExtractionConfTypeDef::Bins***
  Configures the DCMIPP Statistic Extraction Bins This parameter can be a value from ***DCMIPP_Statistics_Extraction_Bins***

16.1.14 DCMIPP_ExposureConfTypeDef

DCMIPP_ExposureConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint8_t ShiftRed***
- ***uint8_t MultiplierRed***
- ***uint8_t ShiftGreen***
- ***uint8_t MultiplierGreen***
- ***uint8_t ShiftBlue***
- ***uint8_t MultiplierBlue***

Field Documentation

- ***uint8_t DCMIPP_ExposureConfTypeDef::ShiftRed***
  Configures the DCMIPP Exposure Shift Red This parameter can be one value between 0 and 7

- ***uint8_t DCMIPP_ExposureConfTypeDef::MultiplierRed***
  Configures the DCMIPP Exposure Multiplier Red This parameter can be one value between 0 and 127
- ***uint8_t DCMIPP_ExposureConfTypeDef::ShiftGreen***
  Configures the DCMIPP Exposure Shift Green This parameter can be one value between 0 and 7
- ***uint8_t DCMIPP_ExposureConfTypeDef::MultiplierGreen***
  Configures the DCMIPP Exposure Multiplier Green This parameter can be one value between 0 and 127
- ***uint8_t DCMIPP_ExposureConfTypeDef::ShiftBlue***
  Configures the DCMIPP Exposure Shift Blue This parameter can be one value between 0 and 7
- ***uint8_t DCMIPP_ExposureConfTypeDef::MultiplierBlue***
  Configures the DCMIPP Exposure Multiplier Blue This parameter can be one value between 0 and 127

16.1.15 DCMIPP_ContrastConfTypeDef

DCMIPP_ContrastConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint8_t LUM_0***
- ***uint8_t LUM_32***
- ***uint8_t LUM_64***
- ***uint8_t LUM_96***
- ***uint8_t LUM_128***
- ***uint8_t LUM_160***
- ***uint8_t LUM_192***
- ***uint8_t LUM_224***
- ***uint8_t LUM_256***

Field Documentation

- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_0***
  Luminance increase for input luminance of 0 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_32***
  Luminance increase for input luminance of 32 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_64***
  Luminance increase for input luminance of 64 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_96***
  Luminance increase for input luminance of 96 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_128***
  Luminance increase for input luminance of 128 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_160***
  Luminance increase for input luminance of 160 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_192***
  Luminance increase for input luminance of 192 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_224***
  Luminance increase for input luminance of 224 This parameter can be one value between 0 and 31
- ***uint8_t DCMIPP_ContrastConfTypeDef::LUM_256***
  Luminance increase for input luminance of 256 This parameter can be one value between 0 and 31

16.1.16 DCMIPP_RawBayer2RGBConfTypeDef

DCMIPP_RawBayer2RGBConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VLineStrength***
- ***uint32_t HLineStrength***
- ***uint32_t RawBayerType***
- ***uint32_t PeakStrength***
- ***uint32_t EdgeStrength***

Field Documentation

- ***uint32_t DCMIPP_RawBayer2RGBConfTypeDef::VLineStrength***
  Strength of the vertical line detection This parameter can be a value from ***DCMIPP_RAWBayer2RGB_Strength***
- ***uint32_t DCMIPP_RawBayer2RGBConfTypeDef::HLineStrength***
  Strength of the horizontal line detection This parameter can be a value from ***DCMIPP_RAWBayer2RGB_Strength***
- ***uint32_t DCMIPP_RawBayer2RGBConfTypeDef::RawBayerType***
  Raw Bayer type This parameter can be a value from ***DCMIPP_RAWBayer2RGB_Type***
- ***uint32_t DCMIPP_RawBayer2RGBConfTypeDef::PeakStrength***
  Strength of the peak detection This parameter can be a value from ***DCMIPP_RAWBayer2RGB_Strength***
- ***uint32_t DCMIPP_RawBayer2RGBConfTypeDef::EdgeStrength***
  Strength of the edge detection This parameter can be a value from ***DCMIPP_RAWBayer2RGB_Strength***

16.1.17 DCMIPP_ColorConversionConfTypeDef

DCMIPP_ColorConversionConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***FunctionalState ClampOutputSamples***
- ***uint8_t OutputSamplesType***
- ***int16_t RR***
- ***int16_t RG***
- ***int16_t RB***
- ***int16_t RA***
- ***int16_t GR***
- ***int16_t GG***
- ***int16_t GB***
- ***int16_t GA***
- ***int16_t BR***
- ***int16_t BG***
- ***int16_t BB***
- ***int16_t BA***

Field Documentation

- ***FunctionalState DCMIPP_ColorConversionConfTypeDef::ClampOutputSamples***
  Clamp the output samples depending on type This parameter can be ENABLE or DISABLE
- ***uint8_t DCMIPP_ColorConversionConfTypeDef::OutputSamplesType***
  Output samples type used while clamp is activated This parameter can be a value from ***DCMIPP_OutputSamplesType***
- ***int16_t DCMIPP_ColorConversionConfTypeDef::RR***
  Coefficient Row 1 Column 1 of the matrix This parameter can be a value from -1023 to 1023
- ***int16_t DCMIPP_ColorConversionConfTypeDef::RG***
  Coefficient Row 1 Column 2 of the matrix This parameter can be a value from -1023 to 1023
- ***int16_t DCMIPP_ColorConversionConfTypeDef::RB***
  Coefficient Row 1 Column 3 of the matrix This parameter can be a value from -511 to 511
- ***int16_t DCMIPP_ColorConversionConfTypeDef::RA***
  Coefficient Row 1 of the added Column This parameter can be a value from -511 to 511
- ***int16_t DCMIPP_ColorConversionConfTypeDef::GR***
  Coefficient Row 2 Column 1 of the matrix This parameter can be a value from -1023 to 1023
- ***int16_t DCMIPP_ColorConversionConfTypeDef::GG***
  Coefficient Row 2 Column 2 of the matrix This parameter can be a value from -1023 to 1023
- ***int16_t DCMIPP_ColorConversionConfTypeDef::GB***
  Coefficient Row 2 Column 3 of the matrix This parameter can be a value from -511 to 511
- ***int16_t DCMIPP_ColorConversionConfTypeDef::GA***
  Coefficient Row 2 of the added Column This parameter can be a value from -511 to 511
- ***int16_t DCMIPP_ColorConversionConfTypeDef::BR***
  Coefficient Row 3 Column 1 of the matrix This parameter can be a value from -1023 to 1023

- ***int16_t DCMIPP_ColorConversionConfTypeDef::BG***
  Coefficient Row 3 Column 2 of the matrix This parameter can be a value -1023 to 1023
- ***int16_t DCMIPP_ColorConversionConfTypeDef::BB***
  Coefficient Row 3 Column 3 of the matrix This parameter can be a value from -511 to 511
- ***int16_t DCMIPP_ColorConversionConfTypeDef::BA***
  Coefficient Row 3 of the added Column This parameter can be a value from -511 to 511

16.1.18 DCMIPP_RegionOfInterestConfTypeDef

DCMIPP_RegionOfInterestConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VStart***
- ***uint32_t HStart***
- ***uint32_t VSize***
- ***uint32_t HSize***
- ***uint32_t LineSizeWidth***
- ***uint32_t RegionOfInterest***
- ***uint8_t ColorLineRed***
- ***uint8_t ColorLineGreen***
- ***uint8_t ColorLineBlue***

Field Documentation

- ***uint32_t DCMIPP_RegionOfInterestConfTypeDef::VStart***
  Configures the DCMIPP Region Of Interest Vertical Start This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_RegionOfInterestConfTypeDef::HStart***
  Configures the DCMIPP Region Of Interest Horizontal Start This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_RegionOfInterestConfTypeDef::VSize***
  Configures the DCMIPP Region Of Interest Vertical Size This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_RegionOfInterestConfTypeDef::HSize***
  Configures the DCMIPP Region Of Interest Horizontal Size This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_RegionOfInterestConfTypeDef::LineSizeWidth***
  Configures the DCMIPP Region Of Interest Line Size Width This parameter can be a value from ***DCMIPP_Region_Of_Interest_Line_Width***
- ***uint32_t DCMIPP_RegionOfInterestConfTypeDef::RegionOfInterest***
  Configures the DCMIPP Region Of Interest This parameter can be a value from ***DCMIPP_Region_Of_Interest***
- ***uint8_t DCMIPP_RegionOfInterestConfTypeDef::ColorLineRed***
  Configures the DCMIPP Region Of Interest Line Color : Red Component This parameter can be one value between 0 and 4095
- ***uint8_t DCMIPP_RegionOfInterestConfTypeDef::ColorLineGreen***
  Configures the DCMIPP Region Of Interest Line Color : Green Component This parameter can be one value between 0 and 4095
- ***uint8_t DCMIPP_RegionOfInterestConfTypeDef::ColorLineBlue***
  Configures the DCMIPP Region Of Interest Line Color : Blue Component This parameter can be one value between 0 and 4095

16.1.19 DCMIPP_BlackLevelConfTypeDef

DCMIPP_BlackLevelConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint8_t RedCompBlackLevel***
- ***uint8_t GreenCompBlackLevel***
- ***uint8_t BlueCompBlackLevel***

Field Documentation

- ***uint8_t DCMIPP_BlackLevelConfTypeDef::RedCompBlackLevel***
  Black value register to red component This parameter can be one value between 0 and 255
- ***uint8_t DCMIPP_BlackLevelConfTypeDef::GreenCompBlackLevel***
  Black value register to green component This parameter can be one value between 0 and 255
- ***uint8_t DCMIPP_BlackLevelConfTypeDef::BlueCompBlackLevel***
  Black value register to blue component This parameter can be one value between 0 and 255

16.1.20 DCMIPP_DownsizeTypeDef

DCMIPP_DownsizeTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VSize***
- ***uint32_t HSize***
- ***uint32_t VRatio***
- ***uint32_t HRatio***
- ***uint32_t VDivFactor***
- ***uint32_t HDivFactor***

Field Documentation

- ***uint32_t DCMIPP_DownsizeTypeDef::VSize***
  Configures the DCMIPP Downsize Vertical Size This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_DownsizeTypeDef::HSize***
  Configures the DCMIPP Downsize Horizontal Size This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_DownsizeTypeDef::VRatio***
  Configures the DCMIPP Downsize Vertical Ratio This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_DownsizeTypeDef::HRatio***
  Configures the DCMIPP Downsize Horizontal Ratio This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_DownsizeTypeDef::VDivFactor***
  Configures the DCMIPP Downsize Vertical Division Factor This parameter can be one value between 0 and 4095
- ***uint32_t DCMIPP_DownsizeTypeDef::HDivFactor***
  Configures the DCMIPP Downsize Horizontal Division Factor This parameter can be one value between 0 and 4095

16.1.21 DCMIPP_DecimationConfTypeDef

DCMIPP_DecimationConfTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t VRatio***
- ***uint32_t HRatio***

Field Documentation

- ***uint32_t DCMIPP_DecimationConfTypeDef::VRatio***
  Configures the DCMIPP Downsize Vertical Size This parameter can be a value from ***DCMIPP_PIPE_Vertical_Decimation_Ratio***
- ***uint32_t DCMIPP_DecimationConfTypeDef::HRatio***
  Configures the DCMIPP Downsize Vertical Size This parameter can be a value from ***DCMIPP_PIPE_Horizontal_Decimation_Ratio***

16.1.22 DCMIPP_SemiPlanarDstAddressTypeDef

DCMIPP_SemiPlanarDstAddressTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t YAddress***
- ***uint32_t UVAddress***

Field Documentation

- ***uint32_t DCMIPP_SemiPlanarDstAddressTypeDef::YAddress***
  Y Frame Buffer address
- ***uint32_t DCMIPP_SemiPlanarDstAddressTypeDef::UVAddress***
  UV Frame Buffer address

16.1.23 DCMIPP_FullPlanarDstAddressTypeDef

DCMIPP_FullPlanarDstAddressTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***uint32_t YAddress***
- ***uint32_t UAddress***
- ***uint32_t VAddress***

Field Documentation

- ***uint32_t DCMIPP_FullPlanarDstAddressTypeDef::YAddress***
  Y Frame Buffer address
- ***uint32_t DCMIPP_FullPlanarDstAddressTypeDef::UAddress***
  U Frame Buffer address
- ***uint32_t DCMIPP_FullPlanarDstAddressTypeDef::VAddress***
  V Frame Buffer address

16.1.24 __DCMIPP_HandleTypeDef

__DCMIPP_HandleTypeDef is defined in the stm32n6xx_hal_dcmipp.h

Data Fields

- ***DCMIPP_TypeDef * Instance***
- ***__IO HAL_DCMIPP_StateTypeDef State***
- ***__IO HAL_DCMIPP_PipeStateTypeDef PipeState***
- ***__IO uint32_t ErrorCode***
- ***void(* PIPE_FrameEventCallback***
- ***void(* PIPE_VsyncEventCallback***
- ***void(* PIPE_LineEventCallback***
- ***void(* PIPE_LimitEventCallback***

16.2 DCMIPP Firmware driver API description

The following section lists the various functions of the DCMIPP library.

16.2.1 How to use this driver

The sequence below describes how to use this driver to capture image from a camera module connected to the DCMIPP Interface. This sequence does not take into account the configuration of the camera module, which should be made before to configure and enable the DCMIPP to capture images. Initialize the DCMIPP and the CSI through HAL_DCMIPP_Init() function.

Mandatory Configuration

Interrupt mode IO operation

DCMIPP HAL driver macros list

Below the list of most used macros in DCMIPP HAL driver :

- __HAL_DCMIPP_GET_FLAG: Get the DCMIPP pending flags.
- __HAL_DCMIPP_CLEAR_FLAG: Clear the DCMIPP pending flags.
- __HAL_DCMIPP_ENABLE_IT: Enable the specified DCMIPP interrupts.
- __HAL_DCMIPP_DISABLE_IT: Disable the specified DCMIPP interrupts.
- __HAL_DCMIPP_GET_IT_SOURCE: Check whether the specified DCMIPP interrupt is enabled or not.
- __HAL_DCMIPP_CSI_GET_FLAG: Get the CSI pending flags.
- __HAL_DCMIPP_CSI_CLEAR_FLAG: Clear the CSI pending flags.
- __HAL_DCMIPP_CSI_ENABLE_IT: Enable the specified CSI interrupts.
- __HAL_DCMIPP_CSI_DISABLE_IT: Disable the specified CSI interrupts.
- __HAL_DCMIPP_CSI_GET_IT_SOURCE: Check whether the specified CSI interrupt is enabled or not.

Callback registration

1. The compilation define USE_HAL_DCMIPP_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.
   – Use function HAL_DCMIPP_RegisterCallback() to register a user callback.
   – Use function HAL_DCMIPP_PIPE_RegisterCallback() to register a user pipe callback.
2. Function HAL_DCMIPP_RegisterCallback() allows to register following callbacks:
   – ErrorCallback : callback for Error
   – MspInitCallback : DCMIPP MspInit.
   – MspDeInitCallback : DCMIPP MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Function HAL_DCMIPP_PIPE_RegisterCallback() allows to register following callbacks:
   – PIPE_FrameEventCallback : callback for Pipe Frame Event.
   – PIPE_VsyncEventCallback : callback for Pipe Vsync Event.
   – PIPE_LineEventCallback : callback for Pipe Line Event.
   – PIPE_LimitEventCallback : callback for Pipe Limit Event.
   – PIPE_ErrorCallback : callback for Pipe Error This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
4. Use function HAL_DCMIPP_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_DCMIPP_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
   – ErrorCallback : callback for Error
   – MspInitCallback : DCMIPP MspInit.
   – MspDeInitCallback : DCMIPP MspDeInit.
5. Use function HAL_DCMIPP_PIPE_UnRegisterCallback() to reset a pipe callback to the default weak (surcharged) function. HAL_DCMIPP_PIPE_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
   – PIPE_FrameEventCallback : callback for Pipe Frame Event.
   – PIPE_VsyncEventCallback : callback for Pipe Vsync Event.
   – PIPE_LineEventCallback : callback for Pipe Line Event.
   – PIPE_LimitEventCallback : callback for Pipe Limit Event.
   – PIPE_ErrorCallback : callback for Pipe Error

6. By default, after the HAL_DCMIPP_Init and if the state is HAL_DCMIPP_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples PipeFrameEventCallback(), PipeVsyncEventCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_DCMIPP_Init and HAL_DCMIPP_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the HAL_DCMIPP_Init and HAL_DCMIPP_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand).
7. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_DCMIPP_RegisterCallback before calling HAL_DCMIPP_DeInit or HAL_DCMIPP_Init function.
8. When The compilation define USE_HAL_DCMIPP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

Note: You can refer to the DCMIPP HAL driver header file for more useful macros

16.2.2 Detailed description of functions

HAL_DCMIPP_Init

Function name

HAL_StatusTypeDef HAL_DCMIPP_Init (DCMIPP_HandleTypeDef * hdcmipp)

Function description

HAL_DCMIPP_DeInit

Function name

HAL_StatusTypeDef HAL_DCMIPP_DeInit (DCMIPP_HandleTypeDef * hdcmipp)

Function description

HAL_DCMIPP_MspInit

Function name

void HAL_DCMIPP_MspInit (DCMIPP_HandleTypeDef * hdcmipp)

Function description

HAL_DCMIPP_MspDeInit

Function name

void HAL_DCMIPP_MspDeInit (DCMIPP_HandleTypeDef * hdcmipp)

Function description

HAL_DCMIPP_PARALLEL_SetConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_PARALLEL_SetConfig (DCMIPP_HandleTypeDef * hdcmipp, const DCMIPP_ParallelConfTypeDef * pParallelConfig)

Function description

HAL_DCMIPP_CSI_PIPE_SetConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_PIPE_SetConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, const DCMIPP_CSI_PIPE_ConfTypeDef * pCSI_PipeConfig)

Function description

HAL_DCMIPP_CSI_SetConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_SetConfig (DCMIPP_HandleTypeDef * hdcmipp, const DCMIPP_CSI_ConfTypeDef * pCSI_Config)

Function description

HAL_DCMIPP_CSI_SetVCFilteringConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_SetVCFilteringConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t VirtualChannel, const DCMIPP_CSI_VCFilteringConfTypeDef * pVCFilteringConfig)

Function description

HAL_DCMIPP_CSI_SetVCConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_SetVCConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t VirtualChannel, uint32_t DataTypeFormat)

Function description

HAL_DCMIPP_PIPE_SetConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_SetConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, const DCMIPP_PipeConfTypeDef * pPipeConfig)

Function description

HAL_DCMIPP_SetIPPlugConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_SetIPPlugConfig (DCMIPP_HandleTypeDef * hdcmipp, const DCMIPP_IPPlugConfTypeDef * pIPPlugConfig)

Function description

HAL_DCMIPP_PIPE_Start

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_Start (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t DstAddress, uint32_t CaptureMode)

Function description

HAL_DCMIPP_PIPE_DoubleBufferStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_DoubleBufferStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t DstAddress0, uint32_t DstAddress1, uint32_t CaptureMode)

Function description

HAL_DCMIPP_CSI_PIPE_Start

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_PIPE_Start (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t VirtualChannel, uint32_t DstAddress, uint32_t CaptureMode)

Function description

HAL_DCMIPP_CSI_PIPE_DoubleBufferStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_PIPE_DoubleBufferStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t VirtualChannel, uint32_t DstAddress0, uint32_t DstAddress1, uint32_t CaptureMode)

Function description

HAL_DCMIPP_PIPE_SemiPlanarStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_SemiPlanarStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, DCMIPP_SemiPlanarDstAddressTypeDef * pSemiPlanarDstAddress, uint32_t CaptureMode)

Function description

HAL_DCMIPP_PIPE_SemiPlanarDoubleBufferStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_SemiPlanarDoubleBufferStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, DCMIPP_SemiPlanarDstAddressTypeDef * pSemiPlanarDstAddress0, DCMIPP_SemiPlanarDstAddressTypeDef * pSemiPlanarDstAddress1, uint32_t CaptureMode)

Function description

HAL_DCMIPP_PIPE_FullPlanarStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_FullPlanarStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, DCMIPP_FullPlanarDstAddressTypeDef * pFullPlanarDstAddress, uint32_t CaptureMode)

Function description

HAL_DCMIPP_PIPE_FullPlanarDoubleBufferStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_FullPlanarDoubleBufferStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, DCMIPP_FullPlanarDstAddressTypeDef * pFullPlanarDstAddress0, DCMIPP_FullPlanarDstAddressTypeDef * pFullPlanarDstAddress1, uint32_t CaptureMode)

Function description

HAL_DCMIPP_CSI_PIPE_SemiPlanarStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_PIPE_SemiPlanarStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t VirtualChannel, DCMIPP_SemiPlanarDstAddressTypeDef * pSemiPlanarDstAddress, uint32_t CaptureMode)

Function description

HAL_DCMIPP_CSI_PIPE_SemiPlanarDoubleBufferStart

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_PIPE_SemiPlanarDoubleBufferStart (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t VirtualChannel, DCMIPP_SemiPlanarDstAddressTypeDef * pSemiPlanarDstAddress0, DCMIPP_SemiPlanarDstAddressTypeDef * pSemiPlanarDstAddress1, uint32_t CaptureMode)

Function description

HAL_DCMIPP_PIPE_CSI_EnableHeader

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_CSI_EnableHeader (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_CSI_DisableHeader

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_CSI_DisableHeader (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PARALLEL_SetSyncUnmask

Function name

HAL_StatusTypeDef HAL_DCMIPP_PARALLEL_SetSyncUnmask (DCMIPP_HandleTypeDef * hdcmipp, const DCMIPP_EmbeddedSyncUnmaskTypeDef * SyncUnmask)

Function description

HAL_DCMIPP_CSI_SetLineByteCounterConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_SetLineByteCounterConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Counter, const DCMIPP_CSI_LineByteCounterConfTypeDef * pLineByteConfig)

Function description

HAL_DCMIPP_CSI_EnableLineByteCounter

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_EnableLineByteCounter (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Counter)

Function description

HAL_DCMIPP_CSI_DisableLineByteCounter

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_DisableLineByteCounter (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Counter)

Function description

HAL_DCMIPP_CSI_SetTimerConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_SetTimerConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Timer, const DCMIPP_CSI_TimerConfTypeDef * TimerConfig)

Function description

HAL_DCMIPP_CSI_EnableTimer

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_EnableTimer (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Timer)

Function description

HAL_DCMIPP_CSI_DisableTimer

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_DisableTimer (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Timer)

Function description

HAL_DCMIPP_CSI_SetWatchdogCounterConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_CSI_SetWatchdogCounterConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Counter)

Function description

HAL_DCMIPP_PIPE_EnableComponentsSwap

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_EnableComponentsSwap (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_DisableComponentsSwap

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_DisableComponentsSwap (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_DisableRedBlueSwap

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_DisableRedBlueSwap (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_EnableRedBlueSwap

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_EnableRedBlueSwap (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_DisableYUVSwap

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_DisableYUVSwap (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_EnableYUVSwap

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_EnableYUVSwap (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_SetFrameCounterConfig

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_SetFrameCounterConfig (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_ResetFrameCounter

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_ResetFrameCounter (DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_PIPE_ReadFrameCounter

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_ReadFrameCounter (const DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t * pCounter)

Function description

HAL_DCMIPP_PIPE_GetDataCounter

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_GetDataCounter (const DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t * pCounter)

Function description

HAL_DCMIPP_PIPE_GetISPRemovedBadPixelCounter

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_GetISPRemovedBadPixelCounter (const DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t * pCounter)

Function description

HAL_DCMIPP_PIPE_GetISPAccumulatedStatisticsCounter

Function name

HAL_StatusTypeDef HAL_DCMIPP_PIPE_GetISPAccumulatedStatisticsCounter (const DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint8_t ModuleID, uint32_t * pCounter)

Function description

HAL_DCMIPP_GetMode

Function name

uint32_t HAL_DCMIPP_GetMode (const DCMIPP_HandleTypeDef * hdcmipp)

Function description

HAL_DCMIPP_PIPE_GetMemoryAddress

Function name

uint32_t HAL_DCMIPP_PIPE_GetMemoryAddress (const DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe, uint32_t MemoryAddress)

Function description

HAL_DCMIPP_GetState

Function name

HAL_DCMIPP_StateTypeDef HAL_DCMIPP_GetState (const DCMIPP_HandleTypeDef * hdcmipp)

Function description

HAL_DCMIPP_PIPE_GetState

Function name

HAL_DCMIPP_PipeStateTypeDef HAL_DCMIPP_PIPE_GetState (const DCMIPP_HandleTypeDef * hdcmipp, uint32_t Pipe)

Function description

HAL_DCMIPP_GetError

Function name

uint32_t HAL_DCMIPP_GetError (const DCMIPP_HandleTypeDef * hdcmipp)

Function description

16.3 DCMIPP Firmware driver defines

The following section lists the various define and macros of the module.

16.3.1 DCMIPP

DCMIPP

DCMIPP Bad Pixel Removal Strength

DCMIPP_BAD_PXL_REM_SRENGTH_0

The filter is fairly tolerant: only a few pixels are declared bad, due to their high noise

DCMIPP_BAD_PXL_REM_SRENGTH_1

Bad Pixel detection strength 1

DCMIPP_BAD_PXL_REM_SRENGTH_2

Bad Pixel detection strength 2

DCMIPP_BAD_PXL_REM_SRENGTH_3

Bad Pixel detection strength 3

DCMIPP_BAD_PXL_REM_SRENGTH_4

Bad Pixel detection strength 4

DCMIPP_BAD_PXL_REM_SRENGTH_5

Bad Pixel detection strength 5

DCMIPP_BAD_PXL_REM_SRENGTH_6

Bad Pixel detection strength 6

DCMIPP_BAD_PXL_REM_SRENGTH_7

Bad Pixel detection strength 7

DCMIPP Byte Select Mode

DCMIPP_BSM_ALL

Interface captures all received data

DCMIPP_BSM_DATA_OUT_2

Interface captures 1 data out of 2

DCMIPP_BSM_BYTE_OUT_4

Interface captures 1 byte out of 4

DCMIPP_BSM_2BYTE_OUT_4

Interface captures 2 byte out of 4

DCMIPP Byte Start Mode

DCMIPP_OEBS_ODD

Interface captures first data (byte or double byte) from the frame/line start,second one being dropped

DCMIPP_OEBS_EVEN

Interface captures second data (byte or double byte) from the frame/line start, first one is dropped

DCMIPP Capture Mode

DCMIPP_MODE_CONTINUOUS

DCMIPP continuous mode (preview)

DCMIPP_MODE_SNAPSHOT

DCMIPP snapshot mode

DCMIPP Crop Area

DCMIPP_POSITIVE_AREA

Positive Area chosen for crop

DCMIPP_NEGATIVE_AREA

Negative Area chosen for crop

DCMIPP CSI Counter

DCMIPP_CSI_COUNTER0

DCMIPP CSI Counter 0

DCMIPP_CSI_COUNTER1

DCMIPP CSI Counter 1

DCMIPP_CSI_COUNTER2

DCMIPP CSI Counter 2

DCMIPP_CSI_COUNTER3

DCMIPP CSI Counter 3

DCMIPP CSI Data Lane

DCMIPP_CSI_DATA_LANE0

DCMIPP CSI Data Lane 0

DCMIPP_CSI_DATA_LANE1

DCMIPP CSI Data Lane 1

DCMIPP CSI Data Lane Mapping

DCMIPP_CSI_PHYSICAL_DATA_LANES

Physical data lane 0 connected to logical data lane 0 and Physical data lane 1 connected to logical data lane 1

DCMIPP_CSI_INVERTED_DATA_LANES

Physical data lane 1 connected to logical data lane 0 and Physical data lane 0 connected to logical data lane 1

DCMIPP CSI Data Type Format

DCMIPP_CSI_DT_BPP6

DCMIPP CSI Data Type Format 6 bit words

DCMIPP_CSI_DT_BPP7

DCMIPP CSI Data Type Format 7 bit words

DCMIPP_CSI_DT_BPP8

DCMIPP CSI Data Type Format 8 bit words

DCMIPP_CSI_DT_BPP10

DCMIPP CSI Data Type Format 10 bit words

DCMIPP_CSI_DT_BPP12

DCMIPP CSI Data Type Format 12 bit words

DCMIPP_CSI_DT_BPP14

DCMIPP CSI Data Type Format 14 bit words

DCMIPP_CSI_DT_BPP16

DCMIPP CSI Data Type Format 16 bit words

DCMIPP CSI Data Type ID

DCMIPP_CSI_DT1

DCMIPP Data Type ID 1

DCMIPP_CSI_DT2

DCMIPP Data Type ID 2

DCMIPP_CSI_DT3

DCMIPP Data Type ID 3

DCMIPP_CSI_DT4

DCMIPP Data Type ID 4

DCMIPP_CSI_DT5

DCMIPP Data Type ID 5

DCMIPP_CSI_DT6

DCMIPP Data Type ID 6

DCMIPP_CSI_DT7

DCMIPP Data Type ID 7

DCMIPP CSI Interrupt Flags

DCMIPP_CSI_FLAG_SYNCERR

Synchronization error flag

DCMIPP_CSI_FLAG_WDERR

Watchdog error flag

DCMIPP_CSI_FLAG_SPKTERR

Shorter packet than expected error flag

DCMIPP_CSI_FLAG_IDERR

Data ID information error flag

DCMIPP_CSI_FLAG_CECCERR

Corrected ECC error flag

DCMIPP_CSI_FLAG_ECCERR

ECC Error flag

DCMIPP_CSI_FLAG_CRCERR

CRC Error flag

DCMIPP_CSI_FLAG_CCFIFO

Clock changer FIFO full event flag

DCMIPP_CSI_FLAG_SPKT

Short packet detection flag

DCMIPP_CSI_FLAG_EOF3

EOF on virtual channel 3 flag

DCMIPP_CSI_FLAG_EOF2

EOF on virtual channel 2 flag

DCMIPP_CSI_FLAG_EOF1

EOF on virtual channel 1 flag

DCMIPP_CSI_FLAG_EOF0

EOF on virtual channel 0 flag

DCMIPP_CSI_FLAG_SOF3

SOF on virtual channel 3 flag

DCMIPP_CSI_FLAG_SOF2

SOF on virtual channel 2 flag

DCMIPP_CSI_FLAG_SOF1

SOF on virtual channel 1 flag

DCMIPP_CSI_FLAG_SOF0

SOF on virtual channel 0 flag

DCMIPP_CSI_FLAG_TIM3

Timer 3 counter value reached flag

DCMIPP_CSI_FLAG_TIM2

Timer 2 counter value reached flag

DCMIPP_CSI_FLAG_TIM1

Timer 1 counter value reached flag

DCMIPP_CSI_FLAG_TIM0

Timer 0 counter value reached flag

DCMIPP_CSI_FLAG_LB3

Line/byte event 3 reached flag

DCMIPP_CSI_FLAG_LB2

Line/byte event 2 reached flag

DCMIPP_CSI_FLAG_LB1

Line/byte event 1 reached flag

DCMIPP_CSI_FLAG_LB0

Line/byte event 0 reached flag

DCMIPP_CSI_FLAG_ECTRLDL1

Error control on data line 1 flag

DCMIPP_CSI_FLAG_ESYNCESCDL1

Low-power data transmission synchronization error on data line 1 flag

DCMIPP_CSI_FLAG_EESCDL1

Escape entry error on data line 1 flag

DCMIPP_CSI_FLAG_ESOTSYNCDL1

SOT synchronization error on data line 1 flag

DCMIPP_CSI_FLAG_ESOTDL1

SOT error on data line 1 flag

DCMIPP_CSI_FLAG_ECTRLDL0

Error control on data line 0 flag

DCMIPP_CSI_FLAG_ESYNCESCDL0

Low-power data transmission synchronization error on data line 0 flag

DCMIPP_CSI_FLAG_EESCDL0

Escape entry error on data line 0 flag

DCMIPP_CSI_FLAG_ESOTSYNCDL0

SOT synchronization error on data line 0 flag

DCMIPP_CSI_FLAG_ESOTDL0

SOT error on data line 0 flag

DCMIPP CSI Interrupt sources

DCMIPP_CSI_IT_SYNCERR

Synchronization error interrupt

DCMIPP_CSI_IT_WDERR

Watchdog error interrupt

DCMIPP_CSI_IT_SPKTERR

Shorter packet than expected error interrupt

DCMIPP_CSI_IT_IDERR

Data ID information error interrupt

DCMIPP_CSI_IT_CECCERR

Corrected ECC error interrupt

DCMIPP_CSI_IT_ECCERR

ECC Error interrupt

DCMIPP_CSI_IT_CRCERR

CRC Error interrupt

DCMIPP_CSI_IT_CCFIFO

Clock changer FIFO full event interrupt

DCMIPP_CSI_IT_SPKT

Short packet detection interrupt

DCMIPP_CSI_IT_EOF3

EOF on virtual channel 3 interrupt

DCMIPP_CSI_IT_EOF2

EOF on virtual channel 2 interrupt

DCMIPP_CSI_IT_EOF1

EOF on virtual channel 1 interrupt

DCMIPP_CSI_IT_EOF0

EOF on virtual channel 0 interrupt

DCMIPP_CSI_IT_SOF3

SOF on virtual channel 3 interrupt

DCMIPP_CSI_IT_SOF2

SOF on virtual channel 2 interrupt

DCMIPP_CSI_IT_SOF1

SOF on virtual channel 1 interrupt

DCMIPP_CSI_IT_SOF0

SOF on virtual channel 0 interrupt

DCMIPP_CSI_IT_TIM3

Timer 3 counter value reached interrupt

DCMIPP_CSI_IT_TIM2

Timer 2 counter value reached interrupt

DCMIPP_CSI_IT_TIM1

Timer 1 counter value reached interrupt

DCMIPP_CSI_IT_TIM0

Timer 0 counter value reached interrupt

DCMIPP_CSI_IT_LB3

Line/byte event 3 reached interrupt

DCMIPP_CSI_IT_LB2

Line/byte event 2 reached interrupt

DCMIPP_CSI_IT_LB1

Line/byte event 1 reached interrupt

DCMIPP_CSI_IT_LB0

Line/byte event 0 reached interrupt

DCMIPP_CSI_IT_ECTRLDL1

Error control on data line 1 interrupt

DCMIPP_CSI_IT_ESYNCESCDL1

Low-power data transmission synchronization error on data line 1 interrupt

DCMIPP_CSI_IT_EESCDL1

Escape entry error on data line 1 interrupt

DCMIPP_CSI_IT_ESOTSYNCDL1

SOT synchronization error on data line 1 interrupt

DCMIPP_CSI_IT_ESOTDL1

SOT error on data line 1 interrupt

DCMIPP_CSI_IT_ECTRLDL0

Error control on data line 0 interrupt

DCMIPP_CSI_IT_ESYNCESCDL0

Low-power data transmission synchronization error on data line 0 interrupt

DCMIPP_CSI_IT_EESCDL0

Escape entry error on data line 0 interrupt

DCMIPP_CSI_IT_ESOTSYNCDL0

SOT synchronization error on data line 0 interrupt

DCMIPP_CSI_IT_ESOTDL0

SOT error on data line 0 interrupt

DCMIPP CSI Number Of Lanes

DCMIPP_CSI_ONE_DATA_LANE

DCMIPP CSI One Data Lane

DCMIPP_CSI_TWO_DATA_LANES

DCMIPP CSI 2 Data Lanes

DCMIPP CSI PHY BitRate

DCMIPP_CSI_PHY_BT_80

HAL_DCMIPP_CSI_ERROR_DPHY_ESCAPE

Escape Entry Error on data line (0 OR 1)

HAL_DCMIPP_CSI_ERROR_SOT_SYNC

SOT Synchronisation Error on data line(0 OR 1)

HAL_DCMIPP_CSI_ERROR_SOT

SOT Error on data line (0 OR 1)

DCMIPP Exported Macros

__HAL_DCMIPP_ENABLE_IT

Description:

- Enable the specified DCMIPP interrupts.

Parameters:

- __HANDLE__: DCMIPP handle
- __INTERRUPT__: specifies the DCMIPP interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMIPP_IT_AXI_TRANSFER_ERR IPPLUG AXI Transfer error interrupt
  - DCMIPP_IT_PARALLEL_SYNC_ERR Synchronization error interrupt on parallel interface
  - DCMIPP_IT_PIPE0_FRAME Frame capture complete interrupt for the pipe0
  - DCMIPP_IT_PIPE0_VSYNC Vertical sync interrupt for the pipe0
  - DCMIPP_IT_PIPE0_LINE Multi-line capture complete interrupt for the pipe0
  - DCMIPP_IT_PIPE0_LIMIT Limit interrupt for the pipe0
  - DCMIPP_IT_PIPE0_OVR Overrun interrupt for the pipe0
  - DCMIPP_IT_PIPE1_LINE Multi-line capture complete interrupt for the pipe1
  - DCMIPP_IT_PIPE1_FRAME Frame capture complete interrupt for the pipe1
  - DCMIPP_IT_PIPE1_VSYNC Vertical sync interrupt for the pipe1
  - DCMIPP_IT_PIPE1_OVR Overrun interrupt for the pipe1
  - DCMIPP_IT_PIPE2_LINE Multi-line capture complete interrupt for the pipe2
  - DCMIPP_IT_PIPE2_FRAME Frame capture complete interrupt for the pipe2
  - DCMIPP_IT_PIPE2_VSYNC Vertical sync interrupt for the pipe2
  - DCMIPP_IT_PIPE2_OVR Overrun interrupt for the pipe2

Return value:

- None

__HAL_DCMIPP_DISABLE_IT

Description:

- Disable the specified DCMIPP interrupts.

Parameters:

- __HANDLE__: DCMIPP handle
- __INTERRUPT__: specifies the DCMIPP interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DCMIPP_IT_AXI_TRANSFER_ERR IPPLUG AXI Transfer error interrupt
  - DCMIPP_IT_PARALLEL_SYNC_ERR Synchronization error interrupt on parallel interface
  - DCMIPP_IT_PIPE0_FRAME Frame capture complete interrupt for the pipe0
  - DCMIPP_IT_PIPE0_VSYNC Vertical sync interrupt for the pipe0
  - DCMIPP_IT_PIPE0_LINE Multi-line capture complete interrupt for the pipe0
  - DCMIPP_IT_PIPE0_LIMIT Limit interrupt for the pipe0
  - DCMIPP_IT_PIPE0_OVR Overrun interrupt for the pipe0
  - DCMIPP_IT_PIPE1_LINE Multi-line capture complete interrupt for the pipe1
  - DCMIPP_IT_PIPE1_FRAME Frame capture complete interrupt for the pipe1
  - DCMIPP_IT_PIPE1_VSYNC Vertical sync interrupt for the pipe1
  - DCMIPP_IT_PIPE1_OVR Overrun interrupt for the pipe1
  - DCMIPP_IT_PIPE2_LINE Multi-line capture complete interrupt for the pipe2
  - DCMIPP_IT_PIPE2_FRAME Frame capture complete interrupt for the pipe2
  - DCMIPP_IT_PIPE2_VSYNC Vertical sync interrupt for the pipe2
  - DCMIPP_IT_PIPE2_OVR Overrun interrupt for the pipe2

Return value:

- None

__HAL_DCMIPP_GET_FLAG

Description:

- Get the DCMIPP pending interrupt flags.

Parameters:

- __HANDLE__: DCMIPP handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - DCMIPP_FLAG_AXI_TRANSFER_ERR IPPLUG AXI Transfer error interrupt flag
  - DCMIPP_FLAG_PARALLEL_SYNC_ERR Synchronization error interrupt flag on parallel interface
  - DCMIPP_FLAG_PIPE0_FRAME Frame capture complete interrupt flag for the pipe0
  - DCMIPP_FLAG_PIPE0_VSYNC Vertical sync interrupt flag for the pipe0
  - DCMIPP_FLAG_PIPE0_LINE Multi-line capture complete interrupt flag for the pipe0
  - DCMIPP_FLAG_PIPE0_LIMIT Limit interrupt flag for the pipe0
  - DCMIPP_FLAG_PIPE0_OVR Overrun interrupt flag for the pipe0
  - DCMIPP_FLAG_PIPE1_LINE Multi-line capture complete interrupt flag for the pipe1
  - DCMIPP_FLAG_PIPE1_FRAME Frame capture complete interrupt flag for the pipe1
  - DCMIPP_FLAG_PIPE1_VSYNC Vertical sync interrupt flag for the pipe1
  - DCMIPP_FLAG_PIPE1_OVR Overrun interrupt flag for the pipe1
  - DCMIPP_FLAG_PIPE2_LINE Multi-line capture complete interrupt flag for the pipe2
  - DCMIPP_FLAG_PIPE2_FRAME Frame capture complete interrupt flag for the pipe2
  - DCMIPP_FLAG_PIPE2_VSYNC Vertical sync interrupt flag for the pipe2
  - DCMIPP_FLAG_PIPE2_OVR Overrun interrupt flag for the pipe2

Return value:

- The: state of FLAG (SET or RESET).

__HAL_DCMIPP_CLEAR_FLAG

Description:

- Clear the DCMIPP pending interrupt flags.

Parameters:

- __HANDLE__: DCMIPP handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DCMIPP_FLAG_AXI_TRANSFER_ERR IPPLUG AXI Transfer error interrupt
  - DCMIPP_FLAG_PARALLEL_SYNC_ERR Synchronization error interrupt on parallel interface
  - DCMIPP_FLAG_PIPE0_FRAME Frame capture complete interrupt for the pipe0
  - DCMIPP_FLAG_PIPE0_VSYNC Vertical sync interrupt for the pipe0
  - DCMIPP_FLAG_PIPE0_LINE Multi-line capture complete interrupt for the pipe0
  - DCMIPP_FLAG_PIPE0_LIMIT Limit interrupt for the pipe0
  - DCMIPP_FLAG_PIPE0_OVR Overrun interrupt for the pipe0
  - DCMIPP_FLAG_PIPE1_LINE Multi-line capture complete interrupt for the pipe1
  - DCMIPP_FLAG_PIPE1_FRAME Frame capture complete interrupt for the pipe1
  - DCMIPP_FLAG_PIPE1_VSYNC Vertical sync interrupt for the pipe1
  - DCMIPP_FLAG_PIPE1_OVR Overrun interrupt for the pipe1
  - DCMIPP_FLAG_PIPE2_LINE Multi-line capture complete interrupt for the pipe2
  - DCMIPP_FLAG_PIPE2_FRAME Frame capture complete interrupt for the pipe2
  - DCMIPP_FLAG_PIPE2_VSYNC Vertical sync interrupt for the pipe2
  - DCMIPP_FLAG_PIPE2_OVR Overrun interrupt for the pipe2

Return value:

- None

__HAL_DCMIPP_GET_IT_SOURCE

Description:

- Checks whether the specified DCMIPP interrupt is enabled or not.

Parameters:

- __HANDLE__: DCMIPP handle
- __INTERRUPT__: specifies the DCMIPP interrupt sources to be checked. This parameter can be any combination of the following values:
  - DCMIPP_IT_AXI_TRANSFER_ERR IPPLUG AXI Transfer error interrupt
  - DCMIPP_IT_PARALLEL_SYNC_ERR Synchronization error interrupt on parallel interface
  - DCMIPP_IT_PIPE0_FRAME Frame capture complete interrupt for the pipe0
  - DCMIPP_IT_PIPE0_VSYNC Vertical sync interrupt for the pipe0
  - DCMIPP_IT_PIPE0_LINE Multi-line capture complete interrupt for the pipe0
  - DCMIPP_IT_PIPE0_LIMIT Limit interrupt for the pipe0
  - DCMIPP_IT_PIPE0_OVR Overrun interrupt for the pipe0
  - DCMIPP_IT_PIPE1_LINE Multi-line capture complete interrupt for the pipe1
  - DCMIPP_IT_PIPE1_FRAME Frame capture complete interrupt for the pipe1
  - DCMIPP_IT_PIPE1_VSYNC Vertical sync interrupt for the pipe1
  - DCMIPP_IT_PIPE1_OVR Overrun interrupt for the pipe1
  - DCMIPP_IT_PIPE2_LINE Multi-line capture complete interrupt for the pipe2
  - DCMIPP_IT_PIPE2_FRAME Frame capture complete interrupt for the pipe2
  - DCMIPP_IT_PIPE2_VSYNC Vertical sync interrupt for the pipe2
  - DCMIPP_IT_PIPE2_OVR Overrun interrupt for the pipe2

Return value:

- The: state of DCMIPP interrupt (SET or RESET).

__HAL_DCMIPP_CSI_ENABLE_IT

Description:

- Enable the specified DCMIPP CSI interrupts.

Parameters:

- __HANDLE__: CSI handle
- __INTERRUPT__: specifies the DCMIPP CSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMIPP_CSI_IT_SYNCERR Synchronization error interrupt
  - DCMIPP_CSI_IT_WDERR Watchdog error interrupt
  - DCMIPP_CSI_IT_SPKTERR Shorter packet than expected error interrupt
  - DCMIPP_CSI_IT_IDERR Data ID information error interrupt
  - DCMIPP_CSI_IT_CECCERR Corrected ECC error interrupt
  - DCMIPP_CSI_IT_ECCERR ECC Error interrupt
  - DCMIPP_CSI_IT_CRCERR CRC Error interrupt
  - DCMIPP_CSI_IT_CCFIFO Clock changer FIFO full event interrupt
  - DCMIPP_CSI_IT_SPKT Short packet detection interrupt
  - DCMIPP_CSI_IT_EOF3 EOF on virtual channel 3 interrupt
  - DCMIPP_CSI_IT_EOF2 EOF on virtual channel 2 interrupt
  - DCMIPP_CSI_IT_EOF1 EOF on virtual channel 1 interrupt
  - DCMIPP_CSI_IT_EOF0 EOF on virtual channel 0 interrupt
  - DCMIPP_CSI_IT_SOF3 SOF on virtual channel 3 interrupt
  - DCMIPP_CSI_IT_SOF2 SOF on virtual channel 2 interrupt
  - DCMIPP_CSI_IT_SOF1 SOF on virtual channel 1 interrupt
  - DCMIPP_CSI_IT_SOF0 SOF on virtual channel 0 interrupt
  - DCMIPP_CSI_IT_TIM3 Timer 3 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM2 Timer 2 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM1 Timer 1 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM0 Timer 0 counter value reached interrupt
  - DCMIPP_CSI_IT_LB3 Line/byte event 3 reached interrupt
  - DCMIPP_CSI_IT_LB2 Line/byte event 2 reached interrupt
  - DCMIPP_CSI_IT_LB1 Line/byte event 1 reached interrupt
  - DCMIPP_CSI_IT_LB0 Line/byte event 0 reached interrupt

Return value:

- None

__HAL_DCMIPP_CSI_DISABLE_IT

Description:

- Disable the specified DCMIPP CSI interrupts.

Parameters:

- __HANDLE__: CSI handle
- __INTERRUPT__: specifies the DCMIPP CSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMIPP_CSI_IT_SYNCERR Synchronization error interrupt
  - DCMIPP_CSI_IT_WDERR Watchdog error interrupt
  - DCMIPP_CSI_IT_SPKTERR Shorter packet than expected error interrupt
  - DCMIPP_CSI_IT_IDERR Data ID information error interrupt
  - DCMIPP_CSI_IT_CECCERR Corrected ECC error interrupt
  - DCMIPP_CSI_IT_ECCERR ECC Error interrupt
  - DCMIPP_CSI_IT_CRCERR CRC Error interrupt
  - DCMIPP_CSI_IT_CCFIFO Clock changer FIFO full event interrupt
  - DCMIPP_CSI_IT_SPKT Short packet detection interrupt
  - DCMIPP_CSI_IT_EOF3 EOF on virtual channel 3 interrupt
  - DCMIPP_CSI_IT_EOF2 EOF on virtual channel 2 interrupt
  - DCMIPP_CSI_IT_EOF1 EOF on virtual channel 1 interrupt
  - DCMIPP_CSI_IT_EOF0 EOF on virtual channel 0 interrupt
  - DCMIPP_CSI_IT_SOF3 SOF on virtual channel 3 interrupt
  - DCMIPP_CSI_IT_SOF2 SOF on virtual channel 2 interrupt
  - DCMIPP_CSI_IT_SOF1 SOF on virtual channel 1 interrupt
  - DCMIPP_CSI_IT_SOF0 SOF on virtual channel 0 interrupt
  - DCMIPP_CSI_IT_TIM3 Timer 3 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM2 Timer 2 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM1 Timer 1 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM0 Timer 0 counter value reached interrupt
  - DCMIPP_CSI_IT_LB3 Line/byte event 3 reached interrupt
  - DCMIPP_CSI_IT_LB2 Line/byte event 2 reached interrupt
  - DCMIPP_CSI_IT_LB1 Line/byte event 1 reached interrupt
  - DCMIPP_CSI_IT_LB0 Line/byte event 0 reached interrupt

Return value:

- None

__HAL_DCMIPP_CSI_GET_FLAG

Description:

- Get the DCMIPP CSI pending interrupt flags.

Parameters:

- __HANDLE__: CSI handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - DCMIPP_CSI_FLAG_SYNCERR Synchronization error flag
  - DCMIPP_CSI_FLAG_WDERR Watchdog error flag
  - DCMIPP_CSI_FLAG_SPKTERR Shorter packet than expected error flag
  - DCMIPP_CSI_FLAG_IDERR Data ID information error flag
  - DCMIPP_CSI_FLAG_CECCERR Corrected ECC error flag
  - DCMIPP_CSI_FLAG_ECCERR ECC Error flag
  - DCMIPP_CSI_FLAG_CRCERR CRC Error flag
  - DCMIPP_CSI_FLAG_CCFIFO Clock changer FIFO full event flag
  - DCMIPP_CSI_FLAG_SPKT Short packet detection flag
  - DCMIPP_CSI_FLAG_EOF3 EOF on virtual channel 3 flag
  - DCMIPP_CSI_FLAG_EOF2 EOF on virtual channel 2 flag
  - DCMIPP_CSI_FLAG_EOF1 EOF on virtual channel 1 flag
  - DCMIPP_CSI_FLAG_EOF0 EOF on virtual channel 0 flag
  - DCMIPP_CSI_FLAG_SOF3 SOF on virtual channel 3 flag
  - DCMIPP_CSI_FLAG_SOF2 SOF on virtual channel 2 flag
  - DCMIPP_CSI_FLAG_SOF1 SOF on virtual channel 1 flag
  - DCMIPP_CSI_FLAG_SOF0 SOF on virtual channel 0 flag
  - DCMIPP_CSI_FLAG_TIM3 Timer 3 counter value reached flag
  - DCMIPP_CSI_FLAG_TIM2 Timer 2 counter value reached flag
  - DCMIPP_CSI_FLAG_TIM1 Timer 1 counter value reached flag
  - DCMIPP_CSI_FLAG_TIM0 Timer 0 counter value reached flag
  - DCMIPP_CSI_FLAG_LB3 Line/byte event 3 reached flag
  - DCMIPP_CSI_FLAG_LB2 Line/byte event 2 reached flag
  - DCMIPP_CSI_FLAG_LB1 Line/byte event 1 reached flag
  - DCMIPP_CSI_FLAG_LB0 Line/byte event 0 reached flag

Return value:

- None

__HAL_DCMIPP_CSI_CLEAR_FLAG

Description:

- Clear the DCMIPP CSI pending interrupt flags.

Parameters:

- __HANDLE__: CSI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DCMIPP_CSI_FLAG_SYNCERR Synchronization error flag
  - DCMIPP_CSI_FLAG_WDERR Watchdog error flag
  - DCMIPP_CSI_FLAG_SPKTERR Shorter packet than expected error flag
  - DCMIPP_CSI_FLAG_IDERR Data ID information error flag
  - DCMIPP_CSI_FLAG_CECCERR Corrected ECC error flag
  - DCMIPP_CSI_FLAG_ECCERR ECC Error flag
  - DCMIPP_CSI_FLAG_CRCERR CRC Error flag
  - DCMIPP_CSI_FLAG_CCFIFO Clock changer FIFO full event flag
  - DCMIPP_CSI_FLAG_SPKT Short packet detection flag
  - DCMIPP_CSI_FLAG_EOF3 EOF on virtual channel 3 flag
  - DCMIPP_CSI_FLAG_EOF2 EOF on virtual channel 2 flag
  - DCMIPP_CSI_FLAG_EOF1 EOF on virtual channel 1 flag
  - DCMIPP_CSI_FLAG_EOF0 EOF on virtual channel 0 flag
  - DCMIPP_CSI_FLAG_SOF3 SOF on virtual channel 3 flag
  - DCMIPP_CSI_FLAG_SOF2 SOF on virtual channel 2 flag
  - DCMIPP_CSI_FLAG_SOF1 SOF on virtual channel 1 flag
  - DCMIPP_CSI_FLAG_SOF0 SOF on virtual channel 0 flag
  - DCMIPP_CSI_FLAG_TIM3 Timer 3 counter value reached flag
  - DCMIPP_CSI_FLAG_TIM2 Timer 2 counter value reached flag
  - DCMIPP_CSI_FLAG_TIM1 Timer 1 counter value reached flag
  - DCMIPP_CSI_FLAG_TIM0 Timer 0 counter value reached flag
  - DCMIPP_CSI_FLAG_LB3 Line/byte event 3 reached flag
  - DCMIPP_CSI_FLAG_LB2 Line/byte event 2 reached flag
  - DCMIPP_CSI_FLAG_LB1 Line/byte event 1 reached flag
  - DCMIPP_CSI_FLAG_LB0 Line/byte event 0 reached flag

Return value:

- None

__HAL_DCMIPP_CSI_GET_IT_SOURCE

Description:

- Checks whether the specified DCMIPP interrupt is enabled or not.

Parameters:

- __HANDLE__: DCMIPP handle
- __INTERRUPT__: specifies the DCMIPP interrupt sources to be checked. This parameter can be any combination of the following values:
  - DCMIPP_CSI_IT_SYNCERR Synchronization error interrupt
  - DCMIPP_CSI_IT_WDERR Watchdog error interrupt
  - DCMIPP_CSI_IT_SPKTERR Shorter packet than expected error interrupt
  - DCMIPP_CSI_IT_IDERR Data ID information error interrupt
  - DCMIPP_CSI_IT_CECCERR Corrected ECC error interrupt
  - DCMIPP_CSI_IT_ECCERR ECC Error interrupt
  - DCMIPP_CSI_IT_CRCERR CRC Error interrupt
  - DCMIPP_CSI_IT_CCFIFO Clock changer FIFO full event interrupt
  - DCMIPP_CSI_IT_SPKT Short packet detection interrupt
  - DCMIPP_CSI_IT_EOF3 EOF on virtual channel 3 interrupt
  - DCMIPP_CSI_IT_EOF2 EOF on virtual channel 2 interrupt
  - DCMIPP_CSI_IT_EOF1 EOF on virtual channel 1 interrupt
  - DCMIPP_CSI_IT_EOF0 EOF on virtual channel 0 interrupt
  - DCMIPP_CSI_IT_SOF3 SOF on virtual channel 3 interrupt
  - DCMIPP_CSI_IT_SOF2 SOF on virtual channel 2 interrupt
  - DCMIPP_CSI_IT_SOF1 SOF on virtual channel 1 interrupt
  - DCMIPP_CSI_IT_SOF0 SOF on virtual channel 0 interrupt
  - DCMIPP_CSI_IT_TIM3 Timer 3 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM2 Timer 2 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM1 Timer 1 counter value reached interrupt
  - DCMIPP_CSI_IT_TIM0 Timer 0 counter value reached interrupt
  - DCMIPP_CSI_IT_LB3 Line/byte event 3 reached interrupt
  - DCMIPP_CSI_IT_LB2 Line/byte event 2 reached interrupt
  - DCMIPP_CSI_IT_LB1 Line/byte event 1 reached interrupt
  - DCMIPP_CSI_IT_LB0 Line/byte event 0 reached interrupt

Return value:

- The: state of DCMIPP interrupt (SET or RESET).

__HAL_DCMIPP_CSI_DPHY_ENABLE_IT

Description:

- Enable the specified DCMIPP CSI DPHY interrupts.

Parameters:

- __HANDLE__: CSI handle
- __INTERRUPT__: specifies the DCMIPP CSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMIPP_CSI_IT_ECTRLDL1 Error control on data line 1 interrupt
  - DCMIPP_CSI_IT_ESYNCESCDL1 Low-power data transmission synchronization error on data line 1 interrupt
  - DCMIPP_CSI_IT_EESCDL1 Escape entry error on data line 1 interrupt
  - DCMIPP_CSI_IT_ESOTSYNCDL1 SOT synchronization error on data line 1 interrupt
  - DCMIPP_CSI_IT_ESOTDL1 SOT error on data line 1 interrupt
  - DCMIPP_CSI_IT_ECTRLDL0 Error control on data line 0 interrupt
  - DCMIPP_CSI_IT_ESYNCESCDL0 Low-power data transmission synchronization error on data line 0 interrupt
  - DCMIPP_CSI_IT_EESCDL0 Escape entry error on data line 0 interrupt
  - DCMIPP_CSI_IT_ESOTSYNCDL0 SOT synchronization error on data line 0 interrupt
  - DCMIPP_CSI_IT_ESOTDL0 SOT error on data line 0 interrupt

Return value:

- None

__HAL_DCMIPP_CSI_DPHY_DISABLE_IT

Description:

- Disable the specified DCMIPP CSI DPHY interrupts.

Parameters:

- __HANDLE__: CSI handle
- __INTERRUPT__: specifies the DCMIPP CSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMIPP_CSI_IT_ECTRLDL1 Error control on data line 1 interrupt
  - DCMIPP_CSI_IT_ESYNCESCDL1 Low-power data transmission synchronization error on data line 1 interrupt
  - DCMIPP_CSI_IT_EESCDL1 Escape entry error on data line 1 interrupt
  - DCMIPP_CSI_IT_ESOTSYNCDL1 SOT synchronization error on data line 1 interrupt
  - DCMIPP_CSI_IT_ESOTDL1 SOT error on data line 1 interrupt
  - DCMIPP_CSI_IT_ECTRLDL0 Error control on data line 0 interrupt
  - DCMIPP_CSI_IT_ESYNCESCDL0 Low-power data transmission synchronization error on data line 0 interrupt
  - DCMIPP_CSI_IT_EESCDL0 Escape entry error on data line 0 interrupt
  - DCMIPP_CSI_IT_ESOTSYNCDL0 SOT synchronization error on data line 0 interrupt
  - DCMIPP_CSI_IT_ESOTDL0 SOT error on data line 0 interrupt

Return value:

- None

__HAL_DCMIPP_CSI_GET_DPHY_FLAG

Description:

- Get the DCMIPP CSI DPHY pending interrupt flags.

Parameters:

- __HANDLE__: CSI handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - DCMIPP_CSI_FLAG_ECTRLDL1 Error control on data line 1 flag
  - DCMIPP_CSI_FLAG_ESYNCESCDL1 Low-power data transmission synchronization error on data line 1 flag
  - DCMIPP_CSI_FLAG_EESCDL1 Escape entry error on data line 1 flag
  - DCMIPP_CSI_FLAG_ESOTSYNCDL1 SOT synchronization error on data line 1 flag
  - DCMIPP_CSI_FLAG_ESOTDL1 SOT error on data line 1 flag
  - DCMIPP_CSI_FLAG_ECTRLDL0 Error control on data line 0 flag
  - DCMIPP_CSI_FLAG_ESYNCESCDL0 Low-power data transmission synchronization error on data line 0 flag
  - DCMIPP_CSI_FLAG_EESCDL0 Escape entry error on data line 0 flag
  - DCMIPP_CSI_FLAG_ESOTSYNCDL0 SOT synchronization error on data line 0 flag
  - DCMIPP_CSI_FLAG_ESOTDL0 SOT error on data line 0 flag

Return value:

- None

__HAL_DCMIPP_CSI_CLEAR_DPHY_FLAG

Description:

- Clear the DCMIPP CSI DPHY pending interrupt flags.

Parameters:

- __HANDLE__: CSI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DCMIPP_CSI_FLAG_ECTRLDL1 Error control on data line 1 flag
  - DCMIPP_CSI_FLAG_ESYNCESCDL1 Low-power data transmission synchronization error on data line 1 flag
  - DCMIPP_CSI_FLAG_EESCDL1 Escape entry error on data line 1 flag
  - DCMIPP_CSI_FLAG_ESOTSYNCDL1 SOT synchronization error on data line 1 flag
  - DCMIPP_CSI_FLAG_ESOTDL1 SOT error on data line 1 flag
  - DCMIPP_CSI_FLAG_ECTRLDL0 Error control on data line 0 flag
  - DCMIPP_CSI_FLAG_ESYNCESCDL0 Low-power data transmission synchronization error on data line 0 flag
  - DCMIPP_CSI_FLAG_EESCDL0 Escape entry error on data line 0 flag
  - DCMIPP_CSI_FLAG_ESOTSYNCDL0 SOT synchronization error on data line 0 flag
  - DCMIPP_CSI_FLAG_ESOTDL0 SOT error on data line 0 flag

Return value:

- None

__HAL_DCMIPP_CSI_GET_DPHY_IT_SOURCE

Description:

- Checks whether the specified DCMIPP CSI DPHY interrupt is enabled or not.

Parameters:

- __HANDLE__: CSI handle
- __INTERRUPT__: specifies the DCMIPP CSI D-PHY interrupt sources to be checked. This parameter can be any combination of the following values:
  - DCMIPP_CSI_IT_ECTRLDL1 Error control on data line 1 interrupt
  - DCMIPP_CSI_IT_ESYNCESCDL1 Low-power data transmission synchronization error on data line 1 interrupt
  - DCMIPP_CSI_IT_EESCDL1 Escape entry error on data line 1 interrupt
  - DCMIPP_CSI_IT_ESOTSYNCDL1 SOT synchronization error on data line 1 interrupt
  - DCMIPP_CSI_IT_ESOTDL1 SOT error on data line 1 interrupt
  - DCMIPP_CSI_IT_ECTRLDL0 Error control on data line 0 interrupt
  - DCMIPP_CSI_IT_ESYNCESCDL0 Low-power data transmission synchronization error on data line 0 interrupt
  - DCMIPP_CSI_IT_EESCDL0 Escape entry error on data line 0 interrupt
  - DCMIPP_CSI_IT_ESOTSYNCDL0 SOT synchronization error on data line 0 interrupt
  - DCMIPP_CSI_IT_ESOTDL0 SOT error on data line 0 interrupt

Return value:

- None

DCMIPP Format 14-bits

DCMIPP Frame Rates

DCMIPP_FRAME_RATE_ALL

All frames captured

DCMIPP_FRAME_RATE_1_OVER_2

1 frame over 2 captured

DCMIPP_FRAME_RATE_1_OVER_4

1 frame over 4 captured

DCMIPP_FRAME_RATE_1_OVER_8

1 frame over 8 captured

DCMIPP HSYNC Polarity

DCMIPP_HSPOLARITY_LOW

Horizontal synchronization active Low

DCMIPP_HSPOLARITY_HIGH

Horizontal synchronization active High

DCMIPP Interrupt Flags

DCMIPP_FLAG_AXI_TRANSFER_ERROR

IPPLUG AXI Transfer error interrupt flag

DCMIPP_FLAG_PARALLEL_SYNC_ERROR

Synchronization error interrupt on parallel interface flag

DCMIPP_FLAG_PIPE0_FRAME

Frame capture interrupt complete for pipe0 flag

DCMIPP_FLAG_PIPE0_VSYNC

Vertical synch interrupt for pipe0 flag

DCMIPP_FLAG_PIPE0_LINE

Multiline interrupt for pipe0 flag

DCMIPP_FLAG_PIPE0_LIMIT

Limit interrupt for pipe0 flag

DCMIPP_FLAG_PIPE0_OVR

Overrun interrupt for pipe0 flag

DCMIPP_FLAG_PIPE1_LINE

Multiline capture interrupt for pipe1 flag

DCMIPP_FLAG_PIPE1_FRAME

Frame capture interrupt complete for pipe1 flag

DCMIPP_FLAG_PIPE1_VSYNC

Vertical synch interrupt for pipe1 flag

DCMIPP_FLAG_PIPE1_OVR

Overrun interrupt for pipe1 flag

DCMIPP_FLAG_PIPE2_LINE

Multiline capture interrupt for pipe2 flag

DCMIPP_FLAG_PIPE2_FRAME

Frame capture interrupt complete for pipe2 flag

DCMIPP_FLAG_PIPE2_VSYNC

Vertical synch interrupt for pipe2 flag

DCMIPP_FLAG_PIPE2_OVR

Overrun interrupt for pipe2 flag

DCMIPP Interrupt sources

DCMIPP_IT_AXI_TRANSFER_ERROR

IPPLUG AXI Transfer error interrupt

DCMIPP_IT_PARALLEL_SYNC_ERROR

Sync error interrupt on parallel interface

DCMIPP_IT_PIPE0_FRAME

Frame capture interrupt complete for pipe0

DCMIPP_IT_PIPE0_VSYNC

Vertical sync interrupt for pipe0

DCMIPP_IT_PIPE0_LINE

Multiline interrupt for pipe0

DCMIPP_IT_PIPE0_LIMIT

Limit interrupt for pipe0

DCMIPP_IT_PIPE0_OVR

Overrun interrupt for pipe0

DCMIPP_IT_PIPE1_LINE

Multiline capture interrupt for pipe1

DCMIPP_IT_PIPE1_FRAME

Frame capture interrupt complete for pipe1

DCMIPP_IT_PIPE1_VSYNC

Vertical sync interrupt for pipe1

DCMIPP_IT_PIPE1_OVR

Overrun interrupt for pipe1

DCMIPP_IT_PIPE2_LINE

Multiline capture interrupt for pipe2

DCMIPP_IT_PIPE2_FRAME

Frame capture interrupt complete for pipe2

DCMIPP_IT_PIPE2_VSYNC

Vertical synch interrupt for pipe2

DCMIPP_IT_PIPE2_OVR

Overrun interrupt for pipe2

DCMIPP IPPLUG Client

DCMIPP_CLIENT1

Client 1 identifier

DCMIPP_CLIENT2

Client 2 identifier

DCMIPP_CLIENT3

Client 3 identifier

DCMIPP_CLIENT4

Client 4 identifier

DCMIPP_CLIENT5

Client 5 identifier

DCMIPP Line Mult

DCMIPP_MULTILINE_1_LINE

Event after every 1 line

DCMIPP_MULTILINE_2_LINES

Event after every 2 lines

DCMIPP_MULTILINE_4_LINES

Event after every 4 lines

DCMIPP_MULTILINE_8_LINES

Event after every 8 lines

DCMIPP_MULTILINE_16_LINES

Event after every 16 lines

DCMIPP_MULTILINE_32_LINES

Event after every 32 lines

DCMIPP_MULTILINE_64_LINES

Event after every 64 lines

DCMIPP_MULTILINE_128_LINES

Event after every 128 lines

DCMIPP line Wrap Address

DCMIPP_WRAP_ADDRESS_1_LINE

Wraps address after 1 line

DCMIPP_WRAP_ADDRESS_2_LINES

Wraps address after 2 lines

DCMIPP_WRAP_ADDRESS_4_LINES

Wraps address after 4 lines

DCMIPP_WRAP_ADDRESS_8_LINES

Wraps address after 8 lines

DCMIPP_WRAP_ADDRESS_16_LINES

Wraps address after 16 lines

DCMIPP_WRAP_ADDRESS_32_LINES

Wraps address after 32 lines

DCMIPP_WRAP_ADDRESS_64_LINES

Wraps address after 64 lines

DCMIPP_WRAP_ADDRESS_128_LINES

Wraps address after 128 lines

DCMIPP Line Select Mode

DCMIPP_LSM_ALL

Interface captures all received lines

DCMIPP_LSM_ALTERNATE_2

Interface captures one line out of two

DCMIPP Line Start Mode

DCMIPP_OELS_ODD

Interface captures first line from the frame start, second one is dropped

DCMIPP_OELS_EVEN

Interface captures second line from the frame start, first one is dropped

DCMIPP Maximum Outstanding Transactions

DCMIPP_OUTSTANDING_TRANSACTION_NONE

Nooutstanding transaction limitation

DCMIPP_OUTSTANDING_TRANSACTION_2

Two outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_3

Three outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_4

Four outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_5

5 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_6

6 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_7

7 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_8

8 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_9

9 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_10

10 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_11

11 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_12

12 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_13

13 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_14

14 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_15

15 outstanding transactions

DCMIPP_OUTSTANDING_TRANSACTION_16

16 outstanding transactions

DCMIPP Memory

DCMIPP_MEMORY_ADDRESS_0

Base destination address

DCMIPP_MEMORY_ADDRESS_1

Second destination address

DCMIPP Memory Page Size

DCMIPP_MEMORY_PAGE_SIZE_64BYTES

Memory Page size 64 Bytes

DCMIPP_MEMORY_PAGE_SIZE_128BYTES

Memory Page size 128 Bytes

DCMIPP_MEMORY_PAGE_SIZE_256BYTES

Memory Page size 256 Bytes

DCMIPP_MEMORY_PAGE_SIZE_512BYTES

Memory Page size 512 Bytes

DCMIPP_MEMORY_PAGE_SIZE_1KBYTES

Memory Page size 1 Bytes

DCMIPP_MEMORY_PAGE_SIZE_2KBYTES

Memory Page size 2 Bytes

DCMIPP_MEMORY_PAGE_SIZE_4KBYTES

Memory Page size 4 Bytes

DCMIPP_MEMORY_PAGE_SIZE_8KBYTES

Memory Page size 8 Bytes

(DCMI or CSI): modes are exclusive

DCMIPP_PARALLEL_MODE

DCMIPP Parallel (DCMI) mode

DCMIPP_SERIAL_MODE

DCMIPP CSI mode

DCMIPP Multiply

DCMIPP_MULTIPY_BY_1

DCMIPP multiply R/G/B by 1

DCMIPP_MULTIPY_BY_2

DCMIPP multiply R/G/B by 2

DCMIPP_MULTIPY_BY_4

DCMIPP multiply R/G/B by 4

DCMIPP_MULTIPY_BY_8

DCMIPP multiply R/G/B by 8

DCMIPP OutputSamplesType

DCMIPP_CLAMP_YUV

Output samples type : Clamped to [16;235] for Y and to [16;240] for U and V

DCMIPP_CLAMP_RGB

Output samples type:Clamped to [16;235] for R, G and B

DCMIPP Pipes

DCMIPP_PIPE0

DCMIPP Pipe0 (Dump pipe)

DCMIPP_PIPE1

DCMIPP Pipe1 (Main Pipe)

DCMIPP_PIPE2

DCMIPP Pipe2 (Ancillary pipe)

DCMIPP Pipe Horizontal Decimation Ratio

DCMIPP_HDEC_ALL

All pixels captured , no horizontal decimation

DCMIPP_HDEC_1_OUT_2

One line out of two transmitted

DCMIPP_HDEC_1_OUT_4

One line out of four transmitted

DCMIPP_HDEC_1_OUT_8

One line out of eight transmitted

DCMIPP Pipe Vertical Decimation Ratio

DCMIPP_VDEC_ALL

All lines captured , no vertical decimation

DCMIPP_VDEC_1_OUT_2

One line out of two transmitted

DCMIPP_VDEC_1_OUT_4

One line out of four transmitted

DCMIPP_VDEC_1_OUT_8

One line out of eight transmitted

DCMIPP PIXCK Polarity

DCMIPP_PCKPOLARITY_FALLING

Pixel clock active on Falling edge

DCMIPP_PCKPOLARITY_RISING

Pixel clock active on Rising edge

DCMIPP Pixel Packer Format

DCMIPP_PIXEL_PACKER_FORMAT_RGB888_YUV444_1

RGB888 or YUV422 1-buffer

DCMIPP_PIXEL_PACKER_FORMAT_RGB565_1

RGB565 1-buffer

DCMIPP_PIXEL_PACKER_FORMAT_ARGB8888

ARGB888 A=0xff

DCMIPP_PIXEL_PACKER_FORMAT_RGBA888

RGBA888 A=0xff)

DCMIPP_PIXEL_PACKER_FORMAT_MONO_Y8_G8_1

Monochrome Y8 or G8

DCMIPP_PIXEL_PACKER_FORMAT_YUV444_1

YUV444 1-buffer 32bpp A=0xff)

DCMIPP_PIXEL_PACKER_FORMAT_YUV422_1

YUV422 1-buffer 16bpp

DCMIPP_PIXEL_PACKER_FORMAT_YUV422_2

YUV422 2-buffer 16bpp

DCMIPP_PIXEL_PACKER_FORMAT_YUV420_2

YUV420 2-buffer 12bpp

DCMIPP_PIXEL_PACKER_FORMAT_YUV420_3

YUV420 3-buffer 12bpp

DCMIPP RAWBayer2RGB Strength

DCMIPP_RAWBAYER_ALGO_NONE

No edge detection, pure linear interpolation

DCMIPP_RAWBAYER_ALGO_STRENGTH_3

RawBayer relative algorithm strength 3

DCMIPP_RAWBAYER_ALGO_STRENGTH_4

RawBayer relative algorithm strength 4

DCMIPP_RAWBAYER_ALGO_STRENGTH_6

RawBayer relative algorithm strength 6

DCMIPP_RAWBAYER_ALGO_STRENGTH_8

RawBayer relative algorithm strength 8

DCMIPP_RAWBAYER_ALGO_STRENGTH_12

RawBayer relative algorithm strength 12

DCMIPP_RAWBAYER_ALGO_STRENGTH_16

RawBayer relative algorithm strength 16

DCMIPP_RAWBAYER_ALGO_STRENGTH_24

RawBayer relative algorithm strength 24

DCMIPP RAWBayer2RGB Type

DCMIPP_RAWBAYER_RGGB

Raw Bayer Type RGGB

DCMIPP_RAWBAYER_GRBG

Raw Bayer Type GRBG

DCMIPP_RAWBAYER_GBRG

Raw Bayer Type GBRG

DCMIPP_RAWBAYER_BGGR

Raw Bayer Type BGGR

DCMIPP Region Of Interest

DCMIPP_REGION_OF_INTEREST1

Region Of Interest 1

DCMIPP_REGION_OF_INTEREST2

Region Of Interest 2

DCMIPP_REGION_OF_INTEREST3

Region Of Interest 3

DCMIPP_REGION_OF_INTEREST4

Region Of Interest 4

DCMIPP_REGION_OF_INTEREST5

Region Of Interest 5

DCMIPP_REGION_OF_INTEREST6

Region Of Interest 6

DCMIPP_REGION_OF_INTEREST7

Region Of Interest 7

DCMIPP_REGION_OF_INTEREST8

Region Of Interest 8

DCMIPP Region Of Interest Line Width

DCMIPP_LINE_WIDTH_1PXL

Line width 1 pixel

DCMIPP_LINE_WIDTH_2PXL

Line width 2 pixels

DCMIPP_LINE_WIDTH_4PXL

Line width 4 pixels

DCMIPP_LINE_WIDTH_8PXL

Line width 8 pixels

DCMIPP Statistics extraction Bins

DCMIPP_STAT_EXT_BINS_MODE_LOWER_BINS

LowerBins: Accu0 (1, 2) is incremented of 256 if Component <4 (<8, <16)

DCMIPP_STAT_EXT_BINS_MODE_LOWMID_BINS

LowMid Bins: Accu0 (1, 2) is incremented of 256 if Component <32 (<64, <128)

DCMIPP_STAT_EXT_BINS_MODE_UPMID_BINS

UpMid Bins: Accu0 (1, 2) is incremented of 256 if Component >127 (>191, >224)

DCMIPP_STAT_EXT_BINS_MODE_UP_BINS

UpBins: Accu0 (1, 2) is incremented of 256 if Component >239 (>247, >251) Condition: MODE = Average

DCMIPP_STAT_EXT_AVER_MODE_ALL_PIXELS

All Pixels: Accu is incremented of Component, if 0 <= Component < 256

DCMIPP_STAT_EXT_AVER_MODE_NOEXT16

NoExt16: Accu is incremented of Component, if 16 <= Component < 240

DCMIPP_STAT_EXT_AVER_MODE_NOEXT32

NoExt32: Accu is incremented of Component, if 32 <= Component < 224

DCMIPP_STAT_EXT_AVER_MODE_NOEXT64

NoExt64: Accu is incremented of Component, if 64 <= Component < 192

DCMIPP Statistics extraction Mode

DCMIPP_STAT_EXT_MODE_AVERAGE

Values of pixels are accumulated as-is

DCMIPP_STAT_EXT_MODE_BINS

Values of pixels are used to see if the pixel fits one of the 12 bins.

DCMIPP Statistics Extraction Module ID

DCMIPP_STATEXT_MODULE1

Statistic Extraction Module 1

DCMIPP_STATEXT_MODULE2

Statistic Extraction Module 2

DCMIPP_STATEXT_MODULE3

Statistic Extraction Module 3

DCMIPP Statistics extraction Source

DCMIPP_STAT_EXT_SOURCE_PRE_BLKLVL_R

Statistics Extraction Source : Red is sampled before the black level calibration and exposure

DCMIPP_STAT_EXT_SOURCE_PRE_BLKLVL_G

Statistics Extraction Source : Green is sampled before the black level calibration and exposure

DCMIPP_STAT_EXT_SOURCE_PRE_BLKLVL_B

Statistics Extraction Source : Blue is sampled before the black level calibration and exposure

DCMIPP_STAT_EXT_SOURCE_PRE_BLKLVL_L

Statistics Extraction Source : Luminance is sampled before the black level calibration and exposure

DCMIPP_STAT_EXT_SOURCE_POST_DEMOS_R

Statistics Extraction Source : Red is sampled after the black level calibration and exposure

DCMIPP_STAT_EXT_SOURCE_POST_DEMOS_G

Statistics Extraction Source : Green is sampled after the black level calibration and exposure

DCMIPP_STAT_EXT_SOURCE_POST_DEMOS_B

Statistics Extraction Source : Blue is sampled after the black level calibration and exposure

DCMIPP_STAT_EXT_SOURCE_POST_DEMOS_L

Statistics Extraction Source : Luminance is sampled after the black level calibration and exposure

DCMIPP Swap Bits

DCMIPP_SWAPBITS_DISABLE

swap lsb vs msb within each received component

DCMIPP_SWAPBITS_ENABLE

swap lsb vs msb within each received component

DCMIPP Swap Component

DCMIPP_SWAP_COMPONENT_DISABLE

Disable Swap R/U and B/V

DCMIPP_SWAP_COMPONENT_ENABLE

Enable Swap R/U and B/V

DCMIPP Swap Cycles

DCMIPP_SWAPCYCLES_DISABLE

swap data from cycle 0 vs cycle 1

DCMIPP_SWAPCYCLES_ENABLE

swap data from cycle 0 vs cycle 1

DCMIPP Synchronization Mode

DCMIPP_SYNCHRO_HARDWARE

Hardware Synchronization

DCMIPP_SYNCHRO_EMBEDDED

Embedded Synchronization

DCMIPP Traffic Burst Size

DCMIPP_TRAFFIC_BURST_SIZE_8BYTES

Traffic Burst size 8 Bytes

DCMIPP_TRAFFIC_BURST_SIZE_16BYTES

Traffic Burst size 16 Bytes

DCMIPP_TRAFFIC_BURST_SIZE_32BYTES

Traffic Burst size 32 Bytes

DCMIPP_TRAFFIC_BURST_SIZE_64BYTES

Traffic Burst size 64 Bytes

DCMIPP_TRAFFIC_BURST_SIZE_128BYTES

Traffic Burst size 128 Bytes

DCMIPP Virtual Channel

DCMIPP_VIRTUAL_CHANNEL0

DCMIPP Virtual Channel 0

DCMIPP_VIRTUAL_CHANNEL1

DCMIPP Virtual Channel 1

DCMIPP_VIRTUAL_CHANNEL2

DCMIPP Virtual Channel 2

DCMIPP_VIRTUAL_CHANNEL3

DCMIPP Virtual Channel 3

DCMIPP VSYNC Polarity

DCMIPP_VSPOLARITY_LOW

Vertical synchronization active Low

DCMIPP_VSPOLARITY_HIGH

Vertical synchronization active High

17 HAL DCMI Generic Driver

17.1 DCMI Firmware driver registers structures

17.1.1 DCMI_CodesInitTypeDef

DCMI_CodesInitTypeDef is defined in the stm32n6xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartCode***
- ***uint8_t LineStartCode***
- ***uint8_t LineEndCode***
- ***uint8_t FrameEndCode***

Field Documentation

- ***uint8_t DCMI_CodesInitTypeDef::FrameStartCode***
  Specifies the code of the frame start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineStartCode***
  Specifies the code of the line start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineEndCode***
  Specifies the code of the line end delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::FrameEndCode***
  Specifies the code of the frame end delimiter.

17.1.2 DCMI_SyncUnmaskTypeDef

DCMI_SyncUnmaskTypeDef is defined in the stm32n6xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartUnmask***
- ***uint8_t LineStartUnmask***
- ***uint8_t LineEndUnmask***
- ***uint8_t FrameEndUnmask***

Field Documentation

- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameStartUnmask***
  Specifies the frame start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineStartUnmask***
  Specifies the line start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineEndUnmask***
  Specifies the line end delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameEndUnmask***
  Specifies the frame end delimiter unmask.

17.1.3 DCMI_InitTypeDef

DCMI_InitTypeDef is defined in the stm32n6xx_hal_dcmi.h

Data Fields

- ***uint32_t SynchroMode***
- ***uint32_t PCKPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t HSPolarity***
- ***uint32_t CaptureRate***
- ***uint32_t ExtendedDataMode***
- ***DCMI_CodesInitTypeDef SyncroCode***
- ***uint32_t JPEGMode***
- ***uint32_t ByteSelectMode***

- *uint32_t ByteSelectStart*
- *uint32_t LineSelectMode*
- *uint32_t LineSelectStart*

Field Documentation

- ***uint32_t DCMI_InitTypeDef::SynchroMode***
  Specifies the Synchronization Mode: Hardware or Embedded. This parameter can be a value of *DCMI_Synchronization_Mode*
- ***uint32_t DCMI_InitTypeDef::PCKPolarity***
  Specifies the Pixel clock polarity: Falling or Rising. This parameter can be a value of *DCMI_PIXCK_Polarity*
- ***uint32_t DCMI_InitTypeDef::VSPolarity***
  Specifies the Vertical synchronization polarity: High or Low. This parameter can be a value of *DCMI_VSYNC_Polarity*
- ***uint32_t DCMI_InitTypeDef::HSPolarity***
  Specifies the Horizontal synchronization polarity: High or Low. This parameter can be a value of *DCMI_HSYNC_Polarity*
- ***uint32_t DCMI_InitTypeDef::CaptureRate***
  Specifies the frequency of frame capture: All, 1/2 or 1/4. This parameter can be a value of *DCMI_Capture_Rate*
- ***uint32_t DCMI_InitTypeDef::ExtendedDataMode***
  Specifies the data width: 8-bit, 10-bit, 12-bit or 14-bit. This parameter can be a value of *DCMI_Extended_Data_Mode*
- ***DCMI_CodesInitTypeDef DCMI_InitTypeDef::SyncroCode***
  Specifies the code of the line/frame start delimiter and the line/frame end delimiter
- ***uint32_t DCMI_InitTypeDef::JPEGMode***
  Enable or Disable the JPEG mode. This parameter can be a value of *DCMI_MODE_JPEG*
- ***uint32_t DCMI_InitTypeDef::ByteSelectMode***
  Specifies the data to be captured by the interface This parameter can be a value of *DCMI_Byte_Select_Mode*
- ***uint32_t DCMI_InitTypeDef::ByteSelectStart***
  Specifies if the data to be captured by the interface is even or odd This parameter can be a value of *DCMI_Byte_Select_Start*
- ***uint32_t DCMI_InitTypeDef::LineSelectMode***
  Specifies the line of data to be captured by the interface This parameter can be a value of *DCMI_Line_Select_Mode*
- ***uint32_t DCMI_InitTypeDef::LineSelectStart***
  Specifies if the line of data to be captured by the interface is even or odd This parameter can be a value of *DCMI_Line_Select_Start*

17.1.4 __DCMI_HandleTypeDef

__DCMI_HandleTypeDef is defined in the stm32n6xx_hal_dcmi.h

Data Fields

- *DCMI_TypeDef * Instance*
- *DCMI_InitTypeDef Init*
- *HAL_LockTypeDef Lock*
- *__IO HAL_DCMI_StateTypeDef State*
- *__IO uint32_t XferCount*
- *__IO uint32_t XferSize*
- *uint32_t XferTransferNumber*
- *uint32_t pBuffPtr*
- *DMA_HandleTypeDef * DMA_Handle*
- *__IO uint32_t ErrorCode*
- *void(* FrameEventCallback*
- *void(* VsyncEventCallback*

- ***void(* LineEventCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DCMI_TypeDef* __DCMI_HandleTypeDef::Instance***
  DCMI Register base address
- ***DCMI_InitTypeDef __DCMI_HandleTypeDef::Init***
  DCMI parameters
- ***HAL_LockTypeDef __DCMI_HandleTypeDef::Lock***
  DCMI locking object
- ***__IO HAL_DCMI_StateTypeDef __DCMI_HandleTypeDef::State***
  DCMI state
- ***__IO uint32_t __DCMI_HandleTypeDef::XferCount***
  DMA transfer counter
- ***__IO uint32_t __DCMI_HandleTypeDef::XferSize***
  DMA transfer size
- ***uint32_t __DCMI_HandleTypeDef::XferTransferNumber***
  DMA transfer number
- ***uint32_t __DCMI_HandleTypeDef::pBuffPtr***
  Pointer to DMA output buffer
- ***DMA_HandleTypeDef* __DCMI_HandleTypeDef::DMA_Handle***
  Pointer to the DMA handler
- ***__IO uint32_t __DCMI_HandleTypeDef::ErrorCode***
  DCMI Error code
- ***void(* __DCMI_HandleTypeDef::FrameEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Frame Event Callback
- ***void(* __DCMI_HandleTypeDef::VsyncEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Vsync Event Callback
- ***void(* __DCMI_HandleTypeDef::LineEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Line Event Callback
- ***void(* __DCMI_HandleTypeDef::ErrorCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Error Callback
- ***void(* __DCMI_HandleTypeDef::MspInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp Init callback
- ***void(* __DCMI_HandleTypeDef::MspDeInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp DeInit callback

17.2 DCMI Firmware driver API description

The following section lists the various functions of the DCMI library.

17.2.1 How to use this driver

The sequence below describes how to use this driver to capture image from a camera module connected to the DCMI Interface. This sequence does not take into account the configuration of the camera module, which should be made before to configure and enable the DCMI to capture images.

1. Program the required configuration through following parameters: horizontal and vertical polarity, pixel clock polarity, Capture Rate, Synchronization Mode, code of the frame delimiter and data width using HAL_DCMI_Init() function.
2. Configure the selected DMA stream to transfer Data from DCMI DR register to the destination memory buffer.
3. Program the required configuration through following parameters: DCMI mode, destination memory Buffer address and the data length and enable capture using HAL_DCMI_Start_DMA() function.
4. Optionally, configure and Enable the CROP feature to select a rectangular window from the received image using HAL_DCMI_ConfigCrop() and HAL_DCMI_EnableCrop() functions
5. The capture can be stopped using HAL_DCMI_Stop() function.

6. To control DCMI state you can use the function HAL_DCMI_GetState().

DCMI HAL driver macros list

Below the list of most used macros in DCMI HAL driver.

- __HAL_DCMI_ENABLE: Enable the DCMI peripheral.
- __HAL_DCMI_DISABLE: Disable the DCMI peripheral.
- __HAL_DCMI_GET_FLAG: Get the DCMI pending flags.
- __HAL_DCMI_CLEAR_FLAG: Clear the DCMI pending flags.
- __HAL_DCMI_ENABLE_IT: Enable the specified DCMI interrupts.
- __HAL_DCMI_DISABLE_IT: Disable the specified DCMI interrupts.
- __HAL_DCMI_GET_IT_SOURCE: Check whether the specified DCMI interrupt has occurred or not.

Note: You can refer to the DCMI HAL driver header file for more useful macros

Callback registration

17.2.2 Detailed description of functions

HAL_DCMI_Init

Function name

HAL_StatusTypeDef HAL_DCMI_Init (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_DeInit

Function name

HAL_StatusTypeDef HAL_DCMI_DeInit (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_MspInit

Function name

void HAL_DCMI_MspInit (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_MspDeInit

Function name

void HAL_DCMI_MspDeInit (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_RegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID, pDCMI_CallbackTypeDef pCallback)

Function description

HAL_DCMI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_UnRegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID)

Function description

HAL_DCMI_Start_DMA

Function name

HAL_StatusTypeDef HAL_DCMI_Start_DMA (DCMI_HandleTypeDef * hdcmi, uint32_t DCMI_Mode, uint32_t pData, uint32_t Length)

Function description

HAL_DCMI_Stop

Function name

HAL_StatusTypeDef HAL_DCMI_Stop (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_Suspend

Function name

HAL_StatusTypeDef HAL_DCMI_Suspend (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_Resume

Function name

HAL_StatusTypeDef HAL_DCMI_Resume (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_ErrorCallback

Function name

void HAL_DCMI_ErrorCallback (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_LineEventCallback

Function name

void HAL_DCMI_LineEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_FrameEventCallback

Function name

void HAL_DCMI_FrameEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_VsyncEventCallback

Function name

void HAL_DCMI_VsyncEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_IRQHandler

Function name

void HAL_DCMI_IRQHandler (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_ConfigCrop

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigCrop (DCMI_HandleTypeDef * hdcmi, uint32_t X0, uint32_t Y0, uint32_t XSize, uint32_t YSize)

Function description

HAL_DCMI_EnableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_EnableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_DisableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_DisableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_ConfigSyncUnmask

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigSyncUnmask (DCMI_HandleTypeDef * hdcmi, const DCMI_SyncUnmaskTypeDef * SyncUnmask)

Function description

HAL_DCMI_GetState

Function name

HAL_DCMI_StateTypeDef HAL_DCMI_GetState (const DCMI_HandleTypeDef * hdcmi)

Function description

HAL_DCMI_GetError

Function name

uint32_t HAL_DCMI_GetError (const DCMI_HandleTypeDef * hdcmi)

Function description

17.3 DCMI Firmware driver defines

The following section lists the various define and macros of the module.

17.3.1 DCMI

DCMI

DCMI Byte Select Mode

DCMI_BSM_ALL

Interface captures all received data

DCMI_BSM_OTHER

Interface captures every other byte from the received data

DCMI_BSM_ALTERNATE_4

Interface captures one byte out of four

DCMI_BSM_ALTERNATE_2

Interface captures two bytes out of four

DCMI Byte Select Start

DCMI_OEBS_ODD

Interface captures first data from the frame/line start, second one being dropped

DCMI_OEBS_EVEN

Interface captures second data from the frame/line start, first one being dropped

DCMI Capture Mode

DCMI_MODE_CONTINUOUS

The received data are transferred continuously into the destination memory through the DMA

DCMI_MODE_SNAPSHOT

Once activated, the interface waits for the start of frame and then transfers a single frame through the DMA

DCMI Capture Rate

DCMI_CR_ALL_FRAME

All frames are captured

DCMI_CR_ALTERNATE_2_FRAME

Every alternate frame captured

DCMI_CR_ALTERNATE_4_FRAME

One frame in 4 frames captured

DCMI Error Code

HAL_DCMI_ERROR_NONE

No error

HAL_DCMI_ERROR_OVR

Overrun error

HAL_DCMI_ERROR_SYNC

Synchronization error

HAL_DCMI_ERROR_TIMEOUT

Timeout error

HAL_DCMI_ERROR_DMA

DMA error

HAL_DCMI_ERROR_INVALID_CALLBACK

Invalid callback error

DCMI Exported Macros

__HAL_DCMI_RESET_HANDLE_STATE

Description:

- Reset DCMI handle state.

Parameters:

- __HANDLE__: specifies the DCMI handle.

Return value:

- None

__HAL_DCMI_ENABLE

Description:

- Enable the DCMI.

Parameters:

- __HANDLE__: DCMI handle

Return value:

- None

__HAL_DCMI_DISABLE

Description:

- Disable the DCMI.

Parameters:

- __HANDLE__: DCMI handle

Return value:

- None

__HAL_DCMI_GET_FLAG

Description:

- Get the DCMI pending flag.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: Get the specified flag. This parameter can be one of the following values (no combination allowed)
  - DCMI_FLAG_HSYNC: HSYNC pin state (active line / synchronization between lines)
  - DCMI_FLAG_VSYNC: VSYNC pin state (active frame / synchronization between frames)
  - DCMI_FLAG_FNE: FIFO empty flag
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVRRI: Overrun flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask
  - DCMI_FLAG_FRAMEMI: DCMI Capture complete masked interrupt status
  - DCMI_FLAG_OVRMI: DCMI Overrun masked interrupt status
  - DCMI_FLAG_ERRMI: DCMI Synchronization error masked interrupt status
  - DCMI_FLAG_VSYNCMI: DCMI VSYNC masked interrupt status
  - DCMI_FLAG_LINEMI: DCMI Line masked interrupt status

Return value:

- The: state of FLAG.

__HAL_DCMI_CLEAR_FLAG

Description:

- Clear the DCMI pending flags.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVFRI: Overflow flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask

Return value:

- None

__HAL_DCMI_ENABLE_IT

Description:

- Enable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_DISABLE_IT

Description:

- Disable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_GET_IT_SOURCE

Description:

- Check whether the specified DCMI interrupt has occurred or not.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt source to check. This parameter can be one of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- The: state of INTERRUPT.

DCMI Extended Data Mode

DCMI_EXTEND_DATA_8B

Interface captures 8-bit data on every pixel clock

DCMI_EXTEND_DATA_10B

Interface captures 10-bit data on every pixel clock

DCMI_EXTEND_DATA_12B

Interface captures 12-bit data on every pixel clock

DCMI_EXTEND_DATA_14B

Interface captures 14-bit data on every pixel clock

DCMI Flags

DCMI_FLAG_HSYNC

HSYNC pin state (active line / synchronization between lines)

DCMI_FLAG_VSYNC

VSYNC pin state (active frame / synchronization between frames)

DCMI_FLAG_FNE

FIFO not empty flag

DCMI_FLAG_FRAMERI

Frame capture complete interrupt flag

DCMI_FLAG_OVRRI

Overrun interrupt flag

DCMI_FLAG_ERRRI

Synchronization error interrupt flag

DCMI_FLAG_VSYNCRI

VSYNC interrupt flag

DCMI_FLAG_LINERI

Line interrupt flag

DCMI_FLAG_FRAMEMI

DCMI Frame capture complete masked interrupt status

DCMI_FLAG_OVRMI

DCMI Overrun masked interrupt status

DCMI_FLAG_ERRMI

DCMI Synchronization error masked interrupt status

DCMI_FLAG_VSYNCMI

DCMI VSYNC masked interrupt status

DCMI_FLAG_LINEMI

DCMI Line masked interrupt status

DCMI HSYNC Polarity

DCMI_HSPOLARITY_LOW

Horizontal synchronization active Low

DCMI_HSPOLARITY_HIGH

Horizontal synchronization active High

DCMI interrupt sources

DCMI_IT_FRAME

Capture complete interrupt

DCMI_IT_OVR

Overrun interrupt

DCMI_IT_ERR

Synchronization error interrupt

DCMI_IT_VSYNC

VSYNC interrupt

DCMI_IT_LINE

Line interrupt

DCMI Line Select Mode

DCMI_LSM_ALL

Interface captures all received lines

DCMI_LSM_ALTERNATE_2

Interface captures one line out of two

DCMI Line Select Start

DCMI_OELS_ODD

Interface captures first line from the frame start, second one being dropped

DCMI_OELS_EVEN

Interface captures second line from the frame start, first one being dropped

DCMI Mis Index

DCMI_MIS_INDEX

DCMI MIS register index

DCMI MODE JPEG

DCMI_JPEG_DISABLE

Mode JPEG Disabled

DCMI_JPEG_ENABLE

Mode JPEG Enabled

DCMI PIXCK Polarity

DCMI_PCKPOLARITY_FALLING

Pixel clock active on Falling edge

DCMI_PCKPOLARITY_RISING

Pixel clock active on Rising edge

DCMI SR Index

DCMI_SR_INDEX

DCMI SR register index

DCMI Synchronization Mode

DCMI_SYNCHRO_HARDWARE

Hardware synchronization data capture (frame/line start/stop) is synchronized with the HSYNC/VSYNC signals

DCMI_SYNCHRO_EMBEDDED

Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow

DCMI VSYNC Polarity

DCMI_VSPOLARITY_LOW

Vertical synchronization active Low

DCMI_VSPOLARITY_HIGH

Vertical synchronization active High

DCMI Window Coordinate

DCMI_WINDOW_COORDINATE

Window coordinate

DCMI Window Height

DCMI_WINDOW_HEIGHT

Window Height

18 HAL DMA2D Generic Driver

18.1 DMA2D Firmware driver registers structures

18.1.1 DMA2D_CLUTCfgTypeDef

DMA2D_CLUTCfgTypeDef is defined in the stm32n6xx_hal_dma2d.h

Data Fields

- ***uint32_t * pCLUT***
- ***uint32_t CLUTColorMode***
- ***uint32_t Size***

Field Documentation

- ***uint32_t* DMA2D_CLUTCfgTypeDef::pCLUT***
  Configures the DMA2D CLUT memory address.
- ***uint32_t DMA2D_CLUTCfgTypeDef::CLUTColorMode***
  Configures the DMA2D CLUT color mode. This parameter can be one value of ***DMA2D_CLUT_CM***.
- ***uint32_t DMA2D_CLUTCfgTypeDef::Size***
  Configures the DMA2D CLUT size. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.

18.1.2 DMA2D_InitTypeDef

DMA2D_InitTypeDef is defined in the stm32n6xx_hal_dma2d.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t ColorMode***
- ***uint32_t OutputOffset***
- ***uint32_t AlphaInverted***
- ***uint32_t RedBlueSwap***
- ***uint32_t BytesSwap***
- ***uint32_t LineOffsetMode***

Field Documentation

- ***uint32_t DMA2D_InitTypeDef::Mode***
  Configures the DMA2D transfer mode. This parameter can be one value of ***DMA2D_Mode***.
- ***uint32_t DMA2D_InitTypeDef::ColorMode***
  Configures the color format of the output image. This parameter can be one value of ***DMA2D_Output_Color_Mode***.
- ***uint32_t DMA2D_InitTypeDef::OutputOffset***
  Specifies the Offset value. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFF.
- ***uint32_t DMA2D_InitTypeDef::AlphaInverted***
  Select regular or inverted alpha value for the output pixel format converter. This parameter can be one value of ***DMA2D_Alpha_Inverted***.
- ***uint32_t DMA2D_InitTypeDef::RedBlueSwap***
  Select regular mode (RGB or ARGB) or swap mode (BGR or ABGR) for the output pixel format converter. This parameter can be one value of ***DMA2D_RB_Swap***.
- ***uint32_t DMA2D_InitTypeDef::BytesSwap***
  Select byte regular mode or bytes swap mode (two by two). This parameter can be one value of ***DMA2D_Bytes_Swap***.
- ***uint32_t DMA2D_InitTypeDef::LineOffsetMode***
  Configures how is expressed the line offset for the foreground, background and output. This parameter can be one value of ***DMA2D_Line_Offset_Mode***.

18.1.3 DMA2D_LayerCfgTypeDef

DMA2D_LayerCfgTypeDef is defined in the stm32n6xx_hal_dma2d.h

Data Fields

- ***uint32_t InputOffset***
- ***uint32_t InputColorMode***
- ***uint32_t AlphaMode***
- ***uint32_t InputAlpha***
- ***uint32_t AlphaInverted***
- ***uint32_t RedBlueSwap***
- ***uint32_t ChromaSubSampling***

Field Documentation

- ***uint32_t DMA2D_LayerCfgTypeDef::InputOffset***
  Configures the DMA2D foreground or background offset. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFF.
- ***uint32_t DMA2D_LayerCfgTypeDef::InputColorMode***
  Configures the DMA2D foreground or background color mode. This parameter can be one value of ***DMA2D_Input_Color_Mode***.
- ***uint32_t DMA2D_LayerCfgTypeDef::AlphaMode***
  Configures the DMA2D foreground or background alpha mode. This parameter can be one value of ***DMA2D_Alpha_Mode***.
- ***uint32_t DMA2D_LayerCfgTypeDef::InputAlpha***
  Specifies the DMA2D foreground or background alpha value and color value in case of A8 or A4 color mode. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF except for the color modes detailed below.
  Note:
  – In case of A8 or A4 color mode (ARGB), this parameter must be a number between Min_Data = 0x00000000 and Max_Data = 0xFFFFFFFF where
    ◦ InputAlpha[24:31] is the alpha value ALPHA[0:7]
    ◦ InputAlpha[16:23] is the red value RED[0:7]
    ◦ InputAlpha[8:15] is the green value GREEN[0:7]
    ◦ InputAlpha[0:7] is the blue value BLUE[0:7].
- ***uint32_t DMA2D_LayerCfgTypeDef::AlphaInverted***
  Select regular or inverted alpha value. This parameter can be one value of ***DMA2D_Alpha_Inverted***.
- ***uint32_t DMA2D_LayerCfgTypeDef::RedBlueSwap***
  Select regular mode (RGB or ARGB) or swap mode (BGR or ABGR). This parameter can be one value of ***DMA2D_RB_Swap***.
- ***uint32_t DMA2D_LayerCfgTypeDef::ChromaSubSampling***
  Configure the chroma sub-sampling mode for the YCbCr color mode This parameter can be one value of ***DMA2D_Chroma_Sub_Sampling***

18.1.4 __DMA2D_HandleTypeDef

__DMA2D_HandleTypeDef is defined in the stm32n6xx_hal_dma2d.h

Data Fields

- ***DMA2D_TypeDef * Instance***
- ***DMA2D_InitTypeDef Init***
- ***void(* XferCpltCallback***
- ***void(* XferErrorCallback***
- ***void(* LineEventCallback***
- ***void(* CLUTLoadingCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***DMA2D_LayerCfgTypeDef LayerCfg***
- ***HAL_LockTypeDef Lock***

- ***__IO HAL_DMA2D_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***DMA2D_TypeDef* __DMA2D_HandleTypeDef::Instance***
  DMA2D register base address.
- ***DMA2D_InitTypeDef __DMA2D_HandleTypeDef::Init***
  DMA2D communication parameters.
- ***void(* __DMA2D_HandleTypeDef::XferCpltCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D transfer complete callback.
- ***void(* __DMA2D_HandleTypeDef::XferErrorCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D transfer error callback.
- ***void(* __DMA2D_HandleTypeDef::LineEventCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D line event callback.
- ***void(* __DMA2D_HandleTypeDef::CLUTLoadingCpltCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D CLUT loading completion callback
- ***void(* __DMA2D_HandleTypeDef::MspInitCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D Msp Init callback.
- ***void(* __DMA2D_HandleTypeDef::MspDeInitCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D Msp DeInit callback.
- ***DMA2D_LayerCfgTypeDef __DMA2D_HandleTypeDef::LayerCfg[MAX_DMA2D_LAYER]***
  DMA2D Layers parameters
- ***HAL_LockTypeDef __DMA2D_HandleTypeDef::Lock***
  DMA2D lock.
- ***__IO HAL_DMA2D_StateTypeDef __DMA2D_HandleTypeDef::State***
  DMA2D transfer state.
- ***__IO uint32_t __DMA2D_HandleTypeDef::ErrorCode***
  DMA2D error code.

18.2 DMA2D Firmware driver API description

The following section lists the various functions of the DMA2D library.

18.2.1 How to use this driver

1. Program the required configuration through the following parameters: the transfer mode, the output color mode and the output offset using HAL_DMA2D_Init() function.
2. Program the required configuration through the following parameters: the input color mode, the input color, the input alpha value, the alpha mode, the red/blue swap mode, the inverted alpha mode and the input offset using HAL_DMA2D_ConfigLayer() function for foreground or/and background layer.

Polling mode IO operation

1. Configure pdata parameter (explained hereafter), destination and data length and enable the transfer using HAL_DMA2D_Start().
2. Wait for end of transfer using HAL_DMA2D_PollForTransfer(), at this stage user can specify the value of timeout according to his end application.

Interrupt mode IO operation

1. Configure pdata parameter, destination and data length and enable the transfer using HAL_DMA2D_Start_IT().
2. Use HAL_DMA2D_IRQHandler() called under DMA2D_IRQHandler() interrupt subroutine.
3. At the end of data transfer HAL_DMA2D_IRQHandler() function is executed and user can add his own function by customization of function pointer XferCpltCallback (member of DMA2D handle structure).

4. In case of error, the HAL_DMA2D_IRQHandler() function calls the callback XferErrorCallback.

Note: In Register-to-Memory transfer mode, pdata parameter is the register color, in Memory-to-memory or Memory-to-Memory with pixel format conversion pdata is the source address.

Note: Configure the foreground source address, the background source address, the destination and data length then Enable the transfer using HAL_DMA2D_BlendingStart() in polling mode and HAL_DMA2D_BlendingStart_IT() in interrupt mode.

Note: HAL_DMA2D_BlendingStart() and HAL_DMA2D_BlendingStart_IT() functions are used if the memory to memory with blending transfer mode is selected.

5. Optionally, configure and enable the CLUT using HAL_DMA2D_CLUTLoad() in polling mode or HAL_DMA2D_CLUTLoad_IT() in interrupt mode.
6. Optionally, configure the line watermark in using the API HAL_DMA2D_ProgramLineEvent().
7. Optionally, configure the dead time value in the AHB clock cycle inserted between two consecutive accesses on the AHB master port in using the API HAL_DMA2D_ConfigDeadTime() and enable/disable the functionality with the APIs HAL_DMA2D_EnableDeadTime() or HAL_DMA2D_DisableDeadTime().
8. The transfer can be suspended, resumed and aborted using the following functions: HAL_DMA2D_Suspend(), HAL_DMA2D_Resume(), HAL_DMA2D_Abort().
9. The CLUT loading can be suspended, resumed and aborted using the following functions: HAL_DMA2D_CLUTLoading_Suspend(), HAL_DMA2D_CLUTLoading_Resume(), HAL_DMA2D_CLUTLoading_Abort().
10. To control the DMA2D state, use the following function: HAL_DMA2D_GetState().
11. To read the DMA2D error code, use the following function: HAL_DMA2D_GetError().

DMA2D HAL driver macros list

Below the list of most used macros in DMA2D HAL driver :

- __HAL_DMA2D_ENABLE: Enable the DMA2D peripheral.
- __HAL_DMA2D_GET_FLAG: Get the DMA2D pending flags.
- __HAL_DMA2D_CLEAR_FLAG: Clear the DMA2D pending flags.
- __HAL_DMA2D_ENABLE_IT: Enable the specified DMA2D interrupts.
- __HAL_DMA2D_DISABLE_IT: Disable the specified DMA2D interrupts.
- __HAL_DMA2D_GET_IT_SOURCE: Check whether the specified DMA2D interrupt is enabled or not.

Callback registration

1. The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_DMA2D_RegisterCallback() to register a user callback.
2. Function HAL_DMA2D_RegisterCallback() allows to register following callbacks:
   - XferCpltCallback : callback for transfer complete.
   - XferErrorCallback : callback for transfer error.
   - LineEventCallback : callback for line event.
   - CLUTLoadingCpltCallback : callback for CLUT loading completion.
   - MspInitCallback : DMA2D MspInit.
   - MspDeInitCallback : DMA2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function HAL_DMA2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_DMA2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
   - XferCpltCallback : callback for transfer complete.
   - XferErrorCallback : callback for transfer error.
   - LineEventCallback : callback for line event.
   - CLUTLoadingCpltCallback : callback for CLUT loading completion.
   - MspInitCallback : DMA2D MspInit.
   - MspDeInitCallback : DMA2D MspDeInit.

4. By default, after the HAL_DMA2D_Init and if the state is HAL_DMA2D_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples HAL_DMA2D_LineEventCallback(), HAL_DMA2D_CLUTLoadingCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_DMA2D_Init and HAL_DMA2D_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the HAL_DMA2D_Init and HAL_DMA2D_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Exception as well for Transfer Completion and Transfer Error callbacks that are not defined as weak (surcharged) functions. They must be defined by the user to be resorted to.
5. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_DMA2D_RegisterCallback before calling HAL_DMA2D_DeInit or HAL_DMA2D_Init function.
6. When The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

Note: You can refer to the DMA2D HAL driver header file for more useful macros

18.2.2 Detailed description of functions

HAL_DMA2D_Init

Function name

HAL_StatusTypeDef HAL_DMA2D_Init (DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_DeInit

Function name

HAL_StatusTypeDef HAL_DMA2D_DeInit (DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_MspInit

Function name

void HAL_DMA2D_MspInit (DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_MspDeInit

Function name

void HAL_DMA2D_MspDeInit (DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA2D_RegisterCallback (DMA2D_HandleTypeDef * hdma2d, HAL_DMA2D_CallbackIDTypeDef CallbackID, pDMA2D_CallbackTypeDef pCallback)

Function description

HAL_DMA2D_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA2D_UnRegisterCallback (DMA2D_HandleTypeDef * hdma2d, HAL_DMA2D_CallbackIDTypeDef CallbackID)

Function description

HAL_DMA2D_Start

Function name

HAL_StatusTypeDef HAL_DMA2D_Start (DMA2D_HandleTypeDef * hdma2d, uint32_t pdata, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

HAL_DMA2D_BlendingStart

Function name

HAL_StatusTypeDef HAL_DMA2D_BlendingStart (DMA2D_HandleTypeDef * hdma2d, uint32_t SrcAddress1, uint32_t SrcAddress2, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

HAL_DMA2D_Start_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_Start_IT (DMA2D_HandleTypeDef * hdma2d, uint32_t pdata, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

HAL_DMA2D_BlendingStart_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_BlendingStart_IT (DMA2D_HandleTypeDef * hdma2d, uint32_t SrcAddress1, uint32_t SrcAddress2, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

HAL_DMA2D_Suspend

Function name

HAL_StatusTypeDef HAL_DMA2D_Suspend (DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_Resume

Function name

HAL_StatusTypeDef HAL_DMA2D_Resume (DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_Abort

Function name

HAL_StatusTypeDef HAL_DMA2D_Abort (DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_EnableCLUT

Function name

HAL_StatusTypeDef HAL_DMA2D_EnableCLUT (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

HAL_DMA2D_CLUTStartLoad

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTStartLoad (DMA2D_HandleTypeDef * hdma2d, const DMA2D_CLUTCfgTypeDef * CLUTCfg, uint32_t LayerIdx)

Function description

HAL_DMA2D_CLUTStartLoad_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTStartLoad_IT (DMA2D_HandleTypeDef * hdma2d, const DMA2D_CLUTCfgTypeDef * CLUTCfg, uint32_t LayerIdx)

Function description

HAL_DMA2D_CLUTLoad

Function name

Function description

HAL_DMA2D_GetState

Function name

HAL_DMA2D_StateTypeDef HAL_DMA2D_GetState (const DMA2D_HandleTypeDef * hdma2d)

Function description

HAL_DMA2D_GetError

Function name

uint32_t HAL_DMA2D_GetError (const DMA2D_HandleTypeDef * hdma2d)

Function description

18.3 DMA2D Firmware driver defines

The following section lists the various define and macros of the module.

18.3.1 DMA2D

DMA2D

DMA2D Alpha Inversion

DMA2D_REGULAR_ALPHA

No modification of the alpha channel value

DMA2D_INVERTED_ALPHA

Invert the alpha channel value

DMA2D Alpha Mode

DMA2D_NO_MODIF_ALPHA

No modification of the alpha channel value

DMA2D_REPLACE_ALPHA

Replace original alpha channel value by programmed alpha value

DMA2D_COMBINE_ALPHA

Replace original alpha channel value by programmed alpha value with original alpha channel value

DMA2D Bytes Swap

DMA2D_BYTES_REGULAR

Bytes in regular order in output FIFO

DMA2D_BYTES_SWAP

Bytes are swapped two by two in output FIFO

DMA2D Chroma Sub Sampling

DMA2D_NO_CSS

No chroma sub-sampling 4:4:4

DMA2D_CSS_422

chroma sub-sampling 4:2:2

DMA2D_CSS_420

chroma sub-sampling 4:2:0

DMA2D CLUT Color Mode

DMA2D_CCM_ARGB8888

ARGB8888 DMA2D CLUT color mode

DMA2D_CCM_RGB888

RGB888 DMA2D CLUT color mode

DMA2D CLUT Size

DMA2D_CLUT_SIZE

DMA2D maximum CLUT size

DMA2D Color Value

DMA2D_COLOR_VALUE

Color value mask

DMA2D Error Code

HAL_DMA2D_ERROR_NONE

No error

HAL_DMA2D_ERROR_TE

Transfer error

HAL_DMA2D_ERROR_CE

Configuration error

HAL_DMA2D_ERROR_CAE

CLUT access error

HAL_DMA2D_ERROR_TIMEOUT

Timeout error

HAL_DMA2D_ERROR_INVALID_CALLBACK

Invalid callback error

DMA2D Exported Macros

__HAL_DMA2D_RESET_HANDLE_STATE

Description:

- Reset DMA2D handle state.

Parameters:

- __HANDLE__: specifies the DMA2D handle.

Return value:

- None

__HAL_DMA2D_ENABLE

Description:

- Enable the DMA2D.

Parameters:

- __HANDLE__: DMA2D handle

Return value:

- None.

__HAL_DMA2D_GET_FLAG

Description:

- Get the DMA2D pending flags.

Parameters:

- __HANDLE__: DMA2D handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - DMA2D_FLAG_CE: Configuration error flag
  - DMA2D_FLAG_CTC: CLUT transfer complete flag
  - DMA2D_FLAG_CAE: CLUT access error flag
  - DMA2D_FLAG_TW: Transfer Watermark flag
  - DMA2D_FLAG_TC: Transfer complete flag
  - DMA2D_FLAG_TE: Transfer error flag

Return value:

- The: state of FLAG.

__HAL_DMA2D_CLEAR_FLAG

Description:

- Clear the DMA2D pending flags.

Parameters:

- __HANDLE__: DMA2D handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DMA2D_FLAG_CE: Configuration error flag
  - DMA2D_FLAG_CTC: CLUT transfer complete flag
  - DMA2D_FLAG_CAE: CLUT access error flag
  - DMA2D_FLAG_TW: Transfer Watermark flag
  - DMA2D_FLAG_TC: Transfer complete flag
  - DMA2D_FLAG_TE: Transfer error flag

Return value:

- None

__HAL_DMA2D_ENABLE_IT

Description:

- Enable the specified DMA2D interrupts.

Parameters:

- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DMA2D_IT_CE: Configuration error interrupt mask
  - DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  - DMA2D_IT_CAE: CLUT access error interrupt mask
  - DMA2D_IT_TW: Transfer Watermark interrupt mask
  - DMA2D_IT_TC: Transfer complete interrupt mask
  - DMA2D_IT_TE: Transfer error interrupt mask

Return value:

- None

__HAL_DMA2D_DISABLE_IT

Description:

- Disable the specified DMA2D interrupts.

Parameters:

- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DMA2D_IT_CE: Configuration error interrupt mask
  - DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  - DMA2D_IT_CAE: CLUT access error interrupt mask
  - DMA2D_IT_TW: Transfer Watermark interrupt mask
  - DMA2D_IT_TC: Transfer complete interrupt mask
  - DMA2D_IT_TE: Transfer error interrupt mask

Return value:

- None

__HAL_DMA2D_GET_IT_SOURCE

Description:

- Check whether the specified DMA2D interrupt source is enabled or not.

Parameters:

- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt source to check. This parameter can be one of the following values:
  - DMA2D_IT_CE: Configuration error interrupt mask
  - DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  - DMA2D_IT_CAE: CLUT access error interrupt mask
  - DMA2D_IT_TW: Transfer Watermark interrupt mask
  - DMA2D_IT_TC: Transfer complete interrupt mask
  - DMA2D_IT_TE: Transfer error interrupt mask

Return value:

- The: state of INTERRUPT source.

19 HAL DMA Generic Driver

19.1 DMA Firmware driver registers structures

19.1.1 DMA_InitTypeDef

DMA_InitTypeDef is defined in the stm32n6xx_hal_dma.h

Data Fields

- ***uint32_t Request***
- ***uint32_t BlkHWRequest***
- ***uint32_t Direction***
- ***uint32_t SrcInc***
- ***uint32_t DestInc***
- ***uint32_t SrcDataWidth***
- ***uint32_t DestDataWidth***
- ***uint32_t Priority***
- ***uint32_t SrcBurstLength***
- ***uint32_t DestBurstLength***
- ***uint32_t TransferAllocatedPort***
- ***uint32_t TransferEventMode***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t DMA_InitTypeDef::Request***
  Specifies the DMA channel request. This parameter can be a value of ***DMA_Request_Selection***
- ***uint32_t DMA_InitTypeDef::BlkHWRequest***
  Specifies the Block hardware request mode for DMA channel. Block Hardware request feature can be used only with dedicated peripherals. This parameter can be a value of ***DMA_Block_Request***
- ***uint32_t DMA_InitTypeDef::Direction***
  Specifies the transfer direction for DMA channel. This parameter can be a value of ***DMA_Transfer_Direction***
- ***uint32_t DMA_InitTypeDef::SrcInc***
  Specifies the source increment mode for the DMA channel. This parameter can be a value of ***DMA_Source_Increment_Mode***
- ***uint32_t DMA_InitTypeDef::DestInc***
  Specifies the destination increment mode for the DMA channel. This parameter can be a value of ***DMA_Destination_Increment_Mode***
- ***uint32_t DMA_InitTypeDef::SrcDataWidth***
  Specifies the source data width for the DMA channel. This parameter can be a value of ***DMA_Source_Data_Width***
- ***uint32_t DMA_InitTypeDef::DestDataWidth***
  Specifies the destination data width for the DMA channel. This parameter can be a value of ***DMA_Destination_Data_Width***
- ***uint32_t DMA_InitTypeDef::Priority***
  Specifies the priority level for the DMA channel. This parameter can be a value of ***DMA_Priority_Level***
- ***uint32_t DMA_InitTypeDef::SrcBurstLength***
  Specifies the source burst length (number of beats within a burst) for the DMA channel. This parameter can be a value between 1 and 64
- ***uint32_t DMA_InitTypeDef::DestBurstLength***
  Specifies the destination burst length (number of beats within a burst) for the DMA channel. This parameter can be a value between 1 and 64
- ***uint32_t DMA_InitTypeDef::TransferAllocatedPort***
  Specifies the transfer allocated ports. This parameter can be a combination of ***DMA_Transfer_Allocated_Port***

- ***uint32_t DMA_InitTypeDef::TransferEventMode***
  Specifies the transfer event mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Event_Mode***
- ***uint32_t DMA_InitTypeDef::Mode***
  Specifies the transfer mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Mode***

19.1.2 DMA_InitLinkedListTypeDef

DMA_InitLinkedListTypeDef is defined in the stm32n6xx_hal_dma.h

Data Fields

- ***uint32_t Priority***
- ***uint32_t LinkStepMode***
- ***uint32_t LinkAllocatedPort***
- ***uint32_t TransferEventMode***
- ***uint32_t LinkedListMode***

Field Documentation

- ***uint32_t DMA_InitLinkedListTypeDef::Priority***
  Specifies the priority level for the DMA channel. This parameter can be a value of ***DMA_Priority_Level***
- ***uint32_t DMA_InitLinkedListTypeDef::LinkStepMode***
  Specifies the link step mode for the DMA channel. This parameter can be a value of ***DMAEx_Link_Step_Mode***
- ***uint32_t DMA_InitLinkedListTypeDef::LinkAllocatedPort***
  Specifies the linked-list allocated port for the DMA channel. This parameter can be a value of ***DMAEx_Link_Allocated_Port***
- ***uint32_t DMA_InitLinkedListTypeDef::TransferEventMode***
  Specifies the transfer event mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Event_Mode***
- ***uint32_t DMA_InitLinkedListTypeDef::LinkedListMode***
  Specifies linked-list transfer mode for the DMA channel. This parameter can be a value of ***DMAEx_LinkedList_Mode***

19.1.3 DMA_IsolationConfigTypeDef

DMA_IsolationConfigTypeDef is defined in the stm32n6xx_hal_dma.h

Data Fields

- ***uint32_t CidFiltering***
- ***uint32_t StaticCid***

Field Documentation

- ***uint32_t DMA_IsolationConfigTypeDef::CidFiltering***
  Specified the CID filtering mode. This parameter can be a value of ***DMA_ISOLATION_MODE***
- ***uint32_t DMA_IsolationConfigTypeDef::StaticCid***
  Specified the static CID. This parameter can be a value of ***DMA_Channel_CID_Filtering_Static***

19.1.4 __DMA_HandleTypeDef

__DMA_HandleTypeDef is defined in the stm32n6xx_hal_dma.h

Data Fields

- ***DMA_Channel_TypeDef * Instance***
- ***DMA_InitTypeDef Init***
- ***DMA_InitLinkedListTypeDef InitLinkedList***
- ***HAL_LockTypeDef Lock***
- ***uint32_t Mode***
- ***__IO HAL_DMA_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void * Parent***
- ***void(* XferCpltCallback***

- ***void(* XferHalfCpltCallback***
- ***void(* XferErrorCallback***
- ***void(* XferAbortCallback***
- ***void(* XferSuspendCallback***
- ***struct __DMA_QListTypeDef * LinkedListQueue***

Field Documentation

- ***DMA_Channel_TypeDef* __DMA_HandleTypeDef::Instance***
  Register the DMA channel base address
- ***DMA_InitTypeDef __DMA_HandleTypeDef::Init***
  DMA channel init parameters
- ***DMA_InitLinkedListTypeDef __DMA_HandleTypeDef::InitLinkedList***
  DMA channel linked-list init parameters
- ***HAL_LockTypeDef __DMA_HandleTypeDef::Lock***
  DMA locking object
- ***uint32_t __DMA_HandleTypeDef::Mode***
  DMA transfer mode
- ***__IO HAL_DMA_StateTypeDef __DMA_HandleTypeDef::State***
  DMA transfer state
- ***__IO uint32_t __DMA_HandleTypeDef::ErrorCode***
  DMA error code
- ***void* __DMA_HandleTypeDef::Parent***
  Parent object state
- ***void(* __DMA_HandleTypeDef::XferCpltCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer complete callback
- ***void(* __DMA_HandleTypeDef::XferHalfCpltCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA half transfer complete callback
- ***void(* __DMA_HandleTypeDef::XferErrorCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer error callback
- ***void(* __DMA_HandleTypeDef::XferAbortCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer Abort callback
- ***void(* __DMA_HandleTypeDef::XferSuspendCallback)(struct __DMA_HandleTypeDef *hdma)***
  DMA transfer Suspend callback
- ***struct __DMA_QListTypeDef* __DMA_HandleTypeDef::LinkedListQueue***
  DMA linked-list queue

19.2 DMA Firmware driver API description

The following section lists the various functions of the DMA library.

19.2.1 How to use this driver

1. GPDMA and HPDMA are made available on this series. Transfer could be done thanks to AXI or AHB ports. HPDMA support transmission through: AXI port 0. AHB port 1. GPDMA allows transmission through: GPDMA_P = port-0. GPDMA_M = port-1 The supported configurations for GPDMA and HPDMA can be found in the Connectivity matrix table of the reference manual. Mind that DTCM and ITCM can be only be accessed thanks to HPDMA AXI port 0.

DMA transfer modes are divided to 2 major categories :

- Normal transfers (legacy)
- Linked-list transfers

Normal transfers mode is initialized via the standard module and linked-list mode is configured via the extended module.

Additionally to linked-list capability, all advanced DMA features are managed and configured via the extended module as extensions to normal mode. Advanced features are :

- Repeated block feature.
- Trigger feature.

- Data handling feature.

DMA Legacy circular transfer, is replaced by circular linked-list configuration.

Initialization and De-Initialization

For a given channel, enable and configure the peripheral to be connected to the DMA Channel (except for internal SRAM/FLASH memories: no initialization is necessary) please refer to Reference manual for connection between peripherals and DMA requests.

For a given channel, use HAL_DMA_Init function to program the required configuration for normal transfer through the following parameters:

- Request : Specifies the DMA channel request Request parameters :
  - can be a value of DMA_Request_Selection
- BlkHWRequest : Specifies the Block hardware request mode for DMA channel
  - can be a value of DMA_Block_Request
- Direction : Specifies the transfer direction for DMA channel
  - can be a value of DMA_Transfer_Direction
- SrcInc : Specifies the source increment mode for the DMA channel
  - can be a value of DMA_Source_Increment_Mode
- DestInc : Specifies the destination increment mode for the DMA channel
  - can be a value of DMA_Destination_Increment_Mode
- SrcDataWidth : Specifies the source data width for the DMA channel
  - can be a value of DMA_Source_Data_Width
- DestDataWidth : Specifies the destination data width for the DMA channel
  - can be a value of DMA_Destination_Data_Width
- Priority : Specifies the priority for the DMA channel
  - can be a value of DMA_Priority_Level
- SrcBurstLength : Specifies the source burst length (number of beats) for the DMA channel
  - can be a value of between 1 and 64
- DestBurstLength : Specifies the destination burst length (number of beats) for the DMA channel
  - can be a value of between 1 and 64
- TransferAllocatedPort : Specifies the source and destination allocated ports
  - can be a value of DMA_Transfer_Allocated_Port
- TransferEventMode : Specifies the transfer event mode for the DMA channel
  - can be a value of DMA_Transfer_Event_Mode
- Mode : Specifies the transfer mode for the DMA channel
  - can be one of the following modes :
    - DMA_NORMAL : Normal Mode
    - DMA_PFCTRL : Peripheral Flow Control (peripheral early termination) Mode

Polling mode IO operation

- Use HAL_DMA_Start() to start a DMA normal transfer after the configuration of source address, destination address and the size of data to be transferred.
- Use HAL_DMA_PollForTransfer() to poll for selected transfer level. In this case a fixed Timeout can be configured by User depending on his application. Transfer level can be :
  - HAL_DMA_HALF_TRANSFER
  - HAL_DMA_FULL_TRANSFER For circular transfer, this API returns an HAL_ERROR with HAL_DMA_ERROR_NOT_SUPPORTED error code.
- Use HAL_DMA_Abort() function to abort any ongoing DMA transfer in blocking mode. This API returns HAL_ERROR when there is no ongoing transfer or timeout is reached when disabling the DMA channel. (This API should not be called from an interrupt service routine)

Interrupt mode IO operation

- Configure the DMA interrupt priority using HAL_NVIC_SetPriority()
- Enable the DMA IRQ handler using HAL_NVIC_EnableIRQ()
- Use HAL_DMA_RegisterCallback() function to register user callbacks from the following list :
  - XferCpltCallback : transfer complete callback.
  - XferHalfCpltCallback : half transfer complete callback.
  - XferErrorCallback : transfer error callback.
  - XferAbortCallback : transfer abort complete callback.
  - XferSuspendCallback : transfer suspend complete callback.
- Use HAL_DMA_Start_IT() to start the DMA transfer after the enable of DMA interrupts and the configuration of source address,destination address and the size of data to be transferred.
- Use HAL_DMA_IRQHandler() called under DMA_IRQHandler() interrupt subroutine to handle any DMA interrupt.
- Use HAL_DMA_Abort_IT() function to abort any on-going DMA transfer in non-blocking mode. This API will suspend immediately the DMA channel execution. When the transfer is effectively suspended, an interrupt is generated and HAL_DMA_IRQHandler() will reset the channel and execute the callback XferAbortCallback. (This API could be called from an interrupt service routine)

State and errors

- Use HAL_DMA_GetState() function to get the DMA state.
- Use HAL_DMA_GetError() function to get the DMA error code.

Security and privilege attributes

- Use HAL_DMA_ConfigChannelAttributes() function to configure DMA channel security and privilege attributes.
  - Security : at channel level, at source level and at destination level.
  - Privilege : at channel level.
- Use HAL_DMA_GetConfigChannelAttributes() function to get the DMA channel attributes.
- Use HAL_DMA_LockChannelAttributes() function to lock the DMA channel security and privilege attributes configuration. This API can be called once after each system boot. If called again, HAL_DMA_ConfigChannelAttributes() API has no effect. Unlock is done either by a system boot or a by an RCC reset.
- Use HAL_DMA_GetLockChannelAttributes() function to get the attributes lock status.
- Use HAL_DMA_SetIsolationAttributes() function to configure the HPDMA channel isolation attribute.
- Use HAL_DMA_GetIsolationAttributes() function to get the HPDMA channel isolation attribute.

Isolation attributes

DMA HAL driver macros list

Below the list of most used macros in DMA HAL driver.

- __HAL_DMA_ENABLE : Enable the specified DMA Channel.
- __HAL_DMA_DISABLE : Disable the specified DMA Channel.
- __HAL_DMA_GET_FLAG : Get the DMA Channel pending flags.
- __HAL_DMA_CLEAR_FLAG : Clear the DMA Channel pending flags.
- __HAL_DMA_ENABLE_IT : Enable the specified DMA Channel interrupts.
- __HAL_DMA_DISABLE_IT : Disable the specified DMA Channel interrupts.
- __HAL_DMA_GET_IT_SOURCE : Check whether the specified DMA Channel interrupt has occurred or not.

Valid burst length

HPDMA allowed AXI maximum burst length

- The maximum allowed AXI burst length shall not exceed 16.
  - If either selected source or destination length is above 16, HAL_DMA_Init will return HAL_ERROR.

Note: You can refer to the header file of the DMA HAL driver for more useful macros.

19.2.2 Initialization and de-initialization functions

This section provides functions allowing to initialize and de-initialize the DMA channel in normal mode.

- The HAL_DMA_Init() function follows the DMA channel configuration procedures as described in reference manual.
- The HAL_DMA_DeInit() function allows to de-initialize the DMA channel.

This section contains the following APIs:

- ***HAL_DMA_Init()***
- ***HAL_DMA_DeInit()***

19.2.3 IO operation functions

This section provides functions allowing to :

- Configure the source, destination address and data size and Start DMA transfer in normal mode
- Abort DMA transfer
- Poll for transfer complete
- Handle DMA interrupt request
- Register and Unregister DMA callbacks
- The HAL_DMA_Start() function allows to start the DMA channel transfer in normal mode (Blocking mode).
- The HAL_DMA_Start_IT() function allows to start the DMA channel transfer in normal mode (Non-blocking mode).
- The HAL_DMA_Abort() function allows to abort any on-going transfer (Blocking mode).
- The HAL_DMA_Abort_IT() function allows to abort any on-going transfer (Non-blocking mode).
- The HAL_DMA_PollForTransfer() function allows to poll on half transfer and transfer complete (Blocking mode). This API cannot be used for circular transfers.
- The HAL_DMA_IRQHandler() function allows to handle any DMA channel interrupt (Non-blocking mode).
- The HAL_DMA_RegisterCallback() and HAL_DMA_UnRegisterCallback() functions allow respectively to register and unregister user customized callbacks. User callbacks are called under HAL_DMA_IRQHandler().

This section contains the following APIs:

- ***HAL_DMA_Start()***
- ***HAL_DMA_Start_IT()***
- ***HAL_DMA_Abort()***
- ***HAL_DMA_Abort_IT()***
- ***HAL_DMA_PollForTransfer()***
- ***HAL_DMA_IRQHandler()***
- ***HAL_DMA_RegisterCallback()***
- ***HAL_DMA_UnRegisterCallback()***

19.2.4 State and Errors functions

This section provides functions allowing to :

- Check the DMA state
- Get error code
- The HAL_DMA_GetState() function allows to get the DMA channel state.
- The HAL_DMA_DeInit() function allows to get the DMA channel error code.

This section contains the following APIs:

- ***HAL_DMA_GetState()***
- ***HAL_DMA_GetError()***

19.2.5 DMA Attributes functions

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- ***HAL_DMA_ConfigChannelAttributes()***
- ***HAL_DMA_GetConfigChannelAttributes()***
- ***HAL_DMA_SetIsolationAttributes()***
- ***HAL_DMA_GetIsolationAttributes()***
- ***HAL_DMA_LockChannelAttributes()***
- ***HAL_DMA_GetLockChannelAttributes()***

19.2.6 Detailed description of functions

HAL_DMA_Init

Function name

HAL_StatusTypeDef HAL_DMA_Init (DMA_HandleTypeDef *const hdma)

Function description

Initialize the DMA channel in normal mode according to the specified parameters in the DMA_InitTypeDef and create the associated handle.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

Notes

- Warning: the maximum allowed AXI burst length shall not exceed 16. Otherwise, an error will be returned and no initialization performed.

HAL_DMA_DeInit

Function name

HAL_StatusTypeDef HAL_DMA_DeInit (DMA_HandleTypeDef *const hdma)

Function description

DeInitialize the DMA channel when it is configured in normal mode.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_Start

Function name

HAL_StatusTypeDef HAL_DMA_Start (DMA_HandleTypeDef *const hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SrcDataSize)

Function description

Start the DMA channel transfer in normal mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **SrcAddress:** : The source data address.
- **DstAddress:** : The destination data address.
- **SrcDataSize:** : The length of data to be transferred from source to destination in bytes.

Return values

- **HAL:** status.

HAL_DMA_Start_IT

Function name

HAL_StatusTypeDef HAL_DMA_Start_IT (DMA_HandleTypeDef *const hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SrcDataSize)

Function description

Starts the DMA channel transfer in normal mode with interrupts enabled (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **SrcAddress:** : The source data address.
- **DstAddress:** : The destination data address.
- **SrcDataSize:** : The length of data to be transferred from source to destination in bytes.

Return values

- **HAL:** status.

HAL_DMA_Abort

Function name

HAL_StatusTypeDef HAL_DMA_Abort (DMA_HandleTypeDef *const hdma)

Function description

Abort any on-going DMA channel transfer (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

Notes

- After suspending a DMA channel, a wait until the DMA channel is effectively stopped is added. If a channel is suspended while a data transfer is on-going, the current data will be transferred and the channel will be effectively suspended only after the transfer of any on-going data is finished.

HAL_DMA_Abort_IT

Function name

HAL_StatusTypeDef HAL_DMA_Abort_IT (DMA_HandleTypeDef *const hdma)

Function description

Abort any on-going DMA channel transfer in interrupt mode (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_PollForTransfer

Function name

HAL_StatusTypeDef HAL_DMA_PollForTransfer (DMA_HandleTypeDef *const hdma, HAL_DMA_LevelCompleteTypeDef CompleteLevel, uint32_t Timeout)

Function description

Polling for transfer status (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CompleteLevel:** : Specifies the DMA level complete.
- **Timeout:** : Timeout duration.

Return values

- **HAL:** status

HAL_DMA_IRQHandler

Function name

void HAL_DMA_IRQHandler (DMA_HandleTypeDef *const hdma)

Function description

Handle DMA interrupt request (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **None.:**

HAL_DMA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_RegisterCallback (DMA_HandleTypeDef *const hdma, HAL_DMA_CallbackIDTypeDef CallbackID, void(*)(DMA_HandleTypeDef *const _hdma) pCallback)

Function description

Register callback according to specified ID.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CallbackID:** : User Callback identifier which could be a value of HAL_DMA_CallbackIDTypeDef enumeration.
- **pCallback:** : Pointer to private callback function.

Return values

- **HAL:** status.

Notes

- The HAL_DMA_RegisterCallback() may be called before HAL_DMA_Init() in HAL_DMA_STATE_RESET to register callbacks for HAL_DMA_MSPINIT_CB_ID and HAL_DMA_MSPDEINIT_CB_ID.

HAL_DMA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_UnRegisterCallback (DMA_HandleTypeDef *const hdma, HAL_DMA_CallbackIDTypeDef CallbackID)

Function description

Unregister callback according to specified ID.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CallbackID:** : User Callback identifier which could be a value of HAL_DMA_CallbackIDTypeDef enum.

Return values

- **HAL:** status.

Notes

- The HAL_DMA_UnRegisterCallback() may be called before HAL_DMA_Init() in HAL_DMA_STATE_RESET to un-register callbacks for HAL_DMA_MSPINIT_CB_ID and HAL_DMA_MSPDEINIT_CB_ID.

HAL_DMA_GetState

Function name

HAL_DMA_StateTypeDef HAL_DMA_GetState (DMA_HandleTypeDef const *const hdma)

Function description

Returns the DMA channel state.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **DMA:** state.

HAL_DMA_GetError

Function name

uint32_t HAL_DMA_GetError (DMA_HandleTypeDef const *const hdma)

Function description

Return the DMA channel error code.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **DMA:** Error Code.

HAL_DMA_ConfigChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_ConfigChannelAttributes (DMA_HandleTypeDef *const hdma, uint32_t ChannelAttributes)

Function description

Configure the DMA channel security and privilege attribute(s).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **ChannelAttributes:** : Specifies the DMA channel secure/privilege attributes. This parameter can be a one or a combination of DMA Channel Attributes.

Return values

- **HAL:** Status.

Notes

- These attributes cannot be modified when the corresponding lock state is enabled.

HAL_DMA_GetConfigChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_GetConfigChannelAttributes (DMA_HandleTypeDef const *const hdma, uint32_t *const pChannelAttributes)

Function description

Get the DMA channel security and privilege attributes.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pChannelAttributes:** : Pointer to the returned attributes.

Return values

- **HAL:** Status.

HAL_DMA_LockChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_LockChannelAttributes (DMA_HandleTypeDef const *const hdma)

Function description

Lock the DMA channel security and privilege attribute(s).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** Status.

HAL_DMA_GetLockChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_GetLockChannelAttributes (DMA_HandleTypeDef const *const hdma, uint32_t *const pLockState)

Function description

Get the security and privilege attribute lock state of a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pLockState:** : Pointer to lock state (returned value can be DMA_CHANNEL_ATTRIBUTE_UNLOCKED or DMA_CHANNEL_ATTRIBUTE_LOCKED).

Return values

- **HAL:** status.

HAL_DMA_SetIsolationAttributes

Function name

HAL_StatusTypeDef HAL_DMA_SetIsolationAttributes (DMA_HandleTypeDef *const hdma, DMA_IsolationConfigTypeDef const *const pConfig)

Function description

Set the DMA channel filtering CID (Isolation configuration).

HAL_DMA_GetIsolationAttributes

Function name

HAL_StatusTypeDef HAL_DMA_GetIsolationAttributes (DMA_HandleTypeDef const *const hdma, DMA_IsolationConfigTypeDef *const pConfig)

Function description

Read the DMA channel filtering CID (Isolation configuration).

19.3 DMA Firmware driver defines

The following section lists the various define and macros of the module.

19.3.1 DMA

DMA

DMA Block Request

DMA_BREQ_SINGLE_BURST

Hardware request protocol at a single / burst level

DMA_BREQ_BLOCK

Hardware request protocol at a block level

DMA Channel Attributes

DMA_CHANNEL_PRIV

Channel is privileged

DMA_CHANNEL_NPRIV

Channel is unprivileged

DMA_CHANNEL_SEC

Channel is secure

DMA_CHANNEL_NSEC

Channel is non-secure

DMA_CHANNEL_SRC_SEC

Channel source is secure

DMA_CHANNEL_SRC_NSEC

Channel source is non-secure

DMA_CHANNEL_DEST_SEC

Channel destination is secure

DMA_CHANNEL_DEST_NSEC

Channel destination is non-secure

DMA_CHANNEL_ATTRIBUTE_UNLOCKED

Channel attribute is unlocked

DMA_CHANNEL_ATTRIBUTE_LOCKED

Channel attribute is locked

Static DMA Channel Filtering CID (isolation)

DMA_CHANNEL_STATIC_CID_0

Channel control to CID0 in static mode

DMA_CHANNEL_STATIC_CID_1

Channel control to CID1 in static mode

DMA_CHANNEL_STATIC_CID_2

Channel control to CID2 in static mode

DMA_CHANNEL_STATIC_CID_3

Channel control to CID3 in static mode

DMA_CHANNEL_STATIC_CID_4

Channel control to CID4 in static mode

DMA_CHANNEL_STATIC_CID_5

Channel control to CID5 in static mode

DMA_CHANNEL_STATIC_CID_6

Channel control to CID6 in static mode

DMA destination Data Width

DMA_DEST_DATAWIDTH_BYTE

Destination data width : Byte

DMA_DEST_DATAWIDTH_HALFWORD

Destination data width : HalfWord

DMA_DEST_DATAWIDTH_WORD

Destination data width : Word

DMA_DEST_DATAWIDTH_DOUBLEWORD

Destination data width : DoubleWord

DMA Destination Increment Mode

DMA_DINC_FIXED

Destination fixed single / burst

DMA_DINC_INCREMENTED

Destination incremented single / burst

DMA Error Codes

HAL_DMA_ERROR_NONE

No error

HAL_DMA_ERROR_DTE

Data transfer error

HAL_DMA_ERROR_ULE

Update linked-list item error

HAL_DMA_ERROR_USE

User setting error

HAL_DMA_ERROR_TO

Trigger overrun error

HAL_DMA_ERROR_TIMEOUT

Timeout error

HAL_DMA_ERROR_NO_XFER

No transfer ongoing error

HAL_DMA_ERROR_BUSY

Busy error

HAL_DMA_ERROR_INVALID_CALLBACK

Invalid callback error

HAL_DMA_ERROR_NOT_SUPPORTED

Not supported mode

DMA Exported Macros

__HAL_DMA_RESET_HANDLE_STATE

Description:

- Reset DMA handle state.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None.

__HAL_DMA_ENABLE

Description:

- Enable the specified DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None

__HAL_DMA_DISABLE

Description:

- Disable the specified DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None

__HAL_DMA_GET_FLAG

Description:

- Get the DMA channel pending flags.

Parameters:

- __HANDLE__: : DMA handle.
- __FLAG__: : Get the specified flag. This parameter can be any combination of the following values:
  - DMA_FLAG_TC : Transfer Complete flag.
  - DMA_FLAG_HT : Half Transfer Complete flag.
  - DMA_FLAG_DTE : Data Transfer Error flag.
  - DMA_FLAG_ULE : Update linked-list Error flag.
  - DMA_FLAG_USE : User Setting Error flag.
  - DMA_FLAG_TO : Trigger Overrun flag.
  - DMA_FLAG_SUSP : Completed Suspension flag.
  - DMA_FLAG_IDLEF : Idle flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_DMA_CLEAR_FLAG

Description:

- Clear the DMA Channel pending flags.

Parameters:

- __HANDLE__: : DMA handle.
- __FLAG__: : Specifies the flag to clear. This parameter can be any combination of the following values:
  - DMA_FLAG_TC : Transfer Complete flag.
  - DMA_FLAG_HT : Half Transfer Complete flag.
  - DMA_FLAG_DTE : Data Transfer Error flag.
  - DMA_FLAG_ULE : Update Linked-List Error flag.
  - DMA_FLAG_USE : User Setting Error flag.
  - DMA_FLAG_TO : Trigger Overrun flag.
  - DMA_FLAG_SUSP : Completed Suspension flag.

Return value:

- None

__HAL_DMA_ENABLE_IT

Description:

- Enable the specified DMA Channel interrupts.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : Specifies the DMA interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- None

__HAL_DMA_DISABLE_IT

Description:

- Disable the specified DMA Channel interrupts.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : specifies the DMA interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- None

__HAL_DMA_GET_IT_SOURCE

Description:

- Checks whether the specified DMA Channel interrupt is enabled or not.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : specifies the DMA interrupt source to check.
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- The: state of DMA_IT (SET or RESET).

__HAL_DMA_SET_COUNTER

Description:

- Writes the block number of bytes to be transferred from the source on the DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.
- __COUNTER__: : Number of data bytes to be transferred from the source (from 0 to 65535).

__HAL_DMA_GET_COUNTER

Description:

- Returns the number of remaining data bytes in the current DMA Channel transfer.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- The: number of remaining data units in the current DMA Stream transfer.

DMA Flag Definition

DMA_FLAG_IDLE

Idle flag

DMA_FLAG_TC

Transfer complete flag

DMA_FLAG_HT

Half transfer complete flag

DMA_FLAG_DTE

Data transfer error flag

DMA_FLAG_ULE

Update linked-list item error flag

DMA_FLAG_USE

User setting error flag

DMA_FLAG_SUSP

Completed suspension flag

DMA_FLAG_TO

Trigger overrun flag

TIM DMA Handle Index

TIM_DMA_ID_UPDATE

Index of the DMA handle used for Update DMA requests

TIM_DMA_ID_CC1

Index of the DMA handle used for Capture/Compare 1 DMA requests

TIM_DMA_ID_CC2

Index of the DMA handle used for Capture/Compare 2 DMA requests

TIM_DMA_ID_CC3

Index of the DMA handle used for Capture/Compare 3 DMA requests

TIM_DMA_ID_CC4

Index of the DMA handle used for Capture/Compare 4 DMA requests

TIM_DMA_ID_COMMUTATION

Index of the DMA handle used for Commutation DMA requests

TIM_DMA_ID_TRIGGER

Index of the DMA handle used for Trigger DMA requests

DMA Interrupt Enable Definition

DMA_IT_TC

Transfer complete interrupt

DMA_IT_HT

Half transfer complete interrupt

DMA_IT_DTE

Data transfer error interrupt

DMA_IT_ULE

Update linked-list item error interrupt

DMA_IT_USE

User eetting error interrupt

DMA_IT_SUSP

Completed suspension interrupt

DMA_IT_TO

Trigger overrun interrupt

DMA Channel isolation mode (CID filtering)

DMA_ISOLATION_OFF

DMA Channel isolation (CID filtering) is disabled

DMA_ISOLATION_ON

DMA Channel isolation (CID filtering) is enabled

DMA Priority Level

DMA_LOW_PRIORITY_LOW_WEIGHT

Priority level : Low Priority, Low weight

DMA_LOW_PRIORITY_MID_WEIGHT

Priority level : Low Priority, Mid weight

DMA_LOW_PRIORITY_HIGH_WEIGHT

Priority level : Low Priority, High weight

DMA_HIGH_PRIORITY

Priority level : HIGH Priority

20 HAL DMA Extension Driver

20.1 DMAEx Firmware driver registers structures

20.1.1 DMA_DataHandlingConfTypeDef

DMA_DataHandlingConfTypeDef is defined in the stm32n6xx_hal_dma_ex.h

Data Fields

- ***uint32_t DataExchange***
- ***uint32_t DataAlignment***

Field Documentation

- ***uint32_t DMA_DataHandlingConfTypeDef::DataExchange***
  Specifies the DMA channel data exchange mode. This parameter can be a value of ***DMAEx_Data_Exchange***
- ***uint32_t DMA_DataHandlingConfTypeDef::DataAlignment***
  Specifies the DMA channel data padding and alignment mode This parameter can be a value of ***DMAEx_Data_Alignment***

20.1.2 DMA_TriggerConfTypeDef

DMA_TriggerConfTypeDef is defined in the stm32n6xx_hal_dma_ex.h

Data Fields

- ***uint32_t TriggerMode***
- ***uint32_t TriggerPolarity***
- ***uint32_t TriggerSelection***

Field Documentation

- ***uint32_t DMA_TriggerConfTypeDef::TriggerMode***
  Specifies the DMA channel trigger mode. This parameter can be a value of ***DMAEx_Trigger_Mode***
- ***uint32_t DMA_TriggerConfTypeDef::TriggerPolarity***
  Specifies the DMA channel trigger event polarity. This parameter can be a value of ***DMAEx_Trigger_Polarity***
- ***uint32_t DMA_TriggerConfTypeDef::TriggerSelection***
  Specifies the DMA channel trigger event selection. This parameter can be a value of ***DMAEx_Trigger_Selection***

20.1.3 DMA_RepeatBlockConfTypeDef

DMA_RepeatBlockConfTypeDef is defined in the stm32n6xx_hal_dma_ex.h

Data Fields

- ***uint32_t RepeatCount***
- ***int32_t SrcAddrOffset***
- ***int32_t DestAddrOffset***
- ***int32_t BlkSrcAddrOffset***
- ***int32_t BlkDestAddrOffset***

Field Documentation

- ***uint32_t DMA_RepeatBlockConfTypeDef::RepeatCount***
  Specifies the DMA channel repeat count (the number of repetitions of block). This parameter can be a value between 1 and 2048
- ***int32_t DMA_RepeatBlockConfTypeDef::SrcAddrOffset***
  Specifies the DMA channel single/burst source address offset : This parameter can be a value between -8191 and 8191. If source address offset > 0 => Increment the source address by offset from where the last single/burst transfer ends. If source address offset < 0 => Decrement the source address by offset from where the last single/burst transfer ends. If source address offset == 0 => The next single/burst source address starts from where the last transfer ends

- ***int32_t DMA_RepeatBlockConfTypeDef::DestAddrOffset***
  Specifies the DMA channel single/burst destination address offset signed value : This parameter can be a value between -8191 and 8191. If destination address offset > 0 => Increment the destination address by offset from where the last single/burst transfer ends. If destination address offset < 0 => Decrement the destination address by offset from where the last single/burst transfer ends. If destination address offset == 0 => The next single/burst destination address starts from where the last transfer ends.
- ***int32_t DMA_RepeatBlockConfTypeDef::BlkSrcAddrOffset***
  Specifies the DMA channel block source address offset signed value : This parameter can be a value between -65535 and 65535. If block source address offset > 0 => Increment the block source address by offset from where the last block ends. If block source address offset < 0 => Decrement the next block source address by offset from where the last block ends. If block source address offset == 0 => the next block source address starts from where the last block ends
- ***int32_t DMA_RepeatBlockConfTypeDef::BlkDestAddrOffset***
  Specifies the DMA channel block destination address offset signed value : This parameter can be a value between -65535 and 65535. If block destination address offset > 0 => Increment the block destination address by offset from where the last block ends. If block destination address offset < 0 => Decrement the next block destination address by offset from where the last block ends. If block destination address offset == 0 => the next block destination address starts from where the last block ends

20.1.4 DMA_NodeConfTypeDef

DMA_NodeConfTypeDef is defined in the stm32n6xx_hal_dma_ex.h

Data Fields

- ***uint32_t NodeType***
- ***DMA_InitTypeDef Init***
- ***DMA_DataHandlingConfTypeDef DataHandlingConfig***
- ***DMA_TriggerConfTypeDef TriggerConfig***
- ***DMA_RepeatBlockConfTypeDef RepeatBlockConfig***
- ***uint32_t SrcAddress***
- ***uint32_t DstAddress***
- ***uint32_t DataSize***
- ***uint32_t SrcSecure***
- ***uint32_t DestSecure***

Field Documentation

- ***uint32_t DMA_NodeConfTypeDef::NodeType***
  Specifies the DMA channel node type. This parameter can be a value of ***DMAEx_Node_Type***
- ***DMA_InitTypeDef DMA_NodeConfTypeDef::Init***
  Specifies the DMA channel basic configuration
- ***DMA_DataHandlingConfTypeDef DMA_NodeConfTypeDef::DataHandlingConfig***
  Specifies the DMA channel data handling channel configuration
- ***DMA_TriggerConfTypeDef DMA_NodeConfTypeDef::TriggerConfig***
  Specifies the DMA channel trigger configuration
- ***DMA_RepeatBlockConfTypeDef DMA_NodeConfTypeDef::RepeatBlockConfig***
  Specifies the DMA channel repeated block configuration
- ***uint32_t DMA_NodeConfTypeDef::SrcAddress***
  Specifies the source memory address
- ***uint32_t DMA_NodeConfTypeDef::DstAddress***
  Specifies the destination memory address
- ***uint32_t DMA_NodeConfTypeDef::DataSize***
  Specifies the source data size in bytes
- ***uint32_t DMA_NodeConfTypeDef::SrcSecure***
  Specifies the source security attribute
- ***uint32_t DMA_NodeConfTypeDef::DestSecure***
  Specifies the destination security attribute

20.1.5 DMA_NodeTypeDef

DMA_NodeTypeDef is defined in the stm32n6xx_hal_dma_ex.h

Data Fields

- ***uint32_t LinkRegisters***
- ***uint32_t NodeInfo***

Field Documentation

- ***uint32_t DMA_NodeTypeDef::LinkRegisters[8U]***
  Physical Node register description
- ***uint32_t DMA_NodeTypeDef::NodeInfo***
  Node information

20.1.6 __DMA_QListTypeDef

__DMA_QListTypeDef is defined in the stm32n6xx_hal_dma_ex.h

Data Fields

- ***DMA_NodeTypeDef * Head***
- ***DMA_NodeTypeDef * FirstCircularNode***
- ***uint32_t NodeNumber***
- ***__IO HAL_DMA_QStateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t Type***

Field Documentation

- ***DMA_NodeTypeDef* __DMA_QListTypeDef::Head***
  Specifies the queue head node
- ***DMA_NodeTypeDef* __DMA_QListTypeDef::FirstCircularNode***
  Specifies the queue first circular node
- ***uint32_t __DMA_QListTypeDef::NodeNumber***
  Specifies the queue node number
- ***__IO HAL_DMA_QStateTypeDef __DMA_QListTypeDef::State***
  Specifies the queue state
- ***__IO uint32_t __DMA_QListTypeDef::ErrorCode***
  Specifies the queue error code
- ***__IO uint32_t __DMA_QListTypeDef::Type***
  Specifies whether the queue is static or dynamic

20.1.7 DMA_NodeInQInfoTypeDef

DMA_NodeInQInfoTypeDef is defined in the stm32n6xx_hal_dma_ex.h

Data Fields

- ***uint32_t cllr_offset***
- ***uint32_t previousnode_addr***
- ***uint32_t currentnode_pos***
- ***uint32_t currentnode_addr***
- ***uint32_t nextnode_addr***

Field Documentation

- ***uint32_t DMA_NodeInQInfoTypeDef::cllr_offset***
- ***uint32_t DMA_NodeInQInfoTypeDef::previousnode_addr***
- ***uint32_t DMA_NodeInQInfoTypeDef::currentnode_pos***
- ***uint32_t DMA_NodeInQInfoTypeDef::currentnode_addr***
- ***uint32_t DMA_NodeInQInfoTypeDef::nextnode_addr***

20.2 DMAEx Firmware driver API description

The following section lists the various functions of the DMAEx library.

20.2.1 How to use this driver

Alternatively to the normal programming mode, a DMA channel can be programmed by a list of transfers, known as linked-list (list of Node items). Each node is defined by its data structure. Each node specifies a standalone DMA channel. When enabled, the DMA channel fetch the first linked-list node from SRAM (known as head node). When executed, the next linked list node will be fetched and executed. This operation is repeated until the end of the whole linked-list queue. Optionally, the linked-list can be linear where the last linked-list queue node is not linked to another queue node or circular where the last linked-list node is linked to any linked-list queue node.

- Linear linked-list: The DMA channel fetch and execute all DMA linked-list queue from first node (head node) to last node (tail node) ones. When the last node is completed, the DMA channel remains in idle state and another transfer can be lunched.
- Circular linked-list: The DMA channel fetch and execute all DMA linked-list queue from first node (head node) to last node (tail node). When last node is executed, the DMA channel fetches the first circular node another time and repeat the same sequence in an infinite loop (Circular transfer). To stop the DMA channel, an abort operation is required. This linked-list mode replaces the legacy circular transfers.

In order to reduce linked-list queue executing time and power consumption, the DMA channel supports executing the dynamic linked-list format. In fact, the DMA supports the execution of 2 types of linked-list formats : static and dynamic.

- Static linked-list: The static linked-list format refers to the full linked-list node where all DMA channel parameters are fetched and executed independently of the redundancy of information.
- Dynamic linked-list: The dynamic linked-list format refer to the customized linked-list node where only DMA channel necessary parameters are fetched and executed (Example: data size = 20 on previous node, and data size = 20 on the current node => No need to update it). For linked-list transfers, the DMA channel can execute the linked-list queue node by node. This feature is named link step mode. When activated, enabling the DMA channel first time allows to fetch the head node from memory then it stops. Then, another DMA channel enable is needed to execute the node. After that, keeping enabling the DMA channel is needed to execute each node until the end of linked-list queue. When the linked-list queue is circular, enabling the DMA channel in an infinite loop is required to keep the DMA channel running. This feature is useful for debug purpose or asynchronously executing queue nodes.

Each DMA channel transfer (normal or linked-list), is highly configurable according to DMA channel instance integrated in devices. These configuration can be :

- Repeated block configuration : If the feature is supported, the DMA channel can performs a repeated block transfers. Named also 2 dimension addressing transfers, this feature can transfer n iteration of programmed block transfer (Block transfer is the legacy data size). Additional to the repeat count of a block, DMA channel addresses can jump after at burst and block level. The jump length is a programmable parameter defined by DMA user.
  - Jump at burst level : The DMA channel keep an empty area, between each 2 consecutive bursts transmitted.
  - Jump at block level : The DMA channel keep an empty area, between each 2 consecutive blocks transmitted.
- Trigger : The DMA channel transfers can be conditioned by hardware signals edges (rising or falling) named hardware triggers. Trigger condition can be applied at :
  - Single/Burst level : Each single/burst data transmission is conditioned by a signal trigger hit.
  - Block level : Each block data transmission is conditioned by a signal trigger hit.
  - Repeated block level : Each repeated block data transmission is conditioned by a signal trigger hit.
  - Node level : Each node execution is conditioned by a signal trigger hit. The DMA channel can report a trigger overrun when detects more than 2 trigger signal edges before executing the current transfer.
- Data handling : The data handling feature is a FIFO capability that can be :
  - Padding pattern : Padding selected pattern (zero padding or sign extension) when the source data width is smaller than the destination data width at single level.
  - Truncation : Truncate section from the source data single when the source data width is bigger than the destination data width.
  - Pack/Unpack : Pack a set of data when source data width is smaller than the destination data width. Unpack a set of data when source data width is bigger than the destination data width.
  - Exchange : Exchange data at byte, half-word and word on the destination and at byte level on the source.

Each DMA channel transfer (normal or linked-list) when it is active, can be suspended and resumed at run time application. When trying to suspend an ongoing transfer, the DMA channel isn't suspended instantly but complete the current ongoing single/burst then it stops. When the DMA channel is suspended, the current transfer can be resumed instantly.

The DMA channel that supports FIFO, can report in real time the number of beats remains on destination (Output) FIFO level.

Linked-List Initialization and De-Initialization operation

Differently from normal transfers, DMA channel initialization and de-initialization need less parameters as the remaining transfer parameters are defined by linked-list nodes.

- Use HAL_DMAEx_List_Init() to initialize a DMA channel in linked-list mode according to programmed fields. When called, the DMA channel will be ready to execute linked-list queues.
- Use HAL_DMAEx_List_DeInit() to de-initialize a DMA channel in linked-list mode. When called, the DMA channel will be in reset. It is mandatory to reinitialize it for next transfer.

Linked-List I/O Operation

- Use HAL_DMAEx_List_Start() to start a DMA transfer in linked-list mode after the configuration of linked-list queue base address and offset in polling mode (Blocking mode).
- Use HAL_DMAEx_List_Start_IT() to start a DMA transfer in linked-list mode after the configuration of linked-list queue base address and offset in interrupt mode (Non-blocking mode).

Linked-List Management

The linked-list management is a software processing independently of DMA channel hardware. It allows to reset, build, create, insert, remove, replace, circularize, convert both nodes and queue in order to perform DMA channel transfers in linked-list mode. Linked-list APIs and types are adapted to reduce memory footprint.

Linked-list nodes building

At node level, the operations that can be done are building a new linked-list node or get a linked-list node information from a built node. The linked-list nodes have two forms according to 2 dimensions addressing capability. The linear addressing nodes contains the information of all DMA channel features except the 2 dimension addressing features and the 2 dimensions addressing nodes contain the information of all available features.

- Use HAL_DMAEx_List_BuildNode() to build the DMA linked-list node according to the specified parameters. Build operation allow to convert the specified parameter in values known by the DMA channel and place them in memory. Placing DMA linked-list in SRAM must be done in accordance to product specification to ensure that the link access port can access to the specified SRAM.
  - The DMA linked-list node parameter address should be 32bit aligned and should not exceed the 64 KByte addressable space.
- Use HAL_DMAEx_List_GetNodeConfig() to get the specified configuration parameter on building node. This API can be used when need to change few parameter to build new node.

Inserting nodes to linked-list queue

In order to build a sequence of DMA transaction with different configuration, we need to insert built node at linked-list queue (node present an elementary DMA transaction) in linked-list queue on any position to have the full flexibility of ordering nodes or extend the sequence of queue transactions.

- Use HAL_DMAEx_List_InsertNode() to insert new built node in any queue position of linked-list queue according to selecting previous node. When calling this API with previous node parameter is NULL, the inserted node will be placed at the head of the linked-list queue.
  - This API must be used after HAL_DMAEx_List_BuildNode() otherwise an error will be returned.
  - This API must be called for static queues format.
  - This API shall be avoided when adding new node at the head or the tail of queue (overhead of footprint and performance : use HAL_DMAEx_List_InsertNode_Head() or HAL_DMAEx_List_InsertNode_Tail() instead).

- Use HAL_DMAEx_List_InsertNode_Head() to insert new built node at the head of linked-list queue. The head node will not be overwritten but will be the second queue node.
  - This API must be used after HAL_DMAEx_List_BuildNode() otherwise an error will be returned.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_InsertNode_Tail() to insert new built node at the tail of linked-list queue. The tail node will not be overwritten but will be the penultimate queue node.
  - This API must be used after HAL_DMAEx_List_BuildNode() otherwise an error will be returned.
  - This API must be called for static queues format.

Removing nodes from linked-list queue

There is some cases when removing a node from linked-list queue is needed (need to remove an elementary DMA transaction). Removing node allows to unlink a node from DMA linked-list queue (NOT DELETED), so the removed node can be reused for another queue or to be added to the same queue without need to rebuild it in next step.

- Use HAL_DMAEx_List_RemoveNode() to remove any yet built and inserted node from linked-list queue according to selected node.
  - This API must be called for static queues format.
  - This API shall be avoided when removing the head or the tail of linked-list queue (overhead of footprint and performance : use HAL_DMAEx_List_RemoveNode_Head() or HAL_DMAEx_List_RemoveNode_Tail() instead).
- Use HAL_DMAEx_List_RemoveNode_Head() to remove the head node from linked-list queue.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_RemoveNode_Tail() to remove the tail node from linked-list queue.
  - This API must be called for static queues format.

Replacing nodes on linked-list queue

There is some cases when replacing a node from linked-list queue is needed (need to replace an elementary DMA transfer, by another one that have not the same configuration). Replacing node allows to unlink the node to be replaced from DMA linked-list queue (NOT DELETED) and link instead a new node. So the replaced node can be reused for another queue or to be added to the same queue without need to rebuild it in next step and the new node cannot be reused except when remove it or replaced in next step.

- Use HAL_DMAEx_List_ReplaceNode() to replace any yet built and inserted node on linked-list queue according to selected node.
  - This API must be called for static queues format.
  - This API shall be avoided when replacing the head or the tail linked-list queue (overhead of footprint and performance : use HAL_DMAEx_List_ReplaceNode_Head() or HAL_DMAEx_List_ReplaceNode_Tail() instead).
- Use HAL_DMAEx_List_ReplaceNode_Head() to replace the head node of linked-list queue.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_ReplaceNode_Tail() to replace the tail node from linked-list queue.
  - This API must be called for static queues format.

Reset linked-list queue

After finishing using a linked-list queue, it can be reset and cleared and it's content nodes will be unlinked (NOT DELETED) and reused on another queue.

- Use HAL_DMAEx_List_ResetQ() to reset a linked-list queue and unlink all it's content nodes.
  - This API must be called for ready state queues.
  - This API must be called for static queues format.

Inserting linked-list queue

To ensure the flexibility of building linked-list queue by their targeted functionalities (Example: 3 nodes for action 1 and 5 nodes for action 2), it is possible to build a queue for action 1 that contains action 1 nodes and a queue for action 2 that contains action 2 nodes then concatenating the 2 queues. So, there are some cases where the management of linked-list at queue granularity is needed.

- Use HAL_DMAEx_List_InsertQ() to insert source linked-list queue to a destination linked-list queue according to selecting previous node.
  - This API must be called for static queues format.
  - This API shall be avoided when inserting source linked-list queue at the head or the tail of destination queue (overhead of footprint and performance : use HAL_DMAEx_List_InsertQ_Head() or HAL_DMAEx_List_InsertQ_Tail() instead).
- Use HAL_DMAEx_List_InsertQ_Head() to insert a source linked-list queue at the head of linked-list destination queue.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_InsertQ_Tail() to insert a source linked-list queue at the tail of linked-list destination queue.
  - This API must be called for static queues format.

Circularizing linked-list queue

In order to perform tasks in infinite loop with DMA channel, it is possible to circularize the linked-list queues. Circularizing queue allows to link last linked-list queue node to any previous node of the same queue (This node is named first circular queue). When the first circular node is the head node, all linked-list queue nodes will be executed in infinite loop. When the first circular node is not the head nodes, all precedent nodes are executed once and all remaining nodes are executed in an infinite loop.

- Use HAL_DMAEx_List_SetCircularModeConfig() to circularize the linked-list queue according to first circular node selected.
  - This API must be called for static queues format.
  - This API shall be avoided when first circular node is the head linked-list queue node (overhead of footprint and performance : use HAL_DMAEx_List_SetCircularMode() instead).
- Use HAL_DMAEx_List_SetCircularMode() to circularize the linked-list queue with linking last queue node with first queue node.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_ClearCircularMode() to clear any linked-list queue circular configuration.
  - This API must be called for static queues format.

Converting linked-list queue

To have the best DMA channel linked-list queue execution, it is recommended to convert yet build linked-list queue to dynamic format (Static is the default format). When linked-list queue becomes dynamic, all queue nodes are optimized and only changed parameters will be updated between nodes. So, the DMA will fetch only changes parameters instead of the whole node.

- Use HAL_DMAEx_List_ConvertQToDynamic() to convert a linked-list queue to dynamic format.
  - This API must be called for ready state queues.
  - This API must be called for static queues format.
  - This API must be called as the last API before starting the DMA channel in linked-list mode.
- Use HAL_DMAEx_List_ConvertQToStatic() to convert a linked-list queue to static format.
  - This API must be called for ready state queues.
  - This API must be called for dynamic queues format.
  - This API must be called as the first API after the full execution of linked-list queue when the execution mode is linear (not circular) if it is dynamic and a linked-list queue management is needed.
  - This API must be called as the first API after the aborting the execution of the current linked-list queue when the execution mode is linear (not circular) if it is dynamic and a linked-list queue management is needed.

When converting a circular queue to dynamic format and when the first circular node is the last queue node, it is recommended to duplicate the last circular node in order to ensure the full optimization when calling HAL_DMAEx_List_ConvertQToDynamic() API. In this case, updated information are only addresses which allow to reduce 4 words of update for linear nodes per node execution and 6 words update for 2 dimensions addressing nodes per node execution.

Linking linked-list queue to DMA channel

In order to have the possibility of the creation of an infinity queues (limited by available memory size), the building of linked-list queue is fully independent from DMA channels. It is possible to build all needed queues if their size is less then available memory at startup time, then linking each time when needed a linked-list queue to an idle DMA channel.

- Use HAL_DMAEx_List_LinkQ() to link a ready linked-list queue to ready DMA channel.
  - This API supports the two format of linked-list (Static and dynamic).
  - This API must be called for ready state queues and DMA channels.
- Use HAL_DMAEx_List_ConvertQToStatic() to unlink a ready linked-list queue to ready DMA channel.
  - This API supports the two format of linked-list (Static and dynamic).
  - This API must be called for ready state queues and DMA channels.

User sequence

To use cleanly the DMA linked-list library, ensure to apply the following call sequences :

- Linear transfer : Linked-list queue building
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail() . . .
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail()
  - HAL_DMAEx_List_ConvertQToDynamic() Linked-list queue execution
  - HAL_DMAEx_List_Init()
  - HAL_DMAEx_List_LinkQ()
  - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
  - HAL_DMAEx_List_UnLinkQ()
  - HAL_DMAEx_List_DeInit()
- Circular transfer : Linked-list queue building
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail() . . .
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail()
  - HAL_DMAEx_List_SetCircularModeConfig() / HAL_DMAEx_List_SetCircularMode()
  - HAL_DMAEx_List_ConvertQToDynamic() Linked-list queue execution
  - HAL_DMAEx_List_Init()
  - HAL_DMAEx_List_LinkQ()
  - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
  - HAL_DMA_Abort() / HAL_DMA_Abort_IT()
  - HAL_DMAEx_List_UnLinkQ()
  - HAL_DMAEx_List_DeInit()

Data Handling

- In order to avoid some CPU data processing in several cases, the DMA channel provides some features related to FIFO capabilities titled data handling.
  - Padding pattern
  - Padding selected pattern (zero padding or sign extension) when the source data width is smaller than the destination data width at single level.
  - Zero padding
    - (Source : 0xABAB ------> Destination : 0xABAB0000)
  - Sign bit extension
    - (Source : 0x0ABA ------> Destination : 0x00000ABA)
    - (Source : 0xFABA ------> Destination : 0xFFFFFABA)
  - Truncation :
  - Truncate section from the source data single when the source data width is bigger than the destination data width.
  - Left truncation
    - (Source : 0xABABCDCD ------> Destination : 0xCDCD)
  - Right truncation
    - (Source : 0xABABCDCD ------> Destination : 0xABAB)
  - Pack/Unpack :
  - Pack a set of data when source data width is smaller than the destination data width.
  - Unpack a set of data when source data width is bigger than the destination data width.
  - Pack
    - (Source : 0xAB, 0xCD ------> Destination : 0xABCD)
  - UnPack
    - (Source : 0xABCD ------> Destination : 0xAB, 0xCD)
  - Exchange :
  - Exchange data at byte and half-word on the destination and at byte level on the source. Considering source and destination are both word type. Exchange operation can be as follows. In examples below, one exchange setting is enabled at a time.
  - Source byte exchange only
    - (Source : 0xAB12CD34 ------> Destination : 0xABCD1234)
  - Destination byte exchange only
    - (Source : 0xAB12CD34 ------> Destination : 0x12AB34CD)
  - Destination half-word exchange only
    - (Source : 0xAB12CD34 ------> Destination : 0xCD34AB12)
  - In addition, in case of double-word, Exchange data at word level on the destination is also available.
  - Considering source and destination are both double-word type. word exchange only
    - (Source : 0xAB12CD34EF567890 ------> Destination : 0xEF567890AB12CD34)
- Use HAL_DMAEx_ConfigDataHandling() to configure data handling features. Previous elementary explained can be combined according to application needs.
  - This API is complementary of normal transfers.
  - This API must not be called for linked-list transfers as data handling information are configured at node level.

User sequence

To configure cleanly the DMA channel data handling, ensure to apply the following call sequence :

- Linear transfer :
  - HAL_DMA_Init()
  - HAL_DMAEx_ConfigDataHandling()
  - HAL_DMA_Start()

Repeated Block

- When available, this feature is used when the data size is higher then 65535 bytes (Maximum block size) or for scattering / gathering data.
  - Gather data
    - Source Destination
    - 0xAA 0xBB 0xAA 0xCC 0xAA ==> 0xAA 0xAA 0xAA
  - Scatter data
    - Source Destination
    - 0xAA 0xAA 0xAA ==> 0xAA 0xBB 0xAA 0xBB 0xAA
- Use HAL_DMAEx_ConfigRepeatBlock() to configure data repeated block feature. Jump addresses and incrementing or decrementing on source and destination can be combined to have the need application behavior.
  - This API is complementary of normal transfers.
  - This API must not be called for linked-list transfers as repeated block information are configured at node level.
  - This API must be called only for DMA channel that supports repeated block feature.

User sequence

To configure cleanly the DMA channel repeated block, ensure to apply the following call sequence :

- Linear transfer :
  - HAL_DMA_Init()
  - HAL_DMAEx_ConfigRepeatBlock()
  - HAL_DMA_Start()

Trigger Configuration

When application needs that DMA transfers are conditioned by internal or external events, the trigger feature can do that. Trigger signals are a set of device signal that are linked to DMA trigger inputs that allows to start the DMA transfers. To setup a trigger transfers, three DMA channel parameters are needed:

- Trigger mode This parameter specifies the trig level.
  - Block level
  - Repeated block level
  - Node level
  - Single / Burst level
- Trigger polarity This parameter specifies the DMA trigger sensitivity (Rising or falling).
- Trigger selection This parameter specifies the DMA trigger hardware signal.
- Use HAL_DMAEx_ConfigTrigger() to configure trigger feature.
  - This API is complementary to normal transfers APIs.
  - This API must not be called for linked-list transfers as trigger information are configured at node level.

User sequence

To configure cleanly the DMA channel trigger, ensure to apply the following call sequence :

- Linear transfer :
  - HAL_DMA_Init()
  - HAL_DMAEx_ConfigTrigger()
  - HAL_DMA_Start()

Suspend and resume operation

There are several cases when needs to suspend a DMA current transfer (Example: liberate bandwidth for more priority DMA channel transfer). Suspending DMA channel (same as abort) is available in polling (blocking mode) and interrupt (non-blocking mode) modes. When suspended, a DMA channel can be instantly resumed.

- Use HAL_DMAEx_Suspend() to suspend an ongoing DMA channel transfer in polling mode (Blocking mode).
- Use HAL_DMAEx_Suspend_IT() to suspend an ongoing DMA channel transfer in interrupt mode (Non-blocking mode).
- Use HAL_DMAEx_Resume() to resume a suspended DMA channel transfer execution.

FIFO status

In several cases, the information of FIFO level is useful to inform at application level how to process remaining data. When not empty, the DMA channel FIFO cannot be flashed only by reset.

- Use HAL_DMAEx_GetFifoLevel() to get the DMA channel FIFO level (available beats in FIFO).

20.2.2 Linked-List Initialization and De-Initialization Functions

This section provides functions allowing to initialize and de-initialize the DMA channel in linked-list mode.

- The HAL_DMAEx_List_Init() function follows the DMA channel linked-list mode configuration procedures as described in reference manual.
- The HAL_DMAEx_List_DeInit() function allows to de-initialize the DMA channel in linked-list mode.

This section contains the following APIs:

- ***HAL_DMAEx_List_Init()***
- ***HAL_DMAEx_List_DeInit()***

20.2.3 Linked-List IO Operation Functions

This section provides functions allowing to :

- Configure to start DMA transfer in linked-list mode.
- The HAL_DMAEx_List_Start() function allows to start the DMA channel transfer in linked-list mode (Blocking mode).
- The HAL_DMAEx_List_Start_IT() function allows to start the DMA channel transfer in linked-list mode (Non-blocking mode).
  - It is mandatory to register a linked-list queue to be executed by a DMA channel before starting transfer otherwise a HAL_ERROR will be returned.

This section contains the following APIs:

- ***HAL_DMAEx_List_Start()***
- ***HAL_DMAEx_List_Start_IT()***

20.2.4 Linked-List Management Functions

This section provides functions allowing to :

- Build linked-list node.
- Get linked-list node configuration.
- Insert node to linked-list queue in any queue position.
- Remove any node from linked-list queue.
- Replace any node from linked-list queue.
- Reset linked-list queue.
- Insert linked-list queue in any queue position.
- Set circular mode configuration to linked-list queue.
- Clear circular mode configuration from linked-list queue.
- Convert static linked-list queue to dynamic format.
- Convert dynamic linked-list queue to static format.
- Link linked-list queue to DMA channel.
- Unlink linked-list queue from DMA channel.

- The HAL_DMAEx_List_BuildNode() function allows to build linked-list node. Node type can be :
  - 2 dimensions addressing node.
  - Linear addressing node.
- The HAL_DMAEx_List_GetNodeConfig() function allows to get the linked-list node configuration from built node.
- The HAL_DMAEx_List_InsertNode() function allows to insert built linked-list node to static linked-list queue according to selected position.
- The HAL_DMAEx_List_InsertNode_Head() and HAL_DMAEx_List_InsertNode_Tail() functions allow to insert built linked-list node to the head (respectively the tail) of static linked-list queue.
- The HAL_DMAEx_List_RemoveNode() function allows to remove selected built linked-list node from static linked-list queue.
- The HAL_DMAEx_List_RemoveNode_Head() and HAL_DMAEx_List_RemoveNode_Tail() functions allow to remove the head (respectively the tail) built linked-list node from static linked-list queue.
- The HAL_DMAEx_List_ReplaceNode() function allows to replace selected built linked-list node from static linked-list queue.
- The HAL_DMAEx_List_ReplaceNode_Head() and HAL_DMAEx_List_ReplaceNode_Tail() functions allow to replace the head (respectively the tail) built linked-list node of static linked-list queue.
- The HAL_DMAEx_List_ResetQ() function allows to reset static linked-list queue and unlink all built linked-list nodes.
- The HAL_DMAEx_List_InsertQ() function allows to insert static linked-list source queue to static linked-list destination queue according to selected position.
- The HAL_DMAEx_List_InsertQ_Head() and HAL_DMAEx_List_InsertQ_Tail() functions allow to insert static linked-list source queue to the head (respectively the tail) of static linked-list destination queue.
- The HAL_DMAEx_List_SetCircularModeConfig() function allows to link the last static linked-list queue node to the selected first circular node.
- The HAL_DMAEx_List_SetCircularMode() function allows to link the last static linked-list queue node to the first static linked-list queue node.
- The HAL_DMAEx_List_ClearCircularMode() function allows to unlink the last static linked-list queue node from any first circular node position.
- The HAL_DMAEx_List_ConvertQToDynamic() function allows to convert the static linked-list queue to dynamic format. (Optimized queue execution)
- The HAL_DMAEx_List_ConvertQToStatic() function allows to convert the dynamic linked-list queue to static format. (Not optimized queue execution)
- The HAL_DMAEx_List_LinkQ() function allows to link the (Dynamic / Static) linked-list queue to DMA channel to be executed.
- The HAL_DMAEx_List_UnLinkQ() function allows to unlink the (Dynamic / Static) linked-list queue from DMA channel when execution is completed.

This section contains the following APIs:

- ***HAL_DMAEx_List_BuildNode()***
- ***HAL_DMAEx_List_GetNodeConfig()***
- ***HAL_DMAEx_List_InsertNode()***
- ***HAL_DMAEx_List_InsertNode_Head()***
- ***HAL_DMAEx_List_InsertNode_Tail()***
- ***HAL_DMAEx_List_RemoveNode()***
- ***HAL_DMAEx_List_RemoveNode_Head()***
- ***HAL_DMAEx_List_RemoveNode_Tail()***
- ***HAL_DMAEx_List_ReplaceNode()***
- ***HAL_DMAEx_List_ReplaceNode_Head()***
- ***HAL_DMAEx_List_ReplaceNode_Tail()***
- ***HAL_DMAEx_List_ResetQ()***
- ***HAL_DMAEx_List_InsertQ()***
- ***HAL_DMAEx_List_InsertQ_Head()***
- ***HAL_DMAEx_List_InsertQ_Tail()***

- *HAL_DMAEx_List_SetCircularModeConfig()*
- *HAL_DMAEx_List_SetCircularMode()*
- *HAL_DMAEx_List_ClearCircularMode()*
- *HAL_DMAEx_List_ConvertQToDynamic()*
- *HAL_DMAEx_List_ConvertQToStatic()*
- *HAL_DMAEx_List_LinkQ()*
- *HAL_DMAEx_List_UnLinkQ()*

20.2.5 Data handling, repeated block and trigger configuration functions

This section provides functions allowing to :

- Configure DMA channel data handling.
- Configure DMA channel repeated block.
- Configure DMA channel trigger.
- The HAL_DMAEx_ConfigDataHandling() function allows to configure DMA channel data handling.
  - GPDMA or HPDMA data handling : byte-based reordering, packing/unpacking, padding/truncation, sign extension and left/right alignment.
- The HAL_DMAEx_ConfigTrigger() function allows to configure DMA channel HW triggers.
- The HAL_DMAEx_ConfigRepeatBlock() function allows to configure DMA channel repeated block.
  - This feature is available only for channel that supports 2 dimensions addressing capability.

This section contains the following APIs:

- *HAL_DMAEx_ConfigDataHandling()*
- *HAL_DMAEx_ConfigTrigger()*
- *HAL_DMAEx_ConfigRepeatBlock()*

20.2.6 Suspend and resume operation functions

This section provides functions allowing to :

- Suspend any ongoing DMA channel transfer.
- Resume any suspended DMA channel transfer.
- The HAL_DMAEx_Suspend() function allows to suspend any ongoing DMA channel transfer in polling mode (Blocking mode).
- The HAL_DMAEx_Suspend_IT() function allows to suspend any ongoing DMA channel transfer in interrupt mode (Non-blocking mode).
- The HAL_DMAEx_Resume() function allows to resume any suspended DMA channel transfer.

This section contains the following APIs:

- *HAL_DMAEx_Suspend()*
- *HAL_DMAEx_Suspend_IT()*
- *HAL_DMAEx_Resume()*

20.2.7 Fifo status function

This section provides function allowing to get DMA channel FIFO level.

- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  - This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:

- *HAL_DMAEx_GetFifoLevel()*

20.2.8 Detailed description of functions

HAL_DMAEx_List_Init

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Init (DMA_HandleTypeDef *const hdma)

Function description

Initialize the DMA channel in linked-list mode according to the specified parameters in the DMA_InitLinkedListTypeDef and create the associated handle.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_DeInit

Function name

HAL_StatusTypeDef HAL_DMAEx_List_DeInit (DMA_HandleTypeDef *const hdma)

Function description

DeInitialize the DMA channel when it is configured in linked-list mode.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_Start

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Start (DMA_HandleTypeDef *const hdma)

Function description

Start the DMA channel transfer in linked-list mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_Start_IT

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Start_IT (DMA_HandleTypeDef *const hdma)

Function description

Starts the DMA channel transfer in linked-list mode with interrupts enabled (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_BuildNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_BuildNode (DMA_NodeConfTypeDef const *const pNodeConfig, DMA_NodeTypeDef *const pNode)

Function description

Build a DMA channel node according to the specified parameters in the DMA_NodeConfTypeDef.

Parameters

- **pNodeConfig:** : Pointer to a DMA_NodeConfTypeDef structure that contains the configuration information for the specified DMA linked-list Node.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list node registers configurations.

Return values

- **HAL:** status.

Notes

- The DMA linked-list node parameter address should be 32bit aligned and should not exceed the 64 KByte addressable space.
- Warning if AXI port is selected with HPDMA, the maximum source (and destination) length should be less than 17. Otherwise, an error will be returned and no initialization performed.

HAL_DMAEx_List_GetNodeConfig

Function name

HAL_StatusTypeDef HAL_DMAEx_List_GetNodeConfig (DMA_NodeConfTypeDef *const pNodeConfig, DMA_NodeTypeDef const *const pNode)

Function description

Get a DMA channel node configuration.

Parameters

- **pNodeConfig:** : Pointer to a DMA_NodeConfTypeDef structure that contains the configuration information for the specified DMA linked-list Node.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pPrevNode, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node in any queue position of linked-list queue according to selecting previous node.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pPrevNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode_Head (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node at the head of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode_Tail (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node at the tail of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNode)

Function description

Remove node from any linked-list queue position.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode_Head (DMA_QListTypeDef *const pQList)

Function description

Remove the head node from linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode_Tail (DMA_QListTypeDef *const pQList)

Function description

Remove the tail node from linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pOldNode, DMA_NodeTypeDef *const pNewNode)

Function description

Replace node in linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pOldNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list old node registers configurations.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode_Head (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Replace the head node of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode_Tail (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Replace the tail node of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ResetQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ResetQ (DMA_QListTypeDef *const pQList)

Function description

Reset the linked-list queue and unlink queue nodes.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ (DMA_QListTypeDef *const pSrcQList, DMA_NodeTypeDef const *const pPrevNode, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue to a destination linked-list queue according to selecting previous node.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pPrevNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ_Head (DMA_QListTypeDef *const pSrcQList, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue at the head of destination queue.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ_Tail (DMA_QListTypeDef *const pSrcQList, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue at the tail of destination queue.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_SetCircularModeConfig

Function name

HAL_StatusTypeDef HAL_DMAEx_List_SetCircularModeConfig (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pFirstCircularNode)

Function description

Set circular mode configuration for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pFirstCircularNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list first circular node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_SetCircularMode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_SetCircularMode (DMA_QListTypeDef *const pQList)

Function description

Set circular mode for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ClearCircularMode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ClearCircularMode (DMA_QListTypeDef *const pQList)

Function description

Clear circular mode for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ConvertQToDynamic

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ConvertQToDynamic (DMA_QListTypeDef *const pQList)

Function description

Convert a linked-list queue to dynamic (Optimized DMA queue execution).

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ConvertQToStatic

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ConvertQToStatic (DMA_QListTypeDef *const pQList)

Function description

Convert a linked-list queue to static (Not optimized DMA queue execution).

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_LinkQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_LinkQ (DMA_HandleTypeDef *const hdma, DMA_QListTypeDef *const pQList)

Function description

Link linked-list queue to a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_UnLinkQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_UnLinkQ (DMA_HandleTypeDef *const hdma)

Function description

Unlink linked-list queue from a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigDataHandling

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigDataHandling (DMA_HandleTypeDef *const hdma, DMA_DataHandlingConfTypeDef const *const pConfigDataHandling)

Function description

Configure the DMA channel data handling according to the specified parameters in the DMA_DataHandlingConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigDataHandling:** : Pointer to a DMA_DataHandlingConfTypeDef structure that contains the data handling configuration.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigTrigger

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigTrigger (DMA_HandleTypeDef *const hdma, DMA_TriggerConfTypeDef const *const pConfigTrigger)

Function description

Configure the DMA channel trigger according to the specified parameters in the DMA_TriggerConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigTrigger:** : Pointer to a DMA_TriggerConfTypeDef structure that contains the trigger configuration.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigRepeatBlock

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigRepeatBlock (DMA_HandleTypeDef *const hdma, DMA_RepeatBlockConfTypeDef const *const pConfigRepeatBlock)

Function description

Configure the DMA channel repeated block according to the specified parameters in the DMA_RepeatBlockConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigRepeatBlock:** : Pointer to a DMA_RepeatBlockConfTypeDef structure that contains the repeated block configuration.

Return values

- **HAL:** status.

HAL_DMAEx_Suspend

Function name

HAL_StatusTypeDef HAL_DMAEx_Suspend (DMA_HandleTypeDef *const hdma)

Function description

Suspend any ongoing DMA channel transfer in polling mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA channel.

Return values

- **HAL:** status.

Notes

- After suspending a DMA channel, a check for wait until the DMA channel is effectively suspended is added. If a channel is suspended while a data transfer is ongoing, the current data will be transferred and the channel will be effectively suspended only after the transfer of this single/burst data is finished.

HAL_DMAEx_Suspend_IT

Function name

HAL_StatusTypeDef HAL_DMAEx_Suspend_IT (DMA_HandleTypeDef *const hdma)

Function description

Suspend any ongoing DMA channel transfer in polling mode (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_Resume

Function name

HAL_StatusTypeDef HAL_DMAEx_Resume (DMA_HandleTypeDef *const hdma)

Function description

Resume any suspended DMA channel transfer.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_GetFifoLevel

Function name

uint32_t HAL_DMAEx_GetFifoLevel (DMA_HandleTypeDef const *const hdma)

Function description

Get and returns the DMA channel FIFO level.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **Returns:** the number of available beats in FIFO.

20.3 DMAEx Firmware driver defines

The following section lists the various define and macros of the module.

20.3.1 DMAEx

DMAEx

DMAEx Data Alignment

DMA_DATA_RIGHTALIGN_ZEROPADDED

If source data width < destination data width => Right aligned padded with 0 up to destination data width

DMA_DATA_RIGHTALIGN_LEFTTRUNC

If source data width > destination data width => Right aligned left Truncated down to destination data width

DMA_DATA_RIGHTALIGN_SIGNEXT

If source data width < destination data width => Right Aligned padded with sign extended up to destination data width

DMA_DATA_LEFTALIGN_RIGHTTRUNC

If source data width > destination data width => Left Aligned Right Truncated down to the destination data width

DMA_DATA_PACK

If source data width < destination data width => Packed at the destination data width

DMA_DATA_UNPACK

If source data width > destination data width => Unpacked at the destination data width

DMAEx Data Exchange

DMA_EXCHANGE_NONE

No data exchange

DMA_EXCHANGE_DEST_BYTE

Destination Byte exchange when destination data width is > Byte

DMA_EXCHANGE_DEST_HALFWORD

Destination Half-Word exchange when destination data width is > Half-Word

DMA_EXCHANGE_SRC_BYTE

Source Byte endianness exchange when source data width is word

DMA_EXCHANGE_DEST_WORD

Destination Word exchange when destination data width is > Word

DMAEx LinkedList Mode

DMA_LINKEDLIST_NORMAL

Linear linked-list DMA channel transfer

DMA_LINKEDLIST_CIRCULAR

Circular linked-list DMA channel transfer

DMAEx Linked-List Allocated Port

DMA_LINK_ALLOCATED_PORT0

Link allocated port 0

DMA_LINK_ALLOCATED_PORT1

Link allocated port 1

DMAEx Link Step Mode

DMA_LSM_FULL_EXECUTION

Channel is executed for the full linked-list

DMA_LSM_1LINK_EXECUTION

Channel is executed once for the current LLI

DMAEx Node Type

DMA_GPDMA_LINEAR_NODE

Defines the GPDMA linear addressing node type

DMA_GPDMA_2D_NODE

Defines the GPDMA 2 dimension addressing node type

DMA_HPDMA_LINEAR_NODE

Defines the HPDMA linear addressing node type

DMA_HPDMA_2D_NODE

Defines the HPDMA 2 dimension addressing node type

DMAEx Trigger Mode

DMA_TRIGM_BLOCK_TRANSFER

A block transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_REPEATED_BLOCK_TRANSFER

A repeated block transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_LLI_LINK_TRANSFER

A LLI link transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_SINGLE_BURST_TRANSFER

A single/burst transfer is conditioned by (at least) one hit trigger

DMAEx Trigger Polarity

DMA_TRIG_POLARITY_MASKED

No trigger of the selected DMA request. Masked trigger event

DMA_TRIG_POLARITY_RISING

Trigger of the selected DMA request on the rising edge of the selected trigger event input

DMA_TRIG_POLARITY_FALLING

Trigger of the selected DMA request on the falling edge of the selected trigger event input

DMAEx Trigger Selection

HPDMA1_TRIGGER_DCMIPP_P0_FEND

HPDMA1 HW Trigger signal is DCMIPP_P0_FEND

HPDMA1_TRIGGER_DCMIPP_P0_LEND

HPDMA1 HW Trigger signal is DCMIPP_P0_LEND

HPDMA1_TRIGGER_DCMIPP_P0_HSYNC

HPDMA1 HW Trigger signal is DCMIPP_P0_HSYNC

HPDMA1_TRIGGER_DCMIPP_P0_VSYNC

HPDMA1 HW Trigger signal is DCMIPP_P0_VSYNC

HPDMA1_TRIGGER_DCMIPP_P1_FEND

HPDMA1 HW Trigger signal is DCMIPP_P1_FEND

HPDMA1_TRIGGER_DCMIPP_P1_LEND

HPDMA1 HW Trigger signal is DCMIPP_P1_LEND

HPDMA1_TRIGGER_DCMIPP_P1_HSYNC

HPDMA1 HW Trigger signal is DCMIPP_P1_HSYNC

HPDMA1_TRIGGER_DCMIPP_P1_VSYNC

HPDMA1 HW Trigger signal is DCMIPP_P1_VSYNC

HPDMA1_TRIGGER_DCMIPP_P2_FEND

HPDMA1 HW Trigger signal is DCMIPP_P2_FEND

HPDMA1_TRIGGER_DCMIPP_P2_LEND

HPDMA1 HW Trigger signal is DCMIPP_P2_LEND

HPDMA1_TRIGGER_DCMIPP_P2_HSYNC

HPDMA1 HW Trigger signal is DCMIPP_P2_HSYNC

HPDMA1_TRIGGER_DCMIPP_P2_VSYNC

HPDMA1 HW Trigger signal is DCMIPP_P2_VSYNC

HPDMA1_TRIGGER_DMA2D_CTC

HPDMA1 HW Trigger signal is DMA2D_CTC

HPDMA1_TRIGGER_DMA2D_TC

HPDMA1 HW Trigger signal is DMA2D_TC

HPDMA1_TRIGGER_DMA2D_TW

HPDMA1 HW Trigger signal is DMA2D_TW

HPDMA1_TRIGGER_JPEG_EOC

HPDMA1 HW Trigger signal is JPEG_EOC

HPDMA1_TRIGGER_JPEG_IFNF

HPDMA1 HW Trigger signal is JPEG_IFNF

HPDMA1_TRIGGER_JPEG_IFT

HPDMA1 HW Trigger signal is JPEG_IFT

HPDMA1_TRIGGER_JPEG_OFNE

HPDMA1 HW Trigger signal is JPEG_OFNE

HPDMA1_TRIGGER_JPEG_OFT

HPDMA1 HW Trigger signal is JPEG_OFT

HPDMA1_LCD_LI

HPDMA1 HW Trigger signal is LCD_LI

HPDMA1_TRIGGER_GPU2D1_GP_0

HPDMA1 HW Trigger signal is GPU2D1_GP_0

HPDMA1_TRIGGER_GPU2D1_GP_1

HPDMA1 HW Trigger signal is GPU2D1_GP_1

HPDMA1_TRIGGER_GPU2D1_GP_2

HPDMA1 HW Trigger signal is GPU2D1_GP_2

HPDMA1_TRIGGER_GPU2D1_GP_3

HPDMA1 HW Trigger signal is GPU2D1_GP_3

HPDMA1_TRIGGER_GFXTIM_3

HPDMA1 HW Trigger signal is GFXTIM_3

HPDMA1_TRIGGER_GFXTIM_2

HPDMA1 HW Trigger signal is GFXTIM_2

HPDMA1_TRIGGER_GFXTIM_1

HPDMA1 HW Trigger signal is GFXTIM_1

HPDMA1_TRIGGER_GFXTIM_0

HPDMA1 HW Trigger signal is GFXTIM_0

HPDMA1_TRIGGER_LPTIM1_CH1

HPDMA1 HW Trigger signal is LPTIM1_CH1

HPDMA1_TRIGGER_LPTIM1_CH2

HPDMA1 HW Trigger signal is LPTIM1_CH2

HPDMA1_TRIGGER_LPTIM2_CH1

HPDMA1 HW Trigger signal is LPTIM2_CH1

HPDMA1_TRIGGER_LPTIM2_CH2

HPDMA1 HW Trigger signal is LPTIM2_CH2

HPDMA1_TRIGGER_LPTIM3_CH1

HPDMA1 HW Trigger signal is LPTIM3_CH1

HPDMA1_TRIGGER_LPTIM3_CH2

HPDMA1 HW Trigger signal is LPTIM3_CH2

HPDMA1_TRIGGER_LPTIM4_OUT

HPDMA1 HW Trigger signal is LPTIM4_OUT

HPDMA1_TRIGGER_LPTIM5_OUT

HPDMA1 HW Trigger signal is LPTIM5_OUT

HPDMA1_TRIGGER_RTC_WKUP

HPDMA1 HW Trigger signal is RTC_WKUP

HPDMA1_TRIGGER_LPUART1_IT_R_WUP_ASYNC

HPDMA1 HW Trigger signal is IT_R_WUP_ASYNC

HPDMA1_TRIGGER_LPUART1_IT_T_WUP_ASYNC

HPDMA1 HW Trigger signal is IT_T_WUP_ASYNC

HPDMA1_TRIGGER_SPI6_IT_OR_SPI6_AIT_SYNC

HPDMA1 HW Trigger signal is SPI6_IT_OR_SPI6_AIT_SYNC

HPDMA1_TRIGGER_TIM1_TRGO

HPDMA1 HW Trigger signal is TIM1_TRGO

HPDMA1_TRIGGER_TIM1_TRGO2

HPDMA1 HW Trigger signal is TIM1_TRGO2

HPDMA1_TRIGGER_TIM2_TRGO

HPDMA1 HW Trigger signal is TIM2_TRGO

HPDMA1_TRIGGER_TIM3_TRGO

HPDMA1 HW Trigger signal is TIM3_TRGO

HPDMA1_TRIGGER_TIM4_TRGO

HPDMA1 HW Trigger signal is TIM4_TRGO

HPDMA1_TRIGGER_TIM5_TRGO

HPDMA1 HW Trigger signal is TIM5_TRGO

HPDMA1_TRIGGER_TIM6_TRGO

HPDMA1 HW Trigger signal is TIM6_TRGO

HPDMA1_TRIGGER_TIM7_TRGO

HPDMA1 HW Trigger signal is TIM7_TRGO

HPDMA1_TRIGGER_TIM8_TRGO

HPDMA1 HW Trigger signal is TIM8_TRGO

HPDMA1_TRIGGER_TIM8_TRGO2

HPDMA1 HW Trigger signal is TIM8_TRGO2

HPDMA1_TRIGGER_TIM12_TRGO

HPDMA1 HW Trigger signal is TIM12_TRGO

HPDMA1_TRIGGER_TIM15_TRGO

HPDMA1 HW Trigger signal is TIM15_TRGO

HPDMA1_TRIGGER_HPDMA1_CH0_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH0_TCF

HPDMA1_TRIGGER_HPDMA1_CH1_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH1_TCF

HPDMA1_TRIGGER_HPDMA1_CH2_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH2_TCF

HPDMA1_TRIGGER_HPDMA1_CH3_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH3_TCF

HPDMA1_TRIGGER_HPDMA1_CH4_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH4_TCF

HPDMA1_TRIGGER_HPDMA1_CH5_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH5_TCF

HPDMA1_TRIGGER_HPDMA1_CH6_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH6_TCF

HPDMA1_TRIGGER_HPDMA1_CH7_TCF

HPDMA1 HW Trigger signal is HPDMA1_CH7_TCF

HPDMA1_TRIGGER_HPDMA1_CH8_TCF

  DTS MSP de-init callback
- ***void(* __DTS_HandleTypeDef::TemperatureCallback)(struct __DTS_HandleTypeDef *hdts, HAL_DTS_Sensor Sensor)***
  DTS temperature callback
- ***void(* __DTS_HandleTypeDef::AlarmACallback)(struct __DTS_HandleTypeDef *hdts, HAL_DTS_Sensor Sensor)***
  DTS alarm A callback
- ***void(* __DTS_HandleTypeDef::AlarmBCallback)(struct __DTS_HandleTypeDef *hdts, HAL_DTS_Sensor Sensor)***
  DTS alarm B callback
- ***void(* __DTS_HandleTypeDef::ErrorCallback)(struct __DTS_HandleTypeDef *hdts, HAL_DTS_Sensor Sensor)***
  DTS error callback

21.1.2 DTS_SensorConfigTypeDef

DTS_SensorConfigTypeDef is defined in the stm32n6xx_hal_dts.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t Resolution***
- ***uint32_t Trigger***

Field Documentation

- ***uint32_t DTS_SensorConfigTypeDef::Mode***
  Sensor mode. This parameter can be a value of ***DTS_SensorMode***
- ***uint32_t DTS_SensorConfigTypeDef::Resolution***
  Sensor resolution. This parameter can be a value of ***DTS_SensorResolution***
- ***uint32_t DTS_SensorConfigTypeDef::Trigger***
  Sensor trigger. This parameter can be a value of ***DTS_SensorTrigger***.
  Note:
  – This parameter is used only if Mode is set to DTS_SENSOR_MODE_TRIGGER

21.1.3 DTS_AlarmConfigTypeDef

DTS_AlarmConfigTypeDef is defined in the stm32n6xx_hal_dts.h

Data Fields

- ***FunctionalState Enable***
- ***float_t Threshold***
- ***float_t Hysteresis***

Field Documentation

- ***FunctionalState DTS_AlarmConfigTypeDef::Enable***
  Alarm enable/disable
- ***float_t DTS_AlarmConfigTypeDef::Threshold***
  Alarm threshold in celsius degree. This parameter must be a number between Min_Data = -40 and Max_Data = 125
- ***float_t DTS_AlarmConfigTypeDef::Hysteresis***
  Alarm hysteresis in celsius degree. This parameter must be a number between Min_Data = -40 and Max_Data = 125

21.2 DTS Firmware driver API description

The following section lists the various functions of the DTS library.

21.2.1 How to use this driver

The DTS hardware IP is a high-precision low-power junction temperature sensor (TS). It is composed of a configurable controller plus two embedded temperature sensors. In addition of temperature measurements, we have following features for each temperature sensor:

- Two programmable alarms incorporating hysteresis.
- Recording of the minimum and maximum temperatures measured. A sample counter is also available.

Initialization and de-initialization

1. User has first to initialize DTS instance.
2. As prerequisite, fill in the HAL_DTS_MspInit():
   – Enable DTS clock interface with __HAL_RCC_DTS_CLK_ENABLE().
   – If interrupt mode is used, enable and configure DTS interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
3. Call HAL_DTS_Init() function.
1. User can de-initialize DTS instance with HAL_DTS_DeInit() function.

Temperature measurement

1. Configure senors using HAL_DTS_ConfigSensor() for each sensor.
2. In polling mode:
   – Use HAL_DTS_Start() to start temperature measurement.
   – Use HAL_DTS_PollForTemperature() to detect the end of measurement. Use HAL_DTS_GetTemperature to get measured temperature.

3. In interrupt mode:
   – Use HAL_DTS_Start_IT() to start temperature measurement.
   – HAL_DTS_TemperatureCallback() will be called at the end of measurement. Use HAL_DTS_GetTemperature to get measured temperature.
4. Use HAL_DTS_GetExtremeTemperatures() to get the extreme measured temperatures.
5. Stop measurement using HAL_DTS_Stop() or HAL_DTS_Stop_IT().
6. Configure sample counter using HAL_DTS_ConfigSampleCounter().
7. Get sample counter value using HAL_DTS_GetSampleCounter().
8. Activate sample discard using HAL_DTS_ConfigSampleDiscard().

Alarms usage

1. Configure alarms using HAL_DTS_ConfigAlarmX() for each sensor (X is A or B). (#] HAL_DTS_AlarmXCallback() will be called when alarm X occurs (X is A or B).
2. Disable alarms using HAL_DTS_ConfigAlarmX() (X is A or B).

generic functions

1. HAL_DTS_IRQHandler will be called when DTS interrupt occurs.
2. HAL_DTS_ErrorCallback will be called when DTS error occurs.
3. Use HAL_DTS_GetState() to get the current DTS instance state.

Callback registration

The compilation define USE_HAL_DTS_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_DTS_RegisterCallback() to register a user callback.

Functions HAL_DTS_RegisterCallback() and HAL_DTS_UnRegisterCallback allow to register and unregister following callbacks:

- MspInitCallback : MSP init callback.
- MspDeInitCallback : MSP de-init callback.

For temperature measurement complete callback use dedicated register and unregister callback functions:

- HAL_DTS_RegisterTemperatureCallback().
- HAL_DTS_UnRegisterTemperatureCallback().

For alarms callback use dedicated register and unregister callback functions:

- HAL_DTS_RegisterAlarmACallback().
- HAL_DTS_RegisterAlarmBCallback().
- HAL_DTS_UnRegisterAlarmACallback().
- HAL_DTS_UnRegisterAlarmBCallback().

For error callback use dedicated register and unregister callback functions:

- HAL_DTS_RegisterErrorCallback().
- HAL_DTS_UnRegisterErrorCallback().

By default, after the call of init function and if the state is RESET all callbacks are reset to the corresponding legacy weak functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the init and de-init only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the init and de-init keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the init/de-init. In that case first register the MspInit/MspDeInit user callbacks using HAL_DTS_RegisterCallback() before calling init or de-init function.

When the compilation define USE_HAL_DTS_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

21.2.2 Detailed description of functions

HAL_DTS_Init

Function name

HAL_StatusTypeDef HAL_DTS_Init (DTS_HandleTypeDef * hdts)

Function description

HAL_DTS_DeInit

Function name

HAL_StatusTypeDef HAL_DTS_DeInit (DTS_HandleTypeDef * hdts)

Function name

uint32_t HAL_DTS_GetError (const DTS_HandleTypeDef * hdts)

Function description

21.3 DTS Firmware driver defines

The following section lists the various define and macros of the module.

21.3.1 DTS

DTS

DTS error code

HAL_DTS_ERROR_NONE

No error

HAL_DTS_ERROR_INVALID_PARAM

Invalid parameter

HAL_DTS_ERROR_INVALID_STATE

Invalid state

HAL_DTS_ERROR_INVALID_SENSOR_MODE

Invalid sensor mode

HAL_DTS_ERROR_INVALID_SAMPLE

Invalid sample

HAL_DTS_ERROR_FAULT

Fault

HAL_DTS_ERROR_INVALID_CALLBACK

Invalid callback error

DTS Exported Macros

__HAL_DTS_RESET_HANDLE_STATE

IS_DTS_SENSOR_MODE

IS_DTS_SENSOR_RESOLUTION

IS_DTS_SENSOR_TRIGGER

IS_DTS_ALARM_PARAM

DTS sensor mode

DTS_SENSOR_MODE_DISABLE

No acquisition

DTS_SENSOR_MODE_SINGLE

Single acquisition

DTS_SENSOR_MODE_CONTINUOUS

Continuous acquisitions

DTS_SENSOR_MODE_TRIGGER

Acquisition with trigger

DTS sensor resolution

DTS_SENSOR_RESOLUTION_12BITS

Sensor resolution of 12 bits

DTS_SENSOR_RESOLUTION_10BITS

Sensor resolution of 10 bits

DTS_SENSOR_RESOLUTION_8BITS

Sensor resolution of 8 bits

DTS sensor trigger

DTS_SENSOR_TRIGGER_LPTIM4_OUT

LPTIM4 output signal

DTS_SENSOR_TRIGGER_LPTIM2_CH1

LPTIM2 channel 1 signal

DTS_SENSOR_TRIGGER_LPTIM3_CH1

LPTIM3 channel 1 signal

DTS_SENSOR_TRIGGER_EXTI13

EXTI13 signal

22 HAL ETH Generic Driver

22.1 ETH Firmware driver registers structures

22.1.1 ETH_DMADescTypeDef

ETH_DMADescTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***__IO uint32_t DESC0***
- ***__IO uint32_t DESC1***

- ***uint32_t ETH_TxDescListTypeDef::CurTxDesc***
- ***uint32_t* ETH_TxDescListTypeDef::PacketAddress[ETH_TX_DESC_CNT]***
- ***uint32_t* ETH_TxDescListTypeDef::CurrentPacketAddress***
- ***uint32_t ETH_TxDescListTypeDef::BuffersInUse***
- ***uint32_t ETH_TxDescListTypeDef::releaseIndex***

22.1.4 ETH_TxPacketConfigTypeDef

ETH_TxPacketConfigTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***uint32_t TxDMACh***
- ***uint32_t Attributes***
- ***uint32_t Length***
- ***ETH_BufferTypeDef * TxBuffer***
- ***uint32_t SrcAddrCtrl***
- ***uint32_t CRCPadCtrl***
- ***uint32_t ChecksumCtrl***
- ***uint32_t MaxSegmentSize***
- ***uint32_t PayloadLen***
- ***uint32_t TCPHeaderLen***
- ***uint32_t VlanTag***
- ***uint32_t VlanCtrl***
- ***uint32_t InnerVlanTag***
- ***uint32_t InnerVlanCtrl***
- ***void * pData***

Field Documentation

- ***uint32_t ETH_TxPacketConfigTypeDef::TxDMACh***
  Sets the Tx Queue/Channel which will transmit the packet
- ***uint32_t ETH_TxPacketConfigTypeDef::Attributes***
  Tx packet HW features capabilities. This parameter can be a combination of ***ETH_Tx_Packet_Attributes***
- ***uint32_t ETH_TxPacketConfigTypeDef::Length***
  Total packet length
- ***ETH_BufferTypeDef* ETH_TxPacketConfigTypeDef::TxBuffer***
  Tx buffers pointers
- ***uint32_t ETH_TxPacketConfigTypeDef::SrcAddrCtrl***
  Specifies the source address insertion control. This parameter can be a value of ***ETH_Tx_Packet_Source_Addr_Control***
- ***uint32_t ETH_TxPacketConfigTypeDef::CRCPadCtrl***
  Specifies the CRC and Pad insertion and replacement control. This parameter can be a value of ***ETH_Tx_Packet_CRC_Pad_Control***
- ***uint32_t ETH_TxPacketConfigTypeDef::ChecksumCtrl***
  Specifies the checksum insertion control. This parameter can be a value of ***ETH_Tx_Packet_Checksum_Control***
- ***uint32_t ETH_TxPacketConfigTypeDef::MaxSegmentSize***
  Sets TCP maximum segment size only when TCP segmentation is enabled. This parameter can be a value from 0x0 to 0x3FFF
- ***uint32_t ETH_TxPacketConfigTypeDef::PayloadLen***
  Sets Total payload length only when TCP segmentation is enabled. This parameter can be a value from 0x0 to 0x3FFFF
- ***uint32_t ETH_TxPacketConfigTypeDef::TCPHeaderLen***
  Sets TCP header length only when TCP segmentation is enabled. This parameter can be a value from 0x5 to 0xF
- ***uint32_t ETH_TxPacketConfigTypeDef::VlanTag***
  Sets VLAN Tag only when VLAN is enabled. This parameter can be a value from 0x0 to 0xFFFF
- ***uint32_t ETH_TxPacketConfigTypeDef::VlanCtrl***
  Specifies VLAN Tag insertion control only when VLAN is enabled. This parameter can be a value of ***ETH_Tx_Packet_VLAN_Control***
- ***uint32_t ETH_TxPacketConfigTypeDef::InnerVlanTag***
  Sets Inner VLAN Tag only when Inner VLAN is enabled. This parameter can be a value from 0x0 to 0x3FFFF

- ***uint32_t ETH_TxPacketConfigTypeDef::InnerVlanCtrl***
  Specifies Inner VLAN Tag insertion control only when Inner VLAN is enabled. This parameter can be a value of ***ETH_Tx_Packet_Inner_VLAN_Control***
- ***void* ETH_TxPacketConfigTypeDef::pData***
  Specifies Application packet pointer to save

22.1.5 ETH_TimeStampTypeDef

ETH_TimeStampTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***uint32_t TimeStampLow***
- ***uint32_t TimeStampHigh***

Field Documentation

- ***uint32_t ETH_TimeStampTypeDef::TimeStampLow***
- ***uint32_t ETH_TimeStampTypeDef::TimeStampHigh***

22.1.6 ETH_RxDescListTypeDef

ETH_RxDescListTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***uint32_t RxDesc***
- ***uint32_t ItMode***
- ***uint32_t RxDescIdx***
- ***uint32_t RxDescCnt***
- ***uint32_t RxDataLength***
- ***uint32_t RxBuildDescIdx***
- ***uint32_t RxBuildDescCnt***
- ***uint32_t pRxLastRxDesc***
- ***ETH_TimeStampTypeDef TimeStamp***
- ***void * pRxStart***
- ***void * pRxEnd***

Field Documentation

- ***uint32_t ETH_RxDescListTypeDef::RxDesc[ETH_RX_DESC_CNT]***
- ***uint32_t ETH_RxDescListTypeDef::ItMode***
- ***uint32_t ETH_RxDescListTypeDef::RxDescIdx***
- ***uint32_t ETH_RxDescListTypeDef::RxDescCnt***
- ***uint32_t ETH_RxDescListTypeDef::RxDataLength***
- ***uint32_t ETH_RxDescListTypeDef::RxBuildDescIdx***
- ***uint32_t ETH_RxDescListTypeDef::RxBuildDescCnt***
- ***uint32_t ETH_RxDescListTypeDef::pRxLastRxDesc***
- ***ETH_TimeStampTypeDef ETH_RxDescListTypeDef::TimeStamp***
- ***void* ETH_RxDescListTypeDef::pRxStart***
- ***void* ETH_RxDescListTypeDef::pRxEnd***

22.1.7 ETH_MACConfigTypeDef

ETH_MACConfigTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***uint32_t SourceAddrControl***
- ***FunctionalState ChecksumOffload***
- ***uint32_t InterPacketGapVal***
- ***FunctionalState GiantPacketSizeLimitControl***
- ***FunctionalState Support2KPacket***

- ***FunctionalState CRCStripTypePacket***
- ***FunctionalState AutomaticPadCRCStrip***
- ***FunctionalState Watchdog***
- ***FunctionalState Jabber***
- ***FunctionalState JumboPacket***
- ***FunctionalState PortSelect***
- ***uint32_t Speed***
- ***uint32_t DuplexMode***
- ***FunctionalState LoopbackMode***
- ***FunctionalState CarrierSenseBeforeTransmit***
- ***FunctionalState ReceiveOwn***
- ***FunctionalState CarrierSenseDuringTransmit***
- ***FunctionalState RetryTransmission***
- ***uint32_t BackOffLimit***
- ***FunctionalState DeferralCheck***
- ***uint32_t PreambleLength***
- ***FunctionalState UnicastSlowProtocolPacketDetect***
- ***FunctionalState SlowProtocolDetect***
- ***FunctionalState CRCCheckingRxPackets***
- ***uint32_t GiantPacketSizeLimit***
- ***FunctionalState ExtendedInterPacketGap***
- ***uint32_t ExtendedInterPacketGapVal***
- ***FunctionalState ProgrammableWatchdog***
- ***uint32_t WatchdogTimeout***
- ***uint32_t PauseTime***
- ***FunctionalState ZeroQuantaPause***
- ***uint32_t PauseLowThreshold***
- ***FunctionalState TransmitFlowControl***
- ***FunctionalState UnicastPausePacketDetect***
- ***FunctionalState ReceiveFlowControl***
- ***FunctionalState PacketBurst***

Field Documentation

- ***uint32_t ETH_MACConfigTypeDef::SourceAddrControl***
  Selects the Source Address Insertion or Replacement Control. This parameter can be a value of *ETH_Source_Addr_Control*
- ***FunctionalState ETH_MACConfigTypeDef::ChecksumOffload***
  Enables or Disable the checksum checking for received packet payloads TCP, UDP or ICMP headers
- ***uint32_t ETH_MACConfigTypeDef::InterPacketGapVal***
  Sets the minimum IPG between Packet during transmission. This parameter can be a value of *ETH_Inter_Packet_Gap*
- ***FunctionalState ETH_MACConfigTypeDef::GiantPacketSizeLimitControl***
  Enables or disables the Giant Packet Size Limit Control.
- ***FunctionalState ETH_MACConfigTypeDef::Support2KPacket***
  Enables or disables the IEEE 802.3as Support for 2K length Packets
- ***FunctionalState ETH_MACConfigTypeDef::CRCStripTypePacket***
  Enables or disables the CRC stripping for Type packets.
- ***FunctionalState ETH_MACConfigTypeDef::AutomaticPadCRCStrip***
  Enables or disables the Automatic MAC Pad/CRC Stripping.
- ***FunctionalState ETH_MACConfigTypeDef::Watchdog***
  Enables or disables the Watchdog timer on Rx path.
- ***FunctionalState ETH_MACConfigTypeDef::Jabber***
  Enables or disables Jabber timer on Tx path.

- ***FunctionalState ETH_MACConfigTypeDef::JumboPacket***
  Enables or disables receiving Jumbo Packet When enabled, the MAC allows jumbo packets of 9,018 bytes without reporting a giant packet error
- ***FunctionalState ETH_MACConfigTypeDef::PortSelect***
  Sets the Port Select When disabled, the line speed is for 1000Mbps operations When enabled, it is for 10 or 100Mbps operations
- ***uint32_t ETH_MACConfigTypeDef::Speed***
  Sets the Ethernet speed: 10/100 Mbps. This parameter can be a value of ***ETH_Speed***
- ***uint32_t ETH_MACConfigTypeDef::DuplexMode***
  Selects the MAC duplex mode: Half-Duplex or Full-Duplex mode This parameter can be a value of ***ETH_Duplex_Mode***
- ***FunctionalState ETH_MACConfigTypeDef::LoopbackMode***
  Enables or disables the loopback mode
- ***FunctionalState ETH_MACConfigTypeDef::CarrierSenseBeforeTransmit***
  Enables or disables the Carrier Sense Before Transmission in Full Duplex Mode.
- ***FunctionalState ETH_MACConfigTypeDef::ReceiveOwn***
  Enables or disables the Receive Own in Half Duplex mode.
- ***FunctionalState ETH_MACConfigTypeDef::CarrierSenseDuringTransmit***
  Enables or disables the Carrier Sense During Transmission in the Half Duplex mode
- ***FunctionalState ETH_MACConfigTypeDef::RetryTransmission***
  Enables or disables the MAC retry transmission, when a collision occurs in Half Duplex mode.
- ***uint32_t ETH_MACConfigTypeDef::BackOffLimit***
  Selects the BackOff limit value. This parameter can be a value of ***ETH_Back_Off_Limit***
- ***FunctionalState ETH_MACConfigTypeDef::DeferralCheck***
  Enables or disables the deferral check function in Half Duplex mode.
- ***uint32_t ETH_MACConfigTypeDef::PreambleLength***
  Selects or not the Preamble Length for Transmit packets (Full Duplex mode). This parameter can be a value of ***ETH_Preamble_Length***
- ***FunctionalState ETH_MACConfigTypeDef::UnicastSlowProtocolPacketDetect***
  Enable or disables the Detection of Slow Protocol Packets with unicast address.
- ***FunctionalState ETH_MACConfigTypeDef::SlowProtocolDetect***
  Enable or disables the Slow Protocol Detection.
- ***FunctionalState ETH_MACConfigTypeDef::CRCCheckingRxPackets***
  Enable or disables the CRC Checking for Received Packets.
- ***uint32_t ETH_MACConfigTypeDef::GiantPacketSizeLimit***
  Specifies the packet size that the MAC will declare it as Giant, If it's size is greater than the value programmed in this field in units of bytes This parameter must be a number between Min_Data = 0x618 (1518 byte) and Max_Data = 0x3FFF (32 Kbyte).
- ***FunctionalState ETH_MACConfigTypeDef::ExtendedInterPacketGap***
  Enable or disables the extended inter packet gap.
- ***uint32_t ETH_MACConfigTypeDef::ExtendedInterPacketGapVal***
  Sets the Extended IPG between Packet during transmission. This parameter can be a value from 0x0 to 0xFF
- ***FunctionalState ETH_MACConfigTypeDef::ProgrammableWatchdog***
  Enable or disables the Programmable Watchdog.
- ***uint32_t ETH_MACConfigTypeDef::WatchdogTimeout***
  This field is used as watchdog timeout for a received packet This parameter can be a value of ***ETH_Watchdog_Timeout***
- ***uint32_t ETH_MACConfigTypeDef::PauseTime***
  This field holds the value to be used in the Pause Time field in the transmit control packet. This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xFFFF.
- ***FunctionalState ETH_MACConfigTypeDef::ZeroQuantaPause***
  Enable or disables the automatic generation of Zero Quanta Pause Control packets.
- ***uint32_t ETH_MACConfigTypeDef::PauseLowThreshold***
  This field configures the threshold of the PAUSE to be checked for automatic retransmission of PAUSE Packet. This parameter can be a value of ***ETH_Pause_Low_Threshold***

- ***FunctionalState ETH_MACConfigTypeDef::TransmitFlowControl***
  Enables or disables the MAC to transmit Pause packets in Full Duplex mode or the MAC back pressure operation in Half Duplex mode
- ***FunctionalState ETH_MACConfigTypeDef::UnicastPausePacketDetect***
  Enables or disables the MAC to detect Pause packets with unicast address of the station
- ***FunctionalState ETH_MACConfigTypeDef::ReceiveFlowControl***
  Enables or disables the MAC to decodes the received Pause packet and disables its transmitter for a specified (Pause) time
- ***FunctionalState ETH_MACConfigTypeDef::PacketBurst***
  Enables or disables the MAC to allow packet bursting during transmission in the GMII Halfduplex mode

22.1.8 DMAChannelInstanceTypeDef

DMAChannelInstanceTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***FunctionalState PBLx8Mode***
- ***uint32_t TxDMABurstLength***
- ***FunctionalState SecondPacketOperate***
- ***FunctionalState TCPSegmentation***
- ***uint32_t DescriptorSkipLength***
- ***FunctionalState FlushRxPacket***
- ***uint32_t RxDMABurstLength***
- ***uint32_t MaximumSegmentSize***

Field Documentation

- ***FunctionalState DMAChannelInstanceTypeDef::PBLx8Mode***
  Enables or disables the PBL multiplication by eight.
- ***uint32_t DMAChannelInstanceTypeDef::TxDMABurstLength***
  Indicates the maximum number of beats to be transferred in one Tx DMA transaction. This parameter can be a value of ***ETH_Tx_DMA_Burst_Length***
- ***FunctionalState DMAChannelInstanceTypeDef::SecondPacketOperate***
  Enables or disables the Operate on second Packet mode, which allows the DMA to process a second Packet of Transmit data even before obtaining the status for the first one.
- ***FunctionalState DMAChannelInstanceTypeDef::TCPSegmentation***
  Enables or disables the TCP Segmentation
- ***uint32_t DMAChannelInstanceTypeDef::DescriptorSkipLength***
  Sets the Descriptor Skip Length
- ***FunctionalState DMAChannelInstanceTypeDef::FlushRxPacket***
  Enables or disables the Rx Packet Flush
- ***uint32_t DMAChannelInstanceTypeDef::RxDMABurstLength***
  Indicates the maximum number of beats to be transferred in one Rx DMA transaction. This parameter can be a value of ***ETH_Rx_DMA_Burst_Length***
- ***uint32_t DMAChannelInstanceTypeDef::MaximumSegmentSize***
  Sets the maximum segment size that should be used while segmenting the packet This parameter can be a value from 0x40 to 0x3FFF

22.1.9 ETH_DMAConfigTypeDef

ETH_DMAConfigTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***DMAChannelInstanceTypeDef DMACh***
- ***uint32_t TransmitArbitrationAlgorithm***
- ***FunctionalState AddressAlignedBeats***
- ***uint32_t BurstMode***
- ***uint32_t RxOSRLimit***
- ***uint32_t TxOSRLimit***
- ***uint32_t AXIBLENMaxSize***

- ***FunctionalState TransmitPriority***

Field Documentation

- ***DMAChannelInstanceTypeDef ETH_DMAConfigTypeDef::DMACh[ETH_DMA_CH_CNT]***
  DMA Channel x Configuration
- ***uint32_t ETH_DMAConfigTypeDef::TransmitArbitrationAlgorithm***
  Speicifies the arbitration algorithm for the Transmit side
- ***FunctionalState ETH_DMAConfigTypeDef::AddressAlignedBeats***
  Enables or disables the AHB Master interface address aligned burst transfers on Read and Write channels
- ***uint32_t ETH_DMAConfigTypeDef::BurstMode***
  Sets the AHB Master interface burst transfers. This parameter can be a value of ***ETH_Burst_Mode***
- ***uint32_t ETH_DMAConfigTypeDef::RxOSRLimit***
  Sets the maximum outstanding request on the AXI read interface.
- ***uint32_t ETH_DMAConfigTypeDef::TxOSRLimit***
  Sets the maximum outstanding request on the AXI write interface.
- ***uint32_t ETH_DMAConfigTypeDef::AXIBLENMaxSize***
  Sets the maximum BLEN max size that should be used on th AXI interface to initiate burst transfers of specified lengths
- ***FunctionalState ETH_DMAConfigTypeDef::TransmitPriority***
  Sets Transmit priority over Receive

22.1.10 ETH_InitTypeDef

ETH_InitTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***uint8_t * MACAddr***
- ***ETH_MediaInterfaceTypeDef MediaInterface***
- ***ETH_DMADescTypeDef * TxDesc***
- ***ETH_DMADescTypeDef * RxDesc***
- ***uint32_t RxBuffLen***

Field Documentation

- ***uint8_t* ETH_InitTypeDef::MACAddr***
  MAC Address of used Hardware: must be pointer on an array of 6 bytes
- ***ETH_MediaInterfaceTypeDef ETH_InitTypeDef::MediaInterface***
  Selects the MII/RMII/RGMII interface.
- ***ETH_DMADescTypeDef* ETH_InitTypeDef::TxDesc[ETH_DMA_TX_CH_CNT]***
  Provides the address of the first DMA CH Tx descriptor in the list
- ***ETH_DMADescTypeDef* ETH_InitTypeDef::RxDesc[ETH_DMA_RX_CH_CNT]***
  Provides the address of the first DMA Rx CH descriptor in the list
- ***uint32_t ETH_InitTypeDef::RxBuffLen***
  Provides the length of Rx buffers size

22.1.11 __ETH_HandleTypeDef

__ETH_HandleTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***ETH_TypeDef * Instance***
- ***ETH_InitTypeDef Init***
- ***ETH_TxDescListTypeDef TxDescList***
- ***ETH_RxDescListTypeDef RxDescList***
- ***__IO HAL_ETH_StateTypeDef gState***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t DMAErrorCode***
- ***__IO uint32_t MACErrorCode***
- ***__IO uint32_t MACWakeUpEvent***
- ***__IO uint32_t MACLPIEvent***

- *__IO uint32_t IsPtpConfigured*
- *__IO uint32_t TxCH*
- *__IO uint32_t RxCH*
- *__IO uint32_t TxOpCH*
- *__IO uint32_t RxOpCH*
- *void(* TxCpltCallback*
- *void(* RxCpltCallback*
- *void(* ErrorCallback*
- *void(* PMTCallback*
- *void(* EEECallback*
- *void(* WakeUpCallback*
- *void(* MspInitCallback*
- *void(* MspDeInitCallback*
- *pETH_rxAllocateCallbackTypeDef rxAllocateCallback*
- *pETH_rxLinkCallbackTypeDef rxLinkCallback*
- *pETH_txFreeCallbackTypeDef txFreeCallback*
- *pETH_txPtpCallbackTypeDef txPtpCallback*

Field Documentation

- ***ETH_TypeDef* __ETH_HandleTypeDef::Instance***
  Register base address
- ***ETH_InitTypeDef __ETH_HandleTypeDef::Init***
  Ethernet Init Configuration
- ***ETH_TxDescListTypeDef __ETH_HandleTypeDef::TxDescList[ETH_DMA_TX_CH_CNT]***
  DMA Channel Tx descriptor wrapper: holds all Tx descriptors list addresses and current descriptor index
- ***ETH_RxDescListTypeDef __ETH_HandleTypeDef::RxDescList[ETH_DMA_RX_CH_CNT]***
  DMA Channel Rx descriptor wrapper: holds all Rx descriptors list addresses and current descriptor index
- ***__IO HAL_ETH_StateTypeDef __ETH_HandleTypeDef::gState***
  ETH state information related to global Handle management and also related to Tx operations. This parameter can be a value of ***ETH_State_Codes***
- ***__IO uint32_t __ETH_HandleTypeDef::ErrorCode***
  Holds the global Error code of the ETH HAL status machine This parameter can be a value of ***ETH_Error_Code***.
- ***__IO uint32_t __ETH_HandleTypeDef::DMAErrorCode***
  Holds the DMA CH0/CH1 Rx Tx Error code when a DMA AIS interrupt occurs This parameter can be a combination of ***ETH_DMA_Status_Flags***
- ***__IO uint32_t __ETH_HandleTypeDef::MACErrorCode***
  Holds the MAC Rx Tx Error code when a MAC Rx or Tx status interrupt occurs This parameter can be a combination of ***ETH_MAC_Rx_Tx_Status***
- ***__IO uint32_t __ETH_HandleTypeDef::MACWakeUpEvent***
  Holds the Wake Up event when the MAC exit the power down mode This parameter can be a value of ***ETH_MAC_Wake_Up_Event***
- ***__IO uint32_t __ETH_HandleTypeDef::MACLPIEvent***
  Holds the LPI event when the an LPI status interrupt occurs. This parameter can be a value of ***ETHEx_LPI_Event***
- ***__IO uint32_t __ETH_HandleTypeDef::IsPtpConfigured***
  Holds the PTP configuration status. This parameter can be a value of ***ETH_PTP_Config_Status***
- ***__IO uint32_t __ETH_HandleTypeDef::TxCH***
  Holds the Tx DMA Channels Number events. This parameter can be a value of ***ETH_DMA_Channel_Number_Tx_Rx_Selection***
- ***__IO uint32_t __ETH_HandleTypeDef::RxCH***
  Holds the Rx DMA Channels Number events. This parameter can be a value of ***ETH_DMA_Channel_Number_Tx_Rx_Selection***

- ***__IO uint32_t __ETH_HandleTypeDef::TxOpCH***
  Holds the Tx DMA Channel Index which transfer data. This parameter can be a value of ***ETH_DMA_Channel_Number_TxOp_RxOp_Selection***
- ***__IO uint32_t __ETH_HandleTypeDef::RxOpCH***
  Holds the Rx DMA Channel Index which receive data. This parameter can be a value of ***ETH_DMA_Channel_Number_TxOp_RxOp_Selection***
- ***void(* __ETH_HandleTypeDef::TxCpltCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Tx Complete Callback
- ***void(* __ETH_HandleTypeDef::RxCpltCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Rx Complete Callback
- ***void(* __ETH_HandleTypeDef::ErrorCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Error Callback
- ***void(* __ETH_HandleTypeDef::PMTCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Power Management Callback
- ***void(* __ETH_HandleTypeDef::EEECallback)(struct __ETH_HandleTypeDef *heth)***
  ETH EEE Callback
- ***void(* __ETH_HandleTypeDef::WakeUpCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Wake UP Callback
- ***void(* __ETH_HandleTypeDef::MspInitCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Msp Init callback
- ***void(* __ETH_HandleTypeDef::MspDeInitCallback)(struct __ETH_HandleTypeDef *heth)***
  ETH Msp DeInit callback
- ***pETH_rxAllocateCallbackTypeDef __ETH_HandleTypeDef::rxAllocateCallback***
  ETH Rx Get Buffer Function
- ***pETH_rxLinkCallbackTypeDef __ETH_HandleTypeDef::rxLinkCallback***
  ETH Rx Set App Data Function
- ***pETH_txFreeCallbackTypeDef __ETH_HandleTypeDef::txFreeCallback***
  ETH Tx Free Function
- ***pETH_txPtpCallbackTypeDef __ETH_HandleTypeDef::txPtpCallback***
  ETH Tx Handle Ptp Function

22.1.12 ETH_MACFilterConfigTypeDef

ETH_MACFilterConfigTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***FunctionalState PromiscuousMode***
- ***FunctionalState ReceiveAllMode***
- ***FunctionalState HachOrPerfectFilter***
- ***FunctionalState HashUnicast***
- ***FunctionalState HashMulticast***
- ***FunctionalState PassAllMulticast***
- ***FunctionalState SrcAddrFiltering***
- ***FunctionalState SrcAddrInverseFiltering***
- ***FunctionalState DestAddrInverseFiltering***
- ***FunctionalState BroadcastFilter***
- ***uint32_t ControlPacketsFilter***

Field Documentation

- ***FunctionalState ETH_MACFilterConfigTypeDef::PromiscuousMode***
  Enable or Disable Promiscuous Mode
- ***FunctionalState ETH_MACFilterConfigTypeDef::ReceiveAllMode***
  Enable or Disable Receive All Mode
- ***FunctionalState ETH_MACFilterConfigTypeDef::HachOrPerfectFilter***
  Enable or Disable Perfect filtering in addition to Hash filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::HashUnicast***
  Enable or Disable Hash filtering on unicast packets

- ***FunctionalState ETH_MACFilterConfigTypeDef::HashMulticast***
  Enable or Disable Hash filtering on multicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::PassAllMulticast***
  Enable or Disable passing all multicast packets
- ***FunctionalState ETH_MACFilterConfigTypeDef::SrcAddrFiltering***
  Enable or Disable source address filtering module
- ***FunctionalState ETH_MACFilterConfigTypeDef::SrcAddrInverseFiltering***
  Enable or Disable source address inverse filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::DestAddrInverseFiltering***
  Enable or Disable destination address inverse filtering
- ***FunctionalState ETH_MACFilterConfigTypeDef::BroadcastFilter***
  Enable or Disable broadcast filter
- ***uint32_t ETH_MACFilterConfigTypeDef::ControlPacketsFilter***
  Set the control packets filter This parameter can be a value of ***ETH_Control_Packets_Filter***

22.1.13 ETH_PowerDownConfigTypeDef

ETH_PowerDownConfigTypeDef is defined in the stm32n6xx_hal_eth.h

Data Fields

- ***FunctionalState WakeUpPacket***
- ***FunctionalState MagicPacket***
- ***FunctionalState GlobalUnicast***
- ***FunctionalState WakeUpForward***

Field Documentation

- ***FunctionalState ETH_PowerDownConfigTypeDef::WakeUpPacket***
  Enable or Disable Wake up packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::MagicPacket***
  Enable or Disable Magic packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::GlobalUnicast***
  Enable or Disable Global unicast packet detection in power down mode
- ***FunctionalState ETH_PowerDownConfigTypeDef::WakeUpForward***
  Enable or Disable Forwarding Wake up packets

22.2 ETH Firmware driver API description

The following section lists the various functions of the ETH library.

22.2.1 How to use this driver

The ETH HAL driver can be used as follows:

1. Declare a ETH_HandleTypeDef handle structure, for example: ETH_HandleTypeDef heth;
2. Fill parameters of Init structure in heth handle
3. Call HAL_ETH_Init() API to initialize the Ethernet peripheral (MAC, DMA, ...)
4. Initialize the ETH low level resources through the HAL_ETH_MspInit() API:
   a. Enable the Ethernet interface clock using
      - __HAL_RCC_ETH1MAC_CLK_ENABLE()
      - __HAL_RCC_ETH1TX_CLK_ENABLE()
      - __HAL_RCC_ETH1RX_CLK_ENABLE()
   b. Initialize the related GPIO clocks
   c. Configure Ethernet pinout
   d. Configure Ethernet NVIC interrupt (in Interrupt mode)

5. Ethernet data reception is asynchronous, so call the following API to start the listening mode:
   a. HAL_ETH_Start(): This API starts the MAC and DMA transmission and reception process, without enabling end of transfer interrupts, in this mode user has to poll for data reception by calling HAL_ETH_ReadData()
   b. HAL_ETH_Start_IT(): This API starts the MAC and DMA transmission and reception process, end of transfer interrupts are enabled in this mode, HAL_ETH_RxCpltCallback() will be executed when an Ethernet packet is received
6. When data is received user can call the following API to get received data:
   a. HAL_ETH_ReadData(): Read a received packet
7. For transmission path, two APIs are available:
   a. HAL_ETH_Transmit(): Transmit an ETH frame in blocking mode
   b. HAL_ETH_Transmit_IT(): Transmit an ETH frame in interrupt mode, HAL_ETH_TxCpltCallback() will be executed when end of transfer occur
8. Communication with an external PHY device:
   a. HAL_ETH_ReadPHYRegister(): Read a register from an external PHY
   b. HAL_ETH_WritePHYRegister(): Write data to an external RHY register
9. Configure the Ethernet MAC after ETH peripheral initialization
   a. HAL_ETH_GetMACConfig(): Get MAC actual configuration into ETH_MACConfigTypeDef
   b. HAL_ETH_SetMACConfig(): Set MAC configuration based on ETH_MACConfigTypeDef
10. Configure the Ethernet DMA after ETH peripheral initialization
    a. HAL_ETH_GetDMAConfig(): Get DMA actual configuration into ETH_DMAConfigTypeDef
    b. HAL_ETH_SetDMAConfig(): Set DMA configuration based on ETH_DMAConfigTypeDef
11. Configure the Ethernet PTP after ETH peripheral initialization
    a. Define HAL_ETH_USE_PTP to use PTP APIs.
    b. HAL_ETH_PTP_GetConfig(): Get PTP actual configuration into ETH_PTP_ConfigTypeDef
    c. HAL_ETH_PTP_SetConfig(): Set PTP configuration based on ETH_PTP_ConfigTypeDef
    d. HAL_ETH_PTP_GetTime(): Get Seconds and Nanoseconds for the Ethernet PTP registers
    e. HAL_ETH_PTP_SetTime(): Set Seconds and Nanoseconds for the Ethernet PTP registers
    f. HAL_ETH_PTP_AddTimeOffset(): Add Seconds and Nanoseconds offset for the Ethernet PTP registers
    g. HAL_ETH_PTP_AddendUpdate(): Update the Addend register
    h. HAL_ETH_PTP_InsertTxTimestamp(): Insert Timestamp in transmission
    i. HAL_ETH_PTP_GetTxTimestamp(): Get transmission timestamp
    j. HAL_ETH_PTP_GetRxTimestamp(): Get reception timestamp -@- The ARP offload feature is not supported in this driver. -@- The PTP offload feature is not supported in this driver.

Callback registration

22.2.2 Detailed description of functions

HAL_ETH_Init

Function name

HAL_StatusTypeDef HAL_ETH_Init (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_DeInit

Function name

HAL_StatusTypeDef HAL_ETH_DeInit (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_MspInit

Function name

void HAL_ETH_MspInit (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_MspDeInit

Function name

void HAL_ETH_MspDeInit (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_RegisterCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterCallback (ETH_HandleTypeDef * heth, HAL_ETH_CallbackIDTypeDef CallbackID, pETH_CallbackTypeDef pCallback)

Function description

HAL_ETH_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterCallback (ETH_HandleTypeDef * heth, HAL_ETH_CallbackIDTypeDef CallbackID)

Function description

HAL_ETH_Start

Function name

HAL_StatusTypeDef HAL_ETH_Start (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_Start_IT

Function name

HAL_StatusTypeDef HAL_ETH_Start_IT (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_Stop

Function name

HAL_StatusTypeDef HAL_ETH_Stop (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_Stop_IT

Function name

HAL_StatusTypeDef HAL_ETH_Stop_IT (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_ReadData

Function name

HAL_StatusTypeDef HAL_ETH_ReadData (ETH_HandleTypeDef * heth, void ** pAppBuff)

Function description

HAL_ETH_RegisterRxAllocateCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterRxAllocateCallback (ETH_HandleTypeDef * heth, pETH_rxAllocateCallbackTypeDef rxAllocateCallback)

Function description

HAL_ETH_UnRegisterRxAllocateCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterRxAllocateCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_RegisterRxLinkCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterRxLinkCallback (ETH_HandleTypeDef * heth, pETH_rxLinkCallbackTypeDef rxLinkCallback)

Function description

HAL_ETH_UnRegisterRxLinkCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterRxLinkCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_GetRxDataErrorCode

Function name

HAL_StatusTypeDef HAL_ETH_GetRxDataErrorCode (const ETH_HandleTypeDef * heth, uint32_t * pErrorCode)

Function description

HAL_ETH_RegisterTxFreeCallback

Function name

HAL_StatusTypeDef HAL_ETH_RegisterTxFreeCallback (ETH_HandleTypeDef * heth, pETH_txFreeCallbackTypeDef txFreeCallback)

Function description

HAL_ETH_UnRegisterTxFreeCallback

Function name

HAL_StatusTypeDef HAL_ETH_UnRegisterTxFreeCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_ReleaseTxPacket

Function name

HAL_StatusTypeDef HAL_ETH_ReleaseTxPacket (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_Transmit

Function name

HAL_StatusTypeDef HAL_ETH_Transmit (ETH_HandleTypeDef * heth, ETH_TxPacketConfigTypeDef * pTxConfig, uint32_t Timeout)

Function description

HAL_ETH_Transmit_IT

Function name

HAL_StatusTypeDef HAL_ETH_Transmit_IT (ETH_HandleTypeDef * heth, ETH_TxPacketConfigTypeDef * pTxConfig)

Function description

HAL_ETH_WritePHYRegister

Function name

HAL_StatusTypeDef HAL_ETH_WritePHYRegister (const ETH_HandleTypeDef * heth, uint32_t PHYAddr, uint32_t PHYReg, uint32_t RegValue)

Function description

HAL_ETH_ReadPHYRegister

Function name

HAL_StatusTypeDef HAL_ETH_ReadPHYRegister (ETH_HandleTypeDef * heth, uint32_t PHYAddr, uint32_t PHYReg, uint32_t * pRegValue)

Function description

HAL_ETH_IRQHandler

Function name

void HAL_ETH_IRQHandler (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_TxCpltCallback

Function name

void HAL_ETH_TxCpltCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_RxCpltCallback

Function name

void HAL_ETH_RxCpltCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_ErrorCallback

Function name

void HAL_ETH_ErrorCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_PMTCallback

Function name

void HAL_ETH_PMTCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_EEECallback

Function name

void HAL_ETH_EEECallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_WakeUpCallback

Function name

void HAL_ETH_WakeUpCallback (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_RxAllocateCallback

Function name

void HAL_ETH_RxAllocateCallback (uint8_t ** buff)

Function description

HAL_ETH_RxLinkCallback

Function name

void HAL_ETH_RxLinkCallback (void ** pStart, void ** pEnd, uint8_t * buff, uint16_t Length)

Function description

HAL_ETH_TxFreeCallback

Function name

void HAL_ETH_TxFreeCallback (uint32_t * buff)

Function description

HAL_ETH_TxPtpCallback

Function name

void HAL_ETH_TxPtpCallback (uint32_t * buff, ETH_TimeStampTypeDef * timestamp)

Function description

HAL_ETH_GetMACConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetMACConfig (const ETH_HandleTypeDef * heth, ETH_MACConfigTypeDef * macconf)

Function description

HAL_ETH_GetDMAConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetDMAConfig (const ETH_HandleTypeDef * heth, ETH_DMAConfigTypeDef * dmaconf)

Function description

HAL_ETH_SetMACConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetMACConfig (ETH_HandleTypeDef * heth, ETH_MACConfigTypeDef * macconf)

Function description

HAL_ETH_SetDMAConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetDMAConfig (ETH_HandleTypeDef * heth, ETH_DMAConfigTypeDef * dmaconf)

Function description

HAL_ETH_SetMDIOClockRange

Function name

void HAL_ETH_SetMDIOClockRange (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_SetRxVLANIdentifier

Function name

void HAL_ETH_SetRxVLANIdentifier (ETH_HandleTypeDef * heth, uint32_t ComparisonBits, uint32_t VLANIdentifier)

Function description

HAL_ETH_GetMACFilterConfig

Function name

HAL_StatusTypeDef HAL_ETH_GetMACFilterConfig (const ETH_HandleTypeDef * heth, ETH_MACFilterConfigTypeDef * pFilterConfig)

Function description

HAL_ETH_SetMACFilterConfig

Function name

HAL_StatusTypeDef HAL_ETH_SetMACFilterConfig (ETH_HandleTypeDef * heth, const ETH_MACFilterConfigTypeDef * pFilterConfig)

Function description

HAL_ETH_SetHashTable

Function name

HAL_StatusTypeDef HAL_ETH_SetHashTable (ETH_HandleTypeDef * heth, uint32_t * pHashTable)

Function description

HAL_ETH_SetSourceMACAddrMatch

Function name

HAL_StatusTypeDef HAL_ETH_SetSourceMACAddrMatch (const ETH_HandleTypeDef * heth, uint32_t AddrNbr, const uint8_t * pMACAddr)

Function description

HAL_ETH_EnterPowerDownMode

Function name

void HAL_ETH_EnterPowerDownMode (ETH_HandleTypeDef * heth, const ETH_PowerDownConfigTypeDef * pPowerDownConfig)

Function description

HAL_ETH_ExitPowerDownMode

Function name

void HAL_ETH_ExitPowerDownMode (ETH_HandleTypeDef * heth)

Function description

HAL_ETH_SetWakeUpFilter

Function name

HAL_StatusTypeDef HAL_ETH_SetWakeUpFilter (ETH_HandleTypeDef * heth, uint32_t * pFilter, uint32_t Count)

Function description

HAL_ETH_GetState

Function name

HAL_ETH_StateTypeDef HAL_ETH_GetState (const ETH_HandleTypeDef * heth)

Function description

HAL_ETH_GetError

Function name

uint32_t HAL_ETH_GetError (const ETH_HandleTypeDef * heth)

Function description

HAL_ETH_GetDMAError

Function name

uint32_t HAL_ETH_GetDMAError (const ETH_HandleTypeDef * heth)

Function description

HAL_ETH_GetMACError

Function name

uint32_t HAL_ETH_GetMACError (const ETH_HandleTypeDef * heth)

Function description

HAL_ETH_GetMACWakeUpSource

Function name

uint32_t HAL_ETH_GetMACWakeUpSource (const ETH_HandleTypeDef * heth)

Function description

HAL_ETH_GetTxBuffersNumber

Function name

uint32_t HAL_ETH_GetTxBuffersNumber (const ETH_HandleTypeDef * heth)

Function description

ETH Exported Macros

__HAL_ETH_RESET_HANDLE_STATE

Description:

- Reset ETH handle state.

Parameters:

- __HANDLE__: specifies the ETH handle.

Return value:

- None

__HAL_ETH_DMA_CH_ENABLE_IT

Description:

- Enables the specified ETHERNET DMA interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __CH__: : DMA Channel
- __INTERRUPT__: specifies the ETHERNET DMA interrupt sources to be enabled

Return value:

- None

__HAL_ETH_DMA_CH_DISABLE_IT

Description:

- Disables the specified ETHERNET DMA interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __CH__: : DMA Channel
- __INTERRUPT__: specifies the ETHERNET DMA interrupt sources to be disabled.

Return value:

- None

__HAL_ETH_DMA_CH_GET_IT_SOURCE

Description:

- Gets the ETHERNET DMA IT source enabled or disabled.

Parameters:

- __HANDLE__: : ETH Handle
- __CH__: : DMA Channel
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: ETH DMA IT Source enabled or disabled

__HAL_ETH_DMA_CH_GET_IT

Description:

- Gets the ETHERNET DMA IT pending bit.

Parameters:

- __HANDLE__: : ETH Handle
- __CH__: : DMA Channel
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: state of ETH DMA IT (SET or RESET)

__HAL_ETH_DMA_CH_CLEAR_IT

Description:

- Clears the ETHERNET DMA IT pending bit.

Parameters:

- __HANDLE__: : ETH Handle
- __CH__: : DMA Channel
- __INTERRUPT__: specifies the interrupt pending bit to clear.

Return value:

- None

__HAL_ETH_DMA_GET_FLAG

Description:

- Checks whether the specified ETHERNET DMA flag is set or not.

Parameters:

- __HANDLE__: ETH Handle
- __CH__: : DMA Channel
- __FLAG__: specifies the flag to check.

Return value:

- The: state of ETH DMA FLAG (SET or RESET).

__HAL_ETH_DMA_CLEAR_FLAG

Description:

- Clears the specified ETHERNET DMA flag.

Parameters:

- __HANDLE__: ETH Handle
- __CH__: : DMA Channel
- __FLAG__: specifies the flag to check.

Return value:

- The: state of ETH DMA FLAG (SET or RESET).

__HAL_ETH_MTL_Q_ENABLE_IT

Description:

- Enables the specified ETHERNET MTL interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __Q__: : MTL Queue
- __INTERRUPT__: specifies the ETHERNET MTL interrupt sources to be enabled

Return value:

- None

__HAL_ETH_MTL_GET_IT

Description:

- Gets the ETHERNET MTL IT source enabled or disabled.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: ETH MTL IT Source enabled or disabled

__HAL_ETH_MTL_Q_GET_IT_SOURCE

Description:

- Gets the ETHERNET MTL IT pending bit.

Parameters:

- __HANDLE__: : ETH Handle
- __Q__: : MTL Queue
- __INTERRUPT__: specifies the interrupt source to get .

Return value:

- The: state of ETH MTL IT (SET or RESET)

__HAL_ETH_MTL_Q_DISABLE_IT

Description:

- Disables the specified ETHERNET MTL interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __Q__: : MTL Queue
- __INTERRUPT__: specifies the ETHERNET MTL interrupt sources to be disabled

Return value:

- None

__HAL_ETH_MAC_ENABLE_IT

Description:

- Enables the specified ETHERNET MAC interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET MAC interrupt sources to be enabled

Return value:

- None

__HAL_ETH_MAC_DISABLE_IT

Description:

- Disables the specified ETHERNET MAC interrupts.

Parameters:

- __HANDLE__: : ETH Handle
- __INTERRUPT__: specifies the ETHERNET MAC interrupt sources to be enabled

Return value:

- None

__HAL_ETH_MAC_GET_IT

Description:

- Checks whether the specified ETHERNET MAC flag is set or not.

Parameters:

- __HANDLE__: ETH Handle
- __INTERRUPT__: specifies the flag to check.

Return value:

- The: state of ETH MAC IT (SET or RESET). External interrupt line 51 Connected to the ETH wakeup EXTI Line

ETH_WAKEUP_EXTI_LINE

__HAL_ETH_WAKEUP_EXTI_ENABLE_IT

Description:

- Enable the ETH WAKEUP Exti Line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be enabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTI_GET_FLAG

Description:

- checks whether the specified ETH WAKEUP Exti interrupt flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- EXTI: ETH WAKEUP Line Status.

__HAL_ETH_WAKEUP_EXTI_CLEAR_FLAG

Description:

- Clear the ETH WAKEUP Exti flag.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP Exti sources to be cleared.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_ETH_WAKEUP_EXTI_ENABLE_RISING_EDGE

Description:

- enable rising edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_ENABLE_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_ETH_WAKEUP_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the ETH WAKEUP EXTI sources to be disabled.
  - ETH_WAKEUP_EXTI_LINE

Return value:

- None

Field Documentation

- ***FunctionalState ETH_RxVLANConfigTypeDef::InnerVLANTagInStatus***
  Enables or disables Inner VLAN Tag in Rx Status
- ***uint32_t ETH_RxVLANConfigTypeDef::StripInnerVLANTag***
  Sets the Inner VLAN Tag Stripping on Receive This parameter can be a value of ***ETHEx_Rx_Inner_VLAN_Tag_Stripping***
- ***FunctionalState ETH_RxVLANConfigTypeDef::InnerVLANTag***
  Enables or disables Inner VLAN Tag
- ***FunctionalState ETH_RxVLANConfigTypeDef::DoubleVLANProcessing***
  Enable or Disable double VLAN processing
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagHashTableMatch***
  Enable or Disable VLAN Tag Hash Table Match
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagInStatus***
  Enable or Disable VLAN Tag in Rx status
- ***uint32_t ETH_RxVLANConfigTypeDef::StripVLANTag***
  Set the VLAN Tag Stripping on Receive This parameter can be a value of ***ETHEx_Rx_VLAN_Tag_Stripping***
- ***uint32_t ETH_RxVLANConfigTypeDef::VLANTypeCheck***
  Enable or Disable VLAN Type Check This parameter can be a value of ***ETHEx_VLAN_Type_Check***
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagInverseMatch***
  Enable or disable VLAN Tag Inverse Match
- ***FunctionalState ETH_RxVLANConfigTypeDef::BitVLANcomparison***
  Enable 12-Bit VLAN Tag Comparison
- ***uint32_t ETH_RxVLANConfigTypeDef::VLANcomparison***
  12-bit or 16-bit VLAN comparison
- ***FunctionalState ETH_RxVLANConfigTypeDef::VLANTagEnable***
  VLAN Tag Enable
- ***uint32_t ETH_RxVLANConfigTypeDef::VLANTagID***
  VLAN Tag ID

- ***uint32_t ETH_RxVLANConfigTypeDef::RxDMAChannelNumber***
  Rx DMA Channel Number
- ***FunctionalState ETH_RxVLANConfigTypeDef::DMAChannelNumberEnable***
  Enable Rx DMA Channel Number

23.1.2 ETH_MACMTLMappingTypeDef

ETH_MACMTLMappingTypeDef is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***uint32_t VLANTagFilterFailPacketsQueue***
- ***FunctionalState VLANTagFilterFailPacketsQueuingEnable***
- ***uint32_t MulticastAddFilterFailPacketsQueue***
- ***FunctionalState MulticastAddrFilterFailPacketsQueuingEnable***
- ***uint32_t UnicastAddrFilterFailPacketsQueue***
- ***FunctionalState UnicastAddrFilterFailPacketsQueuingEnable***
- ***FunctionalState TypeFieldBasedRxQueuingEnable***
- ***uint32_t OverridingMCBCQueuePrioritySelect***
- ***uint32_t FramePreemptionResidueQueue***
- ***uint32_t TaggedPTPoEPacketsQueuingControl***
- ***FunctionalState TaggedAVControlPacketsQueuingEnable***
- ***FunctionalState MulticastBroadcastQueueEnable***
- ***uint32_t MulticastBroadcastQueue***
- ***uint32_t UntaggedPacketQueue***
- ***uint32_t PTPPacketsQueue***
- ***uint32_t AVUntaggedControlPacketsQueue***
- ***uint32_t PrioritiesSelectedRxQ0***
- ***uint32_t PrioritiesSelectedRxQ1***

Field Documentation

- ***uint32_t ETH_MACMTLMappingTypeDef::VLANTagFilterFailPacketsQueue***
  Specifies the Rx queue to which the tagged packets fail DA/SA/VLANtag filter must be routed to
- ***FunctionalState ETH_MACMTLMappingTypeDef::VLANTagFilterFailPacketsQueuingEnable***
  Enables routing the tagged packets fail DA/SA/VLANtag filter to Rx queue
- ***uint32_t ETH_MACMTLMappingTypeDef::MulticastAddFilterFailPacketsQueue***
  Specifies the Rx queue to which the Multicast packets fail the DA/SA filter are routed to
- ***FunctionalState ETH_MACMTLMappingTypeDef::MulticastAddrFilterFailPacketsQueuingEnable***
  Enables routing Multicast Packets fail DA/SA filter to Rx Queue programmed in MFFQ
- ***uint32_t ETH_MACMTLMappingTypeDef::UnicastAddrFilterFailPacketsQueue***
  Specifies the Rx queue to which the Unicast packets fail the DA/SA filter are routed to
- ***FunctionalState ETH_MACMTLMappingTypeDef::UnicastAddrFilterFailPacketsQueuingEnable***
  Enables routing Unicast Packets fail DA/SA filter to Rx Queue programmed in UFFQ
- ***FunctionalState ETH_MACMTLMappingTypeDef::TypeFieldBasedRxQueuingEnable***
  Enables Type field based Rx queuing
- ***uint32_t ETH_MACMTLMappingTypeDef::OverridingMCBCQueuePrioritySelect***
  Select the Overriding MC-BC queue priority
- ***uint32_t ETH_MACMTLMappingTypeDef::FramePreemptionResidueQueue***
  Specifies the Rx queue to which the residual preemption frames must be forwarded
- ***uint32_t ETH_MACMTLMappingTypeDef::TaggedPTPoEPacketsQueuingControl***
  Specifies the routing of the VLAN tagged PTPoE packets
- ***FunctionalState ETH_MACMTLMappingTypeDef::TaggedAVControlPacketsQueuingEnable***
  Enable MAC routes the received Tagged AV control packets to Rx queue specified by AVCPQ field
- ***FunctionalState ETH_MACMTLMappingTypeDef::MulticastBroadcastQueueEnable***
  Specifies that Multicast or Broadcast packets routing to the Rx queue is enabled
- ***uint32_t ETH_MACMTLMappingTypeDef::MulticastBroadcastQueue***
  Specifies the Rx queue onto which Multicast or Broadcast packets are routed

- ***uint32_t ETH_MACMTLMappingTypeDef::UntaggedPacketQueue***
  Specifies the Rx queue to which Untagged Packets are to be routed
- ***uint32_t ETH_MACMTLMappingTypeDef::PTPPacketsQueue***
  Specifies the Rx queue on which the PTP packets sent over the Ethernet payload
- ***uint32_t ETH_MACMTLMappingTypeDef::AVUntaggedControlPacketsQueue***
  Specifies the Receive queue to receive AV untagged control packets
- ***uint32_t ETH_MACMTLMappingTypeDef::PrioritiesSelectedRxQ0***
  Specifies the Priorities Selected in the Receive Queue 0 ***ETHEx_Rx_VLAN_PRIO***
- ***uint32_t ETH_MACMTLMappingTypeDef::PrioritiesSelectedRxQ1***
  Specifies the Priorities Selected in the Receive Queue 1 ***ETHEx_Rx_VLAN_PRIO***

23.1.3 MTL_TxQueueInstance_t

MTL_TxQueueInstance_t is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***uint32_t QueueOpMode***
- ***uint32_t AVAlgorithm***
- ***uint32_t TxQueueSize***
- ***uint32_t TransmitQueueMode***

Field Documentation

- ***uint32_t MTL_TxQueueInstance_t::QueueOpMode***
  Queue Disabled, Enabled or AV Mode.
- ***uint32_t MTL_TxQueueInstance_t::AVAlgorithm***
  Queue Disabled, Enabled or AV Mode.
- ***uint32_t MTL_TxQueueInstance_t::TxQueueSize***
  Specifies the Tx Queue Size
- ***uint32_t MTL_TxQueueInstance_t::TransmitQueueMode***
  Specifies the Transmit Queue operating mode.

23.1.4 MTL_RxQueueInstance_t

MTL_RxQueueInstance_t is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***uint32_t QueueOpMode***
- ***uint32_t RxQueueSize***
- ***FunctionalState DropTCPIPChecksumErrorPacket***
- ***FunctionalState ForwardRxErrorPacket***
- ***FunctionalState ForwardRxUndersizedGoodPacket***
- ***uint32_t ReceiveQueueMode***
- ***uint32_t MappedToDMACh***

Field Documentation

- ***uint32_t MTL_RxQueueInstance_t::QueueOpMode***
  Queue Disabled, Enabled or AV Mode.
- ***uint32_t MTL_RxQueueInstance_t::RxQueueSize***
  Specifies the Rx Queue Size
- ***FunctionalState MTL_RxQueueInstance_t::DropTCPIPChecksumErrorPacket***
  Enables or disables Dropping of TCPIP Checksum Error Packets.
- ***FunctionalState MTL_RxQueueInstance_t::ForwardRxErrorPacket***
  Enables or disables forwarding Error Packets.
- ***FunctionalState MTL_RxQueueInstance_t::ForwardRxUndersizedGoodPacket***
  Enables or disables forwarding Undersized Good Packets.
- ***uint32_t MTL_RxQueueInstance_t::ReceiveQueueMode***
  Specifies the Receive Queue operating mode
- ***uint32_t MTL_RxQueueInstance_t::MappedToDMACh***
  Specifies the DMA Channel to which MTL Q is mapped

23.1.5 ETH_MTLConfigTypeDef

ETH_MTLConfigTypeDef is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***uint32_t TxSchedulingAlgorithm***
- ***uint32_t ReceiveArbitrationAlgorithm***
- ***MTL_TxQueueInstance_t TxQ***
- ***MTL_RxQueueInstance_t RxQ***
- ***FunctionalState TransmitStatus***

Field Documentation

- ***uint32_t ETH_MTLConfigTypeDef::TxSchedulingAlgorithm***
  Specifies the algorithm for Tx scheduling
- ***uint32_t ETH_MTLConfigTypeDef::ReceiveArbitrationAlgorithm***
  Specifies the arbitration algorithm for the Rx side
- ***MTL_TxQueueInstance_t ETH_MTLConfigTypeDef::TxQ[ETH_MTL_TX_Q_CNT]***
  MTL Tx Queue Configuration
- ***MTL_RxQueueInstance_t ETH_MTLConfigTypeDef::RxQ[ETH_MTL_RX_Q_CNT]***
  MTL Rx Queue Configuration
- ***FunctionalState ETH_MTLConfigTypeDef::TransmitStatus***
  Enables or disables forwarding Tx Packet Status to the application.

23.1.6 ETH_PacketTypeQueueConfigTypeDef

ETH_PacketTypeQueueConfigTypeDef is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***ETH_IDRegTypeDef Address***
- ***uint32_t Type***
- ***uint32_t Queue***
- ***uint32_t Preemption***

Field Documentation

- ***ETH_IDRegTypeDef ETH_PacketTypeQueueConfigTypeDef::Address***
  Sets Address Offset for indirect accesses to ETH_MAC_TMRQR
- ***uint32_t ETH_PacketTypeQueueConfigTypeDef::Type***
  Indicates the type value of packet that needs to be compared with the received packet.
- ***uint32_t ETH_PacketTypeQueueConfigTypeDef::Queue***
  Indicates the receive queue number to which the packet needs to be forwarded
- ***uint32_t ETH_PacketTypeQueueConfigTypeDef::Preemption***
  Preemption or Express Packet This parameter can be a value of ***ETHEx_Preemption_Packet***

23.1.7 ETH_TxVLANConfigTypeDef

ETH_TxVLANConfigTypeDef is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***FunctionalState SourceTxDesc***
- ***FunctionalState SVLANType***
- ***uint32_t VLANTagControl***

Field Documentation

- ***FunctionalState ETH_TxVLANConfigTypeDef::SourceTxDesc***
  Enable or Disable VLAN tag source from DMA tx descriptors
- ***FunctionalState ETH_TxVLANConfigTypeDef::SVLANType***
  Enable or Disable insertion of SVLAN type
- ***uint32_t ETH_TxVLANConfigTypeDef::VLANTagControl***
  Sets the VLAN tag control in tx packets This parameter can be a value of ***ETHEx_VLAN_Tag_Control***

23.1.8 ETH_L3FilterConfigTypeDef

ETH_L3FilterConfigTypeDef is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***uint32_t Protocol***
- ***uint32_t SrcAddrFilterMatch***
- ***uint32_t DestAddrFilterMatch***
- ***uint32_t SrcAddrHigherBitsMatch***
- ***uint32_t DestAddrHigherBitsMatch***
- ***uint32_t Ip4SrcAddr***
- ***uint32_t Ip4DestAddr***
- ***uint32_t Ip6Addr***

Field Documentation

- ***uint32_t ETH_L3FilterConfigTypeDef::Protocol***
  Sets the L3 filter protocol to IPv4 or IPv6 This parameter can be a value of ***ETHEx_L3_Protocol***
- ***uint32_t ETH_L3FilterConfigTypeDef::SrcAddrFilterMatch***
  Sets the L3 filter source address match This parameter can be a value of ***ETHEx_L3_Source_Match***
- ***uint32_t ETH_L3FilterConfigTypeDef::DestAddrFilterMatch***
  Sets the L3 filter destination address match This parameter can be a value of ***ETHEx_L3_Destination_Match***
- ***uint32_t ETH_L3FilterConfigTypeDef::SrcAddrHigherBitsMatch***
  Sets the L3 filter source address higher bits match This parameter can be a value from 0 to 31
- ***uint32_t ETH_L3FilterConfigTypeDef::DestAddrHigherBitsMatch***
  Sets the L3 filter destination address higher bits match This parameter can be a value from 0 to 31
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip4SrcAddr***
  Sets the L3 filter IPv4 source address if IPv4 protocol is used This parameter can be a value from 0x0 to 0xFFFFFFFF
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip4DestAddr***
  Sets the L3 filter IPv4 destination address if IPv4 protocol is used This parameter can be a value from 0 to 0xFFFFFFFF
- ***uint32_t ETH_L3FilterConfigTypeDef::Ip6Addr[4]***
  Sets the L3 filter IPv6 address if IPv6 protocol is used This parameter must be a table of 4 words (4* 32 bits)

23.1.9 ETH_L4FilterConfigTypeDef

ETH_L4FilterConfigTypeDef is defined in the stm32n6xx_hal_eth_ex.h

Data Fields

- ***uint32_t Protocol***
- ***uint32_t SrcPortFilterMatch***
- ***uint32_t DestPortFilterMatch***
- ***uint32_t SourcePort***
- ***uint32_t DestinationPort***

Field Documentation

- ***uint32_t ETH_L4FilterConfigTypeDef::Protocol***
  Sets the L4 filter protocol to TCP or UDP This parameter can be a value of ***ETHEx_L4_Protocol***
- ***uint32_t ETH_L4FilterConfigTypeDef::SrcPortFilterMatch***
  Sets the L4 filter source port match This parameter can be a value of ***ETHEx_L4_Source_Match***
- ***uint32_t ETH_L4FilterConfigTypeDef::DestPortFilterMatch***
  Sets the L4 filter destination port match This parameter can be a value of ***ETHEx_L4_Destination_Match***
- ***uint32_t ETH_L4FilterConfigTypeDef::SourcePort***
  Sets the L4 filter source port This parameter must be a value from 0x0 to 0xFFFF
- ***uint32_t ETH_L4FilterConfigTypeDef::DestinationPort***
  Sets the L4 filter destination port This parameter must be a value from 0x0 to 0xFFFF

23.2 ETHEx Firmware driver API description

The following section lists the various functions of the ETHEx library.

23.2.1 Detailed description of functions

HAL_ETHEx_EnableARPOffload

Function name

void HAL_ETHEx_EnableARPOffload (ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_DisableARPOffload

Function name

void HAL_ETHEx_DisableARPOffload (ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_SetARPAddressMatch

Function name

void HAL_ETHEx_SetARPAddressMatch (ETH_HandleTypeDef * heth, uint32_t IpAddress)

Function description

HAL_ETHEx_EnableL3L4Filtering

Function name

void HAL_ETHEx_EnableL3L4Filtering (ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_DisableL3L4Filtering

Function name

void HAL_ETHEx_DisableL3L4Filtering (ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetL3FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetL3FilterConfig (const ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L3FilterConfigTypeDef * pL3FilterConfig)

Function description

HAL_ETHEx_GetL4FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetL4FilterConfig (const ETH_HandleTypeDef * heth, uint32_t Filter, ETH_L4FilterConfigTypeDef * pL4FilterConfig)

Function description

HAL_ETHEx_SetL3FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetL3FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, const ETH_L3FilterConfigTypeDef * pL3FilterConfig)

Function description

HAL_ETHEx_SetL4FilterConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetL4FilterConfig (ETH_HandleTypeDef * heth, uint32_t Filter, const ETH_L4FilterConfigTypeDef * pL4FilterConfig)

Function description

HAL_ETHEx_EnableVLANProcessing

Function name

void HAL_ETHEx_EnableVLANProcessing (ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_DisableVLANProcessing

Function name

void HAL_ETHEx_DisableVLANProcessing (ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetRxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetRxVLANConfig (const ETH_HandleTypeDef * heth, ETH_RxVLANConfigTypeDef * pVlanConfig)

Function description

HAL_ETHEx_SetRxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetRxVLANConfig (ETH_HandleTypeDef * heth, ETH_RxVLANConfigTypeDef * pVlanConfig)

Function description

HAL_ETHEx_SetVLANHashTable

Function name

void HAL_ETHEx_SetVLANHashTable (ETH_HandleTypeDef * heth, uint32_t VLANHashTable)

Function description

HAL_ETHEx_GetTxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetTxVLANConfig (const ETH_HandleTypeDef * heth, uint32_t VLANTag, ETH_TxVLANConfigTypeDef * pVlanConfig)

Function description

HAL_ETHEx_SetTxVLANConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetTxVLANConfig (ETH_HandleTypeDef * heth, uint32_t VLANTag, const ETH_TxVLANConfigTypeDef * pVlanConfig)

Function description

HAL_ETHEx_SetTxVLANIdentifier

Function name

void HAL_ETHEx_SetTxVLANIdentifier (ETH_HandleTypeDef * heth, uint32_t VLANTag, uint32_t VLANIdentifier)

Function description

HAL_ETHEx_EnterLPIMode

Function name

void HAL_ETHEx_EnterLPIMode (ETH_HandleTypeDef * heth, FunctionalState TxAutomate, FunctionalState TxClockStop)

Function description

HAL_ETHEx_ExitLPIMode

Function name

void HAL_ETHEx_ExitLPIMode (ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetMACLPIEvent

Function name

uint32_t HAL_ETHEx_GetMACLPIEvent (const ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetRxDMAChNumber

Function name

uint32_t HAL_ETHEx_GetRxDMAChNumber (const ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetTxDMAChNumber

Function name

uint32_t HAL_ETHEx_GetTxDMAChNumber (const ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetRxMTLQNumber

Function name

uint32_t HAL_ETHEx_GetRxMTLQNumber (const ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetTxMTLQNumber

Function name

uint32_t HAL_ETHEx_GetTxMTLQNumber (const ETH_HandleTypeDef * heth)

Function description

HAL_ETHEx_GetMTLConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetMTLConfig (const ETH_HandleTypeDef * heth, ETH_MTLConfigTypeDef * mtlconf)

Function description

HAL_ETHEx_SetMTLConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetMTLConfig (ETH_HandleTypeDef * heth, ETH_MTLConfigTypeDef * mtlconf)

Function description

HAL_ETHEx_SetMACMTLMappingConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_SetMACMTLMappingConfig (ETH_HandleTypeDef * heth, const ETH_MACMTLMappingTypeDef * macmtlconf)

Function description

HAL_ETHEx_GetMACMTLMappingConfig

Function name

HAL_StatusTypeDef HAL_ETHEx_GetMACMTLMappingConfig (const ETH_HandleTypeDef * heth, ETH_MACMTLMappingTypeDef * macmtlconf)

Function description

ETHEx_SetMTLConfig

Function name

void ETHEx_SetMTLConfig (ETH_HandleTypeDef * heth, const ETH_MTLConfigTypeDef * mtlconf)

Function description

ETHEx_SetMACMTLMappingConfig

Function name

HAL_StatusTypeDef ETHEx_SetMACMTLMappingConfig (ETH_HandleTypeDef * heth, const ETH_MACMTLMappingTypeDef * macmtlconf)

Function description

HAL_ETHEx_SetUserTagPriorityQueue

Function name

HAL_StatusTypeDef HAL_ETHEx_SetUserTagPriorityQueue (ETH_HandleTypeDef * heth, uint32_t psrq, uint32_t queue)

Function description

HAL_ETHEx_GetUserTagPriorityQueue

Function name

HAL_StatusTypeDef HAL_ETHEx_GetUserTagPriorityQueue (const ETH_HandleTypeDef * heth, uint32_t * psrq, uint32_t queue)

Function description

HAL_ETHEx_SetPacketTypeQueue

Function name

HAL_StatusTypeDef HAL_ETHEx_SetPacketTypeQueue (ETH_HandleTypeDef * heth, const ETH_PacketTypeQueueConfigTypeDef * typequeueconf)

Function description

HAL_ETHEx_GetPacketTypeQueue

Function name

HAL_StatusTypeDef HAL_ETHEx_GetPacketTypeQueue (ETH_HandleTypeDef * heth, ETH_PacketTypeQueueConfigTypeDef * typequeueconf)

Function description

23.3 ETHEx Firmware driver defines

The following section lists the various define and macros of the module.

23.3.1 ETHEx

ETHEx

ETHEx Command Type

ETH_WRITE_OPERATION

ETH_READ_OPERATION

ETHEx L3 Destination Match

ETH_L3_DEST_ADDR_PERFECT_MATCH_ENABLE

ETH_L3_DEST_ADDR_INVERSE_MATCH_ENABLE

ETH_L3_DEST_ADDR_MATCH_DISABLE

ETHEx L3 Filter

ETH_L3_FILTER_0

ETH_L3_FILTER_1

ETHEx L3 Protocol

ETH_L3_IPV6_MATCH

24 HAL EXTI Generic Driver

24.1 EXTI Firmware driver registers structures

24.1.1 EXTI_HandleTypeDef

EXTI_HandleTypeDef is defined in the stm32n6xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***void(* RisingCallback***
- ***void(* FallingCallback***

Field Documentation

- ***uint32_t EXTI_HandleTypeDef::Line***
  Exti line number
- ***void(* EXTI_HandleTypeDef::RisingCallback)(void)***
  Exti rising callback
- ***void(* EXTI_HandleTypeDef::FallingCallback)(void)***
  Exti falling callback

24.1.2 EXTI_ConfigTypeDef

EXTI_ConfigTypeDef is defined in the stm32n6xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***uint32_t Mode***
- ***uint32_t Trigger***
- ***uint32_t GPIOSel***

Field Documentation

- ***uint32_t EXTI_ConfigTypeDef::Line***
  The Exti line to be configured. This parameter can be a value of ***EXTI_Line***
- ***uint32_t EXTI_ConfigTypeDef::Mode***
  The Exit Mode to be configured for a core. This parameter can be a combination of ***EXTI_Mode***
- ***uint32_t EXTI_ConfigTypeDef::Trigger***
  The Exti Trigger to be configured. This parameter can be a value of ***EXTI_Trigger***
- ***uint32_t EXTI_ConfigTypeDef::GPIOSel***
  The Exti GPIO multiplexer selection to be configured. This parameter is only possible for line 0 to 15. It can be a value of ***EXTI_GPIOSel***

24.2 EXTI Firmware driver API description

The following section lists the various functions of the EXTI library.

24.2.1 EXTI Peripheral features

- Each Exti line can be configured within this driver.
- Exti line can be configured in 3 different modes
  - Interrupt
  - Event
  - Both of them
- Configurable Exti lines can be configured with 3 different triggers
  - Rising
  - Falling
  - Both of them

- When set in interrupt mode, configurable Exti lines have two different interrupt pending registers which allow to distinguish which transition occurs:
  - Rising edge pending interrupt
  - Falling
- Exti lines 0 to 15 are linked to gpio pin number 0 to 15. Gpio port can be selected through multiplexer.

24.2.2 How to use this driver

1. Configure the EXTI line using HAL_EXTI_SetConfigLine().
   - Choose the interrupt line number by setting "Line" member from EXTI_ConfigTypeDef structure.
   - Configure the interrupt and/or event mode using "Mode" member from EXTI_ConfigTypeDef structure.
   - For configurable lines, configure rising and/or falling trigger "Trigger" member from EXTI_ConfigTypeDef structure.
   - For Exti lines linked to gpio, choose gpio port using "GPIOSel" member from GPIO_InitTypeDef structure.
2. Get current Exti configuration of a dedicated line using HAL_EXTI_GetConfigLine().
   - Provide exiting handle as parameter.
   - Provide pointer on EXTI_ConfigTypeDef structure as second parameter.
3. Clear Exti configuration of a dedicated line using HAL_EXTI_ClearConfigLine().
   - Provide exiting handle as parameter.
4. Register callback to treat Exti interrupts using HAL_EXTI_RegisterCallback().
   - Provide exiting handle as first parameter.
   - Provide which callback will be registered using one value from EXTI_CallbackIDTypeDef.
   - Provide callback function pointer.
5. Get interrupt pending bit using HAL_EXTI_GetPending().
6. Clear interrupt pending bit using HAL_EXTI_ClearPending().
7. Generate software interrupt using HAL_EXTI_GenerateSWI().

24.2.3 EXTI attributes functions

This section contains the following APIs:

- ***HAL_EXTI_ConfigLineAttributes()***
- ***HAL_EXTI_GetConfigLineAttributes()***
- ***HAL_EXTI_LockAttributes()***
- ***HAL_EXTI_GetLockAttributes()***

24.2.4 Configuration functions

This section contains the following APIs:

- ***HAL_EXTI_SetConfigLine()***
- ***HAL_EXTI_GetConfigLine()***
- ***HAL_EXTI_ClearConfigLine()***
- ***HAL_EXTI_RegisterCallback()***
- ***HAL_EXTI_GetHandle()***

24.2.5 Detailed description of functions

HAL_EXTI_SetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_SetConfigLine (EXTI_HandleTypeDef * hexti, const EXTI_ConfigTypeDef * pExtiConfig)

Function description

Set configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on EXTI configuration to be set.

Return values

- **HAL:** Status.

HAL_EXTI_GetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_GetConfigLine (const EXTI_HandleTypeDef * hexti, EXTI_ConfigTypeDef * pExtiConfig)

Function description

Get configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on structure to store Exti configuration.

Return values

- **HAL:** Status.

HAL_EXTI_ClearConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_ClearConfigLine (const EXTI_HandleTypeDef * hexti)

Function description

Clear whole configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.

Return values

- **HAL:** Status.

HAL_EXTI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_EXTI_RegisterCallback (EXTI_HandleTypeDef * hexti, EXTI_CallbackIDTypeDef CallbackID, void(*)(void) pPendingCbfn)

Function description

Register callback for a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **CallbackID:** User callback identifier. This parameter can be one of
  - EXTI_CallbackIDTypeDef values.
- **pPendingCbfn:** function pointer to be stored as callback.

Return values

- **HAL:** Status.

HAL_EXTI_GetHandle

Function name

HAL_StatusTypeDef HAL_EXTI_GetHandle (EXTI_HandleTypeDef * hexti, uint32_t ExtiLine)

Function description

Store line number as handle private field.

Parameters

- **hexti:** Exti handle.
- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.

Return values

- **HAL:** Status.

HAL_EXTI_IRQHandler

Function name

void HAL_EXTI_IRQHandler (const EXTI_HandleTypeDef * hexti)

Function description

Handle EXTI interrupt request.

Parameters

- **hexti:** Exti handle.

Return values

- **none.:**

HAL_EXTI_GetPending

Function name

uint32_t HAL_EXTI_GetPending (const EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Get interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be checked. This parameter can be one of the following values:
  - EXTI_TRIGGER_RISING
  - EXTI_TRIGGER_FALLING

Return values

- **1:** if interrupt is pending else 0.

HAL_EXTI_ClearPending

Function name

void HAL_EXTI_ClearPending (const EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Clear interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be clear. This parameter can be one of the following values:
  - EXTI_TRIGGER_RISING
  - EXTI_TRIGGER_FALLING

Return values

- **None.:**

HAL_EXTI_GenerateSWI

Function name

void HAL_EXTI_GenerateSWI (const EXTI_HandleTypeDef * hexti)

Function description

Generate a software interrupt for a dedicated line.

Parameters

- **hexti:** Exti handle.

Return values

- **None.:**

HAL_EXTI_ConfigLineAttributes

Function name

void HAL_EXTI_ConfigLineAttributes (uint32_t ExtiLine, uint32_t LineAttributes)

Function description

Configure the EXTI line attribute(s).

Parameters

- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.
- **LineAttributes:** can be one or a combination of the following values:
  - EXTI_LINE_PRIV Privileged-only access
  - EXTI_LINE_NPRIV Privileged/Non-privileged access
  - EXTI_LINE_SEC Secure-only access
  - EXTI_LINE_NSEC Secure/Non-secure access

Return values

- **None:**

Notes

- Available attributes are to secure EXTI line and set EXTI line as privileged. Default state is not secure and unprivileged access allowed.
- Set an EXTI line to secure is only available in secure and privilege Set an EXTI line to privilege is only available in privilege
- Security and privilege attributes can be set independently.

HAL_EXTI_GetConfigLineAttributes

Function name

HAL_StatusTypeDef HAL_EXTI_GetConfigLineAttributes (uint32_t ExtiLine, uint32_t * pLineAttributes)

Function description

Get the EXTI line attribute(s).

Parameters

- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.
- **pLineAttributes:** pointer to return line attributes.

Return values

- **HAL:** Status.

HAL_EXTI_LockAttributes

Function name

void HAL_EXTI_LockAttributes (void)

Function description

Lock the secure and privilege configuration registers.

Return values

- **None:**

HAL_EXTI_GetLockAttributes

Function name

uint32_t HAL_EXTI_GetLockAttributes (void)

Function description

Return the secure and privilege configuration registers LOCK status.

Return values

- **1:** if the secure and privilege configuration registers have been locked else 0.

25 HAL FDCAN Generic Driver

25.1 FDCAN Firmware driver registers structures

25.1.1 FDCAN_InitTypeDef

FDCAN_InitTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t FrameFormat***
- ***uint32_t Mode***
- ***FunctionalState AutoRetransmission***
- ***FunctionalState TransmitPause***
- ***FunctionalState ProtocolException***
- ***uint32_t NominalPrescaler***
- ***uint32_t NominalSyncJumpWidth***
- ***uint32_t NominalTimeSeg1***
- ***uint32_t NominalTimeSeg2***
- ***uint32_t DataPrescaler***
- ***uint32_t DataSyncJumpWidth***
- ***uint32_t DataTimeSeg1***
- ***uint32_t DataTimeSeg2***
- ***uint32_t MessageRAMOffset***
- ***uint32_t StdFiltersNbr***
- ***uint32_t ExtFiltersNbr***
- ***uint32_t RxFifo0ElmtsNbr***
- ***uint32_t RxFifo0ElmtSize***
- ***uint32_t RxFifo1ElmtsNbr***
- ***uint32_t RxFifo1ElmtSize***
- ***uint32_t RxBuffersNbr***
- ***uint32_t RxBufferSize***
- ***uint32_t TxEventsNbr***
- ***uint32_t TxBuffersNbr***
- ***uint32_t TxFifoQueueElmtsNbr***
- ***uint32_t TxFifoQueueMode***
- ***uint32_t TxElmtSize***

Field Documentation

- ***uint32_t FDCAN_InitTypeDef::FrameFormat***
  Specifies the FDCAN frame format. This parameter can be a value of ***FDCAN_frame_format***
- ***uint32_t FDCAN_InitTypeDef::Mode***
  Specifies the FDCAN mode. This parameter can be a value of ***FDCAN_operating_mode***
- ***FunctionalState FDCAN_InitTypeDef::AutoRetransmission***
  Enable or disable the automatic retransmission mode. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::TransmitPause***
  Enable or disable the Transmit Pause feature. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::ProtocolException***
  Enable or disable the Protocol Exception Handling. This parameter can be set to ENABLE or DISABLE
- ***uint32_t FDCAN_InitTypeDef::NominalPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the nominal bit time quanta. This parameter must be a number between 1 and 512

- ***uint32_t FDCAN_InitTypeDef::NominalSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a bit to perform resynchronization. This parameter must be a number between 1 and 128
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg1***
  Specifies the number of time quanta in Bit Segment 1. This parameter must be a number between 2 and 256
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg2***
  Specifies the number of time quanta in Bit Segment 2. This parameter must be a number between 2 and 128
- ***uint32_t FDCAN_InitTypeDef::DataPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the data bit time quanta. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a data bit to perform resynchronization. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg1***
  Specifies the number of time quanta in Data Bit Segment 1. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg2***
  Specifies the number of time quanta in Data Bit Segment 2. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::MessageRAMOffset***
  Specifies the message RAM start address. This parameter must be a number between 0 and 2560
- ***uint32_t FDCAN_InitTypeDef::StdFiltersNbr***
  Specifies the number of standard Message ID filters. This parameter must be a number between 0 and 128
- ***uint32_t FDCAN_InitTypeDef::ExtFiltersNbr***
  Specifies the number of extended Message ID filters. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxFifo0ElmtsNbr***
  Specifies the number of Rx FIFO0 Elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxFifo0ElmtSize***
  Specifies the Data Field Size in an Rx FIFO 0 element. This parameter can be a value of ***FDCAN_data_field_size***
- ***uint32_t FDCAN_InitTypeDef::RxFifo1ElmtsNbr***
  Specifies the number of Rx FIFO 1 Elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxFifo1ElmtSize***
  Specifies the Data Field Size in an Rx FIFO 1 element. This parameter can be a value of ***FDCAN_data_field_size***
- ***uint32_t FDCAN_InitTypeDef::RxBuffersNbr***
  Specifies the number of Dedicated Rx Buffer elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_InitTypeDef::RxBufferSize***
  Specifies the Data Field Size in an Rx Buffer element. This parameter can be a value of ***FDCAN_data_field_size***
- ***uint32_t FDCAN_InitTypeDef::TxEventsNbr***
  Specifies the number of Tx Event FIFO elements. This parameter must be a number between 0 and 32
- ***uint32_t FDCAN_InitTypeDef::TxBuffersNbr***
  Specifies the number of Dedicated Tx Buffers. This parameter must be a number between 0 and 32
- ***uint32_t FDCAN_InitTypeDef::TxFifoQueueElmtsNbr***
  Specifies the number of Tx Buffers used for Tx FIFO/Queue. This parameter must be a number between 0 and 32
- ***uint32_t FDCAN_InitTypeDef::TxFifoQueueMode***
  Tx FIFO/Queue Mode selection. This parameter can be a value of ***FDCAN_txFifoQueue_Mode***
- ***uint32_t FDCAN_InitTypeDef::TxElmtSize***
  Specifies the Data Field Size in a Tx Element. This parameter can be a value of ***FDCAN_data_field_size***

25.1.2 FDCAN_ClkCalUnitTypeDef

FDCAN_ClkCalUnitTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t ClockCalibration***
- ***uint32_t ClockDivider***
- ***uint32_t MinOscClkPeriods***
- ***uint32_t CalFieldLength***
- ***uint32_t TimeQuantaPerBitTime***
- ***uint32_t WatchdogStartValue***

Field Documentation

- ***uint32_t FDCAN_ClkCalUnitTypeDef::ClockCalibration***
  Enable or disable the clock calibration. This parameter can be a value of ***FDCAN_clock_calibration***.
- ***uint32_t FDCAN_ClkCalUnitTypeDef::ClockDivider***
  Specifies the FDCAN kernel clock divider when the clock calibration is bypassed. This parameter can be a value of ***FDCAN_clock_divider***
- ***uint32_t FDCAN_ClkCalUnitTypeDef::MinOscClkPeriods***
  Configures the minimum number of periods in two CAN bit times. The actual configured number of periods is MinOscClkPeriods x 32. This parameter must be a number between 0x00 and 0xFF
- ***uint32_t FDCAN_ClkCalUnitTypeDef::CalFieldLength***
  Specifies the calibration field length. This parameter can be a value of ***FDCAN_calibration_field_length***
- ***uint32_t FDCAN_ClkCalUnitTypeDef::TimeQuantaPerBitTime***
  Configures the number of time quanta per bit time. This parameter must be a number between 4 and 25
- ***uint32_t FDCAN_ClkCalUnitTypeDef::WatchdogStartValue***
  Start value of the Calibration Watchdog Counter. If set to zero the counter is disabled. This parameter must be a number between 0x0000 and 0xFFFF

25.1.3 FDCAN_FilterTypeDef

FDCAN_FilterTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t IdType***
- ***uint32_t FilterIndex***
- ***uint32_t FilterType***
- ***uint32_t FilterConfig***
- ***uint32_t FilterID1***
- ***uint32_t FilterID2***
- ***uint32_t RxBufferIndex***
- ***uint32_t IsCalibrationMsg***

Field Documentation

- ***uint32_t FDCAN_FilterTypeDef::IdType***
  Specifies the identifier type. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_FilterTypeDef::FilterIndex***
  Specifies the filter which will be initialized. This parameter must be a number between:
  - 0 and 127, if IdType is FDCAN_STANDARD_ID
  - 0 and 63, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::FilterType***
  Specifies the filter type. This parameter can be a value of ***FDCAN_filter_type***. The value FDCAN_EXT_FILTER_RANGE_NO_EIDM is permitted only when IdType is FDCAN_EXTENDED_ID. This parameter is ignored if FilterConfig is set to FDCAN_FILTER_TO_RXBUFFER
- ***uint32_t FDCAN_FilterTypeDef::FilterConfig***
  Specifies the filter configuration. This parameter can be a value of ***FDCAN_filter_config***
- ***uint32_t FDCAN_FilterTypeDef::FilterID1***
  Specifies the filter identification 1. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID

- ***uint32_t FDCAN_FilterTypeDef::FilterID2***
  Specifies the filter identification 2. This parameter is ignored if FilterConfig is set to FDCAN_FILTER_TO_RXBUFFER. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::RxBufferIndex***
  Contains the index of the Rx buffer in which the matching message will be stored. This parameter must be a number between 0 and 63. This parameter is ignored if FilterConfig is different from FDCAN_FILTER_TO_RXBUFFER
- ***uint32_t FDCAN_FilterTypeDef::IsCalibrationMsg***
  Specifies whether the filter is configured for calibration messages. This parameter is ignored if FilterConfig is different from FDCAN_FILTER_TO_RXBUFFER. This parameter can be:
  - 0 : ordinary message
  - 1 : calibration message

25.1.4 FDCAN_TxHeaderTypeDef

FDCAN_TxHeaderTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxEventFifoControl***
- ***uint32_t MessageMarker***

Field Documentation

- ***uint32_t FDCAN_TxHeaderTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxHeaderTypeDef::IdType***
  Specifies the identifier type for the message that will be transmitted. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxFrameType***
  Specifies the frame type of the message that will be transmitted. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::DataLength***
  Specifies the length of the frame that will be transmitted. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_TxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Tx frame will be transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxHeaderTypeDef::FDFormat***
  Specifies whether the Tx frame will be transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxEventFifoControl***
  Specifies the event FIFO control. This parameter can be a value of ***Section 25.3.1: FDCAN_EFC***
- ***uint32_t FDCAN_TxHeaderTypeDef::MessageMarker***
  Specifies the message marker to be copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF

25.1.5 FDCAN_RxHeaderTypeDef

FDCAN_RxHeaderTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t RxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t RxTimestamp***
- ***uint32_t FilterIndex***
- ***uint32_t IsFilterMatchingFrame***

Field Documentation

- ***uint32_t FDCAN_RxHeaderTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_RxHeaderTypeDef::IdType***
  Specifies the identifier type of the received message. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxFrameType***
  Specifies the the received message frame type. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::DataLength***
  Specifies the received frame length. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_RxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_RxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Rx frame is received with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_RxHeaderTypeDef::FDFormat***
  Specifies whether the Rx frame is received in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxTimestamp***
  Specifies the timestamp counter value captured on start of frame reception. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_RxHeaderTypeDef::FilterIndex***
  Specifies the index of matching Rx acceptance filter element. This parameter must be a number between:
  – 0 and 127, if IdType is FDCAN_STANDARD_ID
  – 0 and 63, if IdType is FDCAN_EXTENDED_ID When the frame is a Non-Filter matching frame, this parameter is unused.
- ***uint32_t FDCAN_RxHeaderTypeDef::IsFilterMatchingFrame***
  Specifies whether the accepted frame did not match any Rx filter. Acceptance of non-matching frames may be enabled via **HAL_FDCAN_ConfigGlobalFilter()**. This parameter takes 0 if the frame matched an Rx filter or 1 if it did not match any Rx filter

25.1.6 FDCAN_TxEventFifoTypeDef

FDCAN_TxEventFifoTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***

- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxTimestamp***
- ***uint32_t MessageMarker***
- ***uint32_t EventType***

Field Documentation

- ***uint32_t FDCAN_TxEventFifoTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  - 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  - 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxEventFifoTypeDef::IdType***
  Specifies the identifier type for the transmitted message. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TxEventFifoTypeDef::TxFrameType***
  Specifies the frame type of the transmitted message. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxEventFifoTypeDef::DataLength***
  Specifies the length of the transmitted frame. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_TxEventFifoTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxEventFifoTypeDef::BitRateSwitch***
  Specifies whether the Tx frame is transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxEventFifoTypeDef::FDFormat***
  Specifies whether the Tx frame is transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxEventFifoTypeDef::TxTimestamp***
  Specifies the timestamp counter value captured on start of frame transmission. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::MessageMarker***
  Specifies the message marker copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::EventType***
  Specifies the event type. This parameter can be a value of ***FDCAN_event_type***

25.1.7 FDCAN_HpMsgStatusTypeDef

FDCAN_HpMsgStatusTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t FilterList***
- ***uint32_t FilterIndex***
- ***uint32_t MessageStorage***
- ***uint32_t MessageIndex***

Field Documentation

- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterList***
  Specifies the filter list of the matching filter element. This parameter can be:
  - 0 : Standard Filter List
  - 1 : Extended Filter List
- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterIndex***
  Specifies the index of matching filter element. This parameter can be a number between:
  - 0 and 127, if FilterList is 0 (Standard)
  - 0 and 63, if FilterList is 1 (Extended)
- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageStorage***
  Specifies the HP Message Storage. This parameter can be a value of ***FDCAN_hp_msg_storage***

- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageIndex***
  Specifies the Index of Rx FIFO element to which the message was stored. This parameter is valid only when MessageStorage is: FDCAN_HP_STORAGE_RXFIFO0 or FDCAN_HP_STORAGE_RXFIFO1

25.1.8 FDCAN_ProtocolStatusTypeDef

FDCAN_ProtocolStatusTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t LastErrorCode***
- ***uint32_t DataLastErrorCode***
- ***uint32_t Activity***
- ***uint32_t ErrorPassive***
- ***uint32_t Warning***
- ***uint32_t BusOff***
- ***uint32_t RxESIflag***
- ***uint32_t RxBRSflag***
- ***uint32_t RxFDFflag***
- ***uint32_t ProtocolException***
- ***uint32_t TDCvalue***

Field Documentation

- ***uint32_t FDCAN_ProtocolStatusTypeDef::LastErrorCode***
  Specifies the type of the last error that occurred on the FDCAN bus. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::DataLastErrorCode***
  Specifies the type of the last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::Activity***
  Specifies the FDCAN module communication state. This parameter can be a value of ***FDCAN_communication_state***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::ErrorPassive***
  Specifies the FDCAN module error status. This parameter can be:
  - 0 : The FDCAN is in Error_Active state
  - 1 : The FDCAN is in Error_Passive state
- ***uint32_t FDCAN_ProtocolStatusTypeDef::Warning***
  Specifies the FDCAN module warning status. This parameter can be:
  - 0 : error counters (RxErrorCnt and TxErrorCnt) are below the Error_Warning limit of 96
  - 1 : at least one of error counters has reached the Error_Warning limit of 96
- ***uint32_t FDCAN_ProtocolStatusTypeDef::BusOff***
  Specifies the FDCAN module Bus_Off status. This parameter can be:
  - 0 : The FDCAN is not in Bus_Off state
  - 1 : The FDCAN is in Bus_Off state
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxESIflag***
  Specifies ESI flag of last received CAN FD message. This parameter can be:
  - 0 : Last received CAN FD message did not have its ESI flag set
  - 1 : Last received CAN FD message had its ESI flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxBRSflag***
  Specifies BRS flag of last received CAN FD message. This parameter can be:
  - 0 : Last received CAN FD message did not have its BRS flag set
  - 1 : Last received CAN FD message had its BRS flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxFDFflag***
  Specifies if CAN FD message (FDF flag set) has been received since last protocol status. This parameter can be:
  - 0 : No CAN FD message received
  - 1 : CAN FD message received

- ***uint32_t FDCAN_ProtocolStatusTypeDef::ProtocolException***
  Specifies the FDCAN module Protocol Exception status. This parameter can be:
  - 0 : No protocol exception event occurred since last read access
  - 1 : Protocol exception event occurred
- ***uint32_t FDCAN_ProtocolStatusTypeDef::TDCvalue***
  Specifies the Transmitter Delay Compensation Value. This parameter can be a number between 0 and 127

25.1.9 FDCAN_ErrorCountersTypeDef

FDCAN_ErrorCountersTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t TxErrorCnt***
- ***uint32_t RxErrorCnt***
- ***uint32_t RxErrorPassive***
- ***uint32_t ErrorLogging***

Field Documentation

- ***uint32_t FDCAN_ErrorCountersTypeDef::TxErrorCnt***
  Specifies the Transmit Error Counter Value. This parameter can be a number between 0 and 255
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorCnt***
  Specifies the Receive Error Counter Value. This parameter can be a number between 0 and 127
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorPassive***
  Specifies the Receive Error Passive status. This parameter can be:
  - 0 : The Receive Error Counter (RxErrorCnt) is below the error passive level of 128
  - 1 : The Receive Error Counter (RxErrorCnt) has reached the error passive level of 128
- ***uint32_t FDCAN_ErrorCountersTypeDef::ErrorLogging***
  Specifies the Transmit/Receive error logging counter value. This parameter can be a number between 0 and 255. This counter is incremented each time when a FDCAN protocol error causes the TxErrorCnt or the RxErrorCnt to be incremented. The counter stops at 255; the next increment of TxErrorCnt or RxErrorCnt sets interrupt flag FDCAN_FLAG_ERROR_LOGGING_OVERFLOW

25.1.10 FDCAN_TT_ConfigTypeDef

FDCAN_TT_ConfigTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t OperationMode***
- ***uint32_t GapEnable***
- ***uint32_t TimeMaster***
- ***uint32_t SyncDevLimit***
- ***uint32_t InitRefTrigOffset***
- ***uint32_t ExternalClkSync***
- ***uint32_t AppWdgLimit***
- ***uint32_t GlobalTimeFilter***
- ***uint32_t ClockCalibration***
- ***uint32_t EvtTrigPolarity***
- ***uint32_t BasicCyclesNbr***
- ***uint32_t CycleStartSync***
- ***uint32_t TxEnableWindow***
- ***uint32_t ExpTxTrigNbr***
- ***uint32_t TURNumerator***
- ***uint32_t TURDenominator***
- ***uint32_t TriggerMemoryNbr***
- ***uint32_t StopWatchTrigSel***
- ***uint32_t EventTrigSel***

Field Documentation

- ***uint32_t FDCAN_TT_ConfigTypeDef::OperationMode***
  Specifies the FDCAN Operation Mode. This parameter can be a value of ***FDCAN_operation_mode***
- ***uint32_t FDCAN_TT_ConfigTypeDef::GapEnable***
  Specifies the FDCAN TT Operation. This parameter can be a value of ***FDCAN_TT_operation***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL0
- ***uint32_t FDCAN_TT_ConfigTypeDef::TimeMaster***
  Specifies whether the instance is a slave or a potential master. This parameter can be a value of ***FDCAN_TT_time_master***
- ***uint32_t FDCAN_TT_ConfigTypeDef::SyncDevLimit***
  Specifies the Synchronization Deviation Limit SDL of the TUR numerator : TUR = (Numerator +/- SDL) / Denominator. With : SDL = 2^(SyncDevLimit+5). This parameter must be a number between 0 and 7
- ***uint32_t FDCAN_TT_ConfigTypeDef::InitRefTrigOffset***
  Specifies the Initial Reference Trigger Offset. This parameter must be a number between 0 and 127
- ***uint32_t FDCAN_TT_ConfigTypeDef::ExternalClkSync***
  Enable or disable External Clock Synchronization. This parameter can be a value of ***FDCAN_TT_external_clk_sync***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL1
- ***uint32_t FDCAN_TT_ConfigTypeDef::AppWdgLimit***
  Specifies the Application Watchdog Limit : maximum time after which the application has to serve the application watchdog. The application watchdog is incremented once each 256 NTUs. The application watchdog can be disabled by setting AppWdgLimit to 0. This parameter must be a number between 0 and 255. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL0
- ***uint32_t FDCAN_TT_ConfigTypeDef::GlobalTimeFilter***
  Enable or disable Global Time Filtering. This parameter can be a value of ***FDCAN_TT_global_time_filtering***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL1
- ***uint32_t FDCAN_TT_ConfigTypeDef::ClockCalibration***
  Enable or disable Automatic Clock Calibration. This parameter can be a value of ***FDCAN_TT_auto_clk_calibration***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL1
- ***uint32_t FDCAN_TT_ConfigTypeDef::EvtTrigPolarity***
  Specifies the Event Trigger Polarity. This parameter can be a value of ***FDCAN_TT_event_trig_polarity***. This parameter is ignored if OperationMode is set to FDCAN_TT_COMMUNICATION_LEVEL0
- ***uint32_t FDCAN_TT_ConfigTypeDef::BasicCyclesNbr***
  Specifies the number of basic cycles in the system matrix. This parameter can be a value of ***FDCAN_TT_basic_cycle_number***
- ***uint32_t FDCAN_TT_ConfigTypeDef::CycleStartSync***
  Enable or disable synchronization pulse output at pin fdcan1_soc. This parameter can be a value of ***FDCAN_TT_cycle_start_sync***
- ***uint32_t FDCAN_TT_ConfigTypeDef::TxEnableWindow***
  Specifies the length of Tx enable window in NTUs. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_TT_ConfigTypeDef::ExpTxTrigNbr***
  Specifies the number of expected Tx_Triggers in the system matrix. This is the sum of Tx_Triggers for exclusive, single arbitrating and merged arbitrating windows. This parameter must be a number between 0 and 4095
- ***uint32_t FDCAN_TT_ConfigTypeDef::TURNumerator***
  Specifies the TUR (Time Unit Ratio) numerator. It is advised to set this parameter to the largest applicable value. This parameter must be a number between 0x10000 and 0x1FFFF
- ***uint32_t FDCAN_TT_ConfigTypeDef::TURDenominator***
  Specifies the TUR (Time Unit Ratio) denominator. This parameter must be a number between 0x0001 and 0x3FFF
- ***uint32_t FDCAN_TT_ConfigTypeDef::TriggerMemoryNbr***
  Specifies the number of trigger memory elements. This parameter must be a number between 0 and 64
- ***uint32_t FDCAN_TT_ConfigTypeDef::StopWatchTrigSel***
  Specifies the input to be used as stop watch trigger. This parameter can be a value of ***FDCAN_TT_stop_watch_trig_selection***

- ***uint32_t FDCAN_TT_ConfigTypeDef::EventTrigSel***
  Specifies the input to be used as event trigger. This parameter can be a value of ***FDCAN_TT_event_trig_selection***

25.1.11 FDCAN_TriggerTypeDef

FDCAN_TriggerTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t TriggerIndex***
- ***uint32_t TimeMark***
- ***uint32_t RepeatFactor***
- ***uint32_t StartCycle***
- ***uint32_t TmEventInt***
- ***uint32_t TmEventExt***
- ***uint32_t TriggerType***
- ***uint32_t FilterType***
- ***uint32_t TxBufferIndex***
- ***uint32_t FilterIndex***

Field Documentation

- ***uint32_t FDCAN_TriggerTypeDef::TriggerIndex***
  Specifies the trigger which will be configured. This parameter must be a number between 0 and 63
- ***uint32_t FDCAN_TriggerTypeDef::TimeMark***
  Specifies the cycle time for which the trigger becomes active. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_TriggerTypeDef::RepeatFactor***
  Specifies the trigger repeat factor. This parameter can be a value of ***FDCAN_TT_Repeat_Factor***
- ***uint32_t FDCAN_TriggerTypeDef::StartCycle***
  Specifies the index of the first cycle in which the trigger becomes active. This parameter is ignored if RepeatFactor is set to FDCAN_TT_REPEAT_EVERY_CYCLE. This parameter must be a number between 0 and RepeatFactor
- ***uint32_t FDCAN_TriggerTypeDef::TmEventInt***
  Enable or disable the internal time mark event. If enabled, FDCAN_TT_FLAG_TRIG_TIME_MARK flag is set when trigger memory element becomes active. This parameter can be a value of ***FDCAN_TT_Time_Mark_Event_Internal***
- ***uint32_t FDCAN_TriggerTypeDef::TmEventExt***
  Enable or disable the external time mark event. If enabled, and if TTOCN.TTIE is set, a pulse is generated at fdcan1_tmp when trigger memory element becomes active. This parameter can be a value of ***FDCAN_TT_Time_Mark_Event_External***
- ***uint32_t FDCAN_TriggerTypeDef::TriggerType***
  Specifies the trigger type. This parameter can be a value of ***FDCAN_TT_Trigger_Type***
- ***uint32_t FDCAN_TriggerTypeDef::FilterType***
  Specifies the filter identifier type. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TriggerTypeDef::TxBufferIndex***
  Specifies the index of the Tx buffer for which the trigger is valid. This parameter can be a value of ***FDCAN_Tx_location***. This parameter is taken in consideration only if the trigger is configured for transmission.
- ***uint32_t FDCAN_TriggerTypeDef::FilterIndex***
  Specifies the filter for which the trigger is valid. This parameter is taken in consideration only if the trigger is configured for reception. This parameter must be a number between:
  - 0 and 127, if FilterType is FDCAN_STANDARD_ID
  - 0 and 63, if FilterType is FDCAN_EXTENDED_ID

25.1.12 FDCAN_TTOperationStatusTypeDef

FDCAN_TTOperationStatusTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t ErrorLevel***
- ***uint32_t MasterState***
- ***uint32_t SyncState***
- ***uint32_t GTimeQuality***
- ***uint32_t ClockQuality***
- ***uint32_t RefTrigOffset***
- ***uint32_t GTimeDiscPending***
- ***uint32_t GapFinished***
- ***uint32_t MasterPriority***
- ***uint32_t GapStarted***
- ***uint32_t WaitForEvt***
- ***uint32_t AppWdgEvt***
- ***uint32_t ECSPending***
- ***uint32_t PhaseLock***

Field Documentation

- ***uint32_t FDCAN_TTOperationStatusTypeDef::ErrorLevel***
  Specifies the type of the TT operation error level. This parameter can be a value of ***FDCAN_TT_error_level***
- ***uint32_t FDCAN_TTOperationStatusTypeDef::MasterState***
  Specifies the type of the TT master state. This parameter can be a value of ***FDCAN_TT_master_state***
- ***uint32_t FDCAN_TTOperationStatusTypeDef::SyncState***
  Specifies the type of the TT synchronization state. This parameter can be a value of ***FDCAN_TT_sync_state***
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GTimeQuality***
  Specifies the Quality of Global Time Phase. This parameter is only relevant in Level 0 and Level 2, otherwise fixed to 0. This parameter can be:
  – 0 : Global time not valid
  – 1 : Global time in phase with Time Master
- ***uint32_t FDCAN_TTOperationStatusTypeDef::ClockQuality***
  Specifies the Quality of Clock Speed. This parameter is only relevant in Level 0 and Level 2, otherwise fixed to 1. This parameter can be:
  – 0 : Local clock speed not synchronized to Time Master clock speed
  – 1 : Synchronization Deviation = SDL
- ***uint32_t FDCAN_TTOperationStatusTypeDef::RefTrigOffset***
  Specifies the Actual Reference Trigger Offset Value. This parameter can be a number between 0 and 0xFF
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GTimeDiscPending***
  Specifies the Global Time Discontinuity State. This parameter can be:
  – 0 : No global time preset pending
  – 1 : Node waits for the global time preset to take effect
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GapFinished***
  Specifies whether a Gap is finished. This parameter can be:
  – 0 : Reset at the end of each reference message
  – 1 : Gap finished
- ***uint32_t FDCAN_TTOperationStatusTypeDef::MasterPriority***
  Specifies the Priority of actual Time Master. This parameter can be a number between 0 and 0x7
- ***uint32_t FDCAN_TTOperationStatusTypeDef::GapStarted***
  Specifies whether a Gap is started. This parameter can be:
  – 0 : No Gap in schedule
  – 1 : Gap time after Basic Cycle has started
- ***uint32_t FDCAN_TTOperationStatusTypeDef::WaitForEvt***
  Specifies whether a Gap is announced. This parameter can be:
  – 0 : No Gap announced, reset by a reference message with Next_is_Gap = 0
  – 1 : Reference message with Next_is_Gap = 1 received

- ***uint32_t FDCAN_TTOperationStatusTypeDef::AppWdgEvt***
  Specifies the Application Watchdog State. This parameter can be:
  - 0 : Application Watchdog served in time
  - 1 : Failed to serve Application Watchdog in time
- ***uint32_t FDCAN_TTOperationStatusTypeDef::ECSPending***
  Specifies the External Clock Synchronization State. This parameter can be:
  - 0 : No external clock synchronization pending
  - 1 : Node waits for external clock synchronization to take effect
- ***uint32_t FDCAN_TTOperationStatusTypeDef::PhaseLock***
  Specifies the Phase Lock State. This parameter can be:
  - 0 : Phase outside range
  - 1 : Phase inside range

25.1.13 FDCAN_MsgRamAddressTypeDef

FDCAN_MsgRamAddressTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***uint32_t StandardFilterSA***
- ***uint32_t ExtendedFilterSA***
- ***uint32_t RxFIFO0SA***
- ***uint32_t RxFIFO1SA***
- ***uint32_t RxBufferSA***
- ***uint32_t TxEventFIFOSA***
- ***uint32_t TxBufferSA***
- ***uint32_t TxFIFOQSA***
- ***uint32_t TTMemorySA***
- ***uint32_t EndAddress***

Field Documentation

- ***uint32_t FDCAN_MsgRamAddressTypeDef::StandardFilterSA***
  Specifies the Standard Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::ExtendedFilterSA***
  Specifies the Extended Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO0SA***
  Specifies the Rx FIFO 0 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO1SA***
  Specifies the Rx FIFO 1 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxBufferSA***
  Specifies the Rx Buffer Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxEventFIFOSA***
  Specifies the Tx Event FIFO Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxBufferSA***
  Specifies the Tx Buffers Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxFIFOQSA***
  Specifies the Tx FIFO/Queue Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TTMemorySA***
  Specifies the Trigger Memory Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::EndAddress***
  Specifies the End Address of the allocated RAM. This parameter must be a 32-bit word address

25.1.14 __FDCAN_HandleTypeDef

__FDCAN_HandleTypeDef is defined in the stm32n6xx_hal_fdcan.h

Data Fields

- ***FDCAN_GlobalTypeDef * Instance***

- ***TTCAN_TypeDef * ttcan***
- ***FDCAN_InitTypeDef Init***
- ***FDCAN_MsgRamAddressTypeDef msgRam***
- ***uint32_t LatestTxFifoQRequest***
- ***__IO HAL_FDCAN_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***
- ***void(* ClockCalibrationCallback***
- ***void(* TxEventFifoCallback***
- ***void(* RxFifo0Callback***
- ***void(* RxFifo1Callback***
- ***void(* TxFifoEmptyCallback***
- ***void(* TxBufferCompleteCallback***
- ***void(* TxBufferAbortCallback***
- ***void(* RxBufferNewMessageCallback***
- ***void(* HighPriorityMessageCallback***
- ***void(* TimestampWraparoundCallback***
- ***void(* TimeoutOccurredCallback***
- ***void(* ErrorCallback***
- ***void(* ErrorStatusCallback***
- ***void(* TT_ScheduleSyncCallback***
- ***void(* TT_TimeMarkCallback***
- ***void(* TT_StopWatchCallback***
- ***void(* TT_GlobalTimeCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***FDCAN_GlobalTypeDef* __FDCAN_HandleTypeDef::Instance***
  Register base address
- ***TTCAN_TypeDef* __FDCAN_HandleTypeDef::ttcan***
  TT register base address
- ***FDCAN_InitTypeDef __FDCAN_HandleTypeDef::Init***
  FDCAN required parameters
- ***FDCAN_MsgRamAddressTypeDef __FDCAN_HandleTypeDef::msgRam***
  FDCAN Message RAM blocks
- ***uint32_t __FDCAN_HandleTypeDef::LatestTxFifoQRequest***
  FDCAN Tx buffer index of latest Tx FIFO/Queue request
- ***__IO HAL_FDCAN_StateTypeDef __FDCAN_HandleTypeDef::State***
  FDCAN communication state
- ***HAL_LockTypeDef __FDCAN_HandleTypeDef::Lock***
  FDCAN locking object
- ***__IO uint32_t __FDCAN_HandleTypeDef::ErrorCode***
  FDCAN Error code
- ***void(* __FDCAN_HandleTypeDef::ClockCalibrationCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t ClkCalibrationITs)***
  FDCAN Clock Calibration callback
- ***void(* __FDCAN_HandleTypeDef::TxEventFifoCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TxEventFifoITs)***
  FDCAN Tx Event Fifo callback
- ***void(* __FDCAN_HandleTypeDef::RxFifo0Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo0ITs)***
  FDCAN Rx Fifo 0 callback

- ***void(* __FDCAN_HandleTypeDef::RxFifo1Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo1ITs)***
  FDCAN Rx Fifo 1 callback
- ***void(* __FDCAN_HandleTypeDef::TxFifoEmptyCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Tx Fifo Empty callback
- ***void(* __FDCAN_HandleTypeDef::TxBufferCompleteCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer complete callback
- ***void(* __FDCAN_HandleTypeDef::TxBufferAbortCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer abort callback
- ***void(* __FDCAN_HandleTypeDef::RxBufferNewMessageCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Rx Buffer New Message callback
- ***void(* __FDCAN_HandleTypeDef::HighPriorityMessageCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN High priority message callback
- ***void(* __FDCAN_HandleTypeDef::TimestampWraparoundCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timestamp wraparound callback
- ***void(* __FDCAN_HandleTypeDef::TimeoutOccurredCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timeout occurred callback
- ***void(* __FDCAN_HandleTypeDef::ErrorCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Error callback
- ***void(* __FDCAN_HandleTypeDef::ErrorStatusCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t ErrorStatusITs)***
  FDCAN Error status callback
- ***void(* __FDCAN_HandleTypeDef::TT_ScheduleSyncCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TTSchedSyncITs)***
  FDCAN T Schedule Synchronization callback
- ***void(* __FDCAN_HandleTypeDef::TT_TimeMarkCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TTTimeMarkITs)***
  FDCAN TT Time Mark callback
- ***void(* __FDCAN_HandleTypeDef::TT_StopWatchCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t SWTime, uint32_t SWCycleCount)***
  FDCAN TT Stop Watch callback
- ***void(* __FDCAN_HandleTypeDef::TT_GlobalTimeCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TTGlobTimeITs)***
  FDCAN TT Global Time callback
- ***void(* __FDCAN_HandleTypeDef::MspInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp Init callback
- ***void(* __FDCAN_HandleTypeDef::MspDeInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp DeInit callback

25.2 FDCAN Firmware driver API description

The following section lists the various functions of the FDCAN library.

25.2.1 How to use this driver

1. Initialize the FDCAN peripheral using HAL_FDCAN_Init function.

2. If needed , configure the reception filters and optional features using the following configuration functions:
   - HAL_FDCAN_ConfigClockCalibration
   - HAL_FDCAN_ConfigFilter
   - HAL_FDCAN_ConfigGlobalFilter
   - HAL_FDCAN_ConfigExtendedIdMask
   - HAL_FDCAN_ConfigRxFifoOverwrite
   - HAL_FDCAN_ConfigFifoWatermark
   - HAL_FDCAN_ConfigRamWatchdog
   - HAL_FDCAN_ConfigTimestampCounter
   - HAL_FDCAN_EnableTimestampCounter
   - HAL_FDCAN_DisableTimestampCounter
   - HAL_FDCAN_ConfigTimeoutCounter
   - HAL_FDCAN_EnableTimeoutCounter
   - HAL_FDCAN_DisableTimeoutCounter
   - HAL_FDCAN_ConfigTxDelayCompensation
   - HAL_FDCAN_EnableTxDelayCompensation
   - HAL_FDCAN_DisableTxDelayCompensation
   - HAL_FDCAN_EnableISOMode
   - HAL_FDCAN_DisableISOMode
   - HAL_FDCAN_EnableEdgeFiltering
   - HAL_FDCAN_DisableEdgeFiltering
   - HAL_FDCAN_TT_ConfigOperation
   - HAL_FDCAN_TT_ConfigReferenceMessage
   - HAL_FDCAN_TT_ConfigTrigger
3. Start the FDCAN module using HAL_FDCAN_Start function. At this level the node is active on the bus: it can send and receive messages.
4. The following Tx control functions can only be called when the FDCAN module is started:
   - HAL_FDCAN_AddMessageToTxFifoQ
   - HAL_FDCAN_EnableTxBufferRequest
   - HAL_FDCAN_AbortTxRequest
5. After having submitted a Tx request in Tx Fifo or Queue, it is possible to get Tx buffer location used to place the Tx request thanks to HAL_FDCAN_GetLatestTxFifoQRequestBuffer API. It is then possible to abort later on the corresponding Tx Request using HAL_FDCAN_AbortTxRequest API.
6. When a message is received into the FDCAN message RAM, it can be retrieved using the HAL_FDCAN_GetRxMessage function.
7. Calling the HAL_FDCAN_Stop function stops the FDCAN module by entering it to initialization mode and re-enabling access to configuration registers through the configuration functions listed here above.
8. All other control functions can be called any time after initialization phase, no matter if the FDCAN module is started or stopped.

Polling mode operation

1. Reception and transmission states can be monitored via the following functions:
   - HAL_FDCAN_IsRxBufferMessageAvailable
   - HAL_FDCAN_IsTxBufferMessagePending
   - HAL_FDCAN_GetRxFifoFillLevel
   - HAL_FDCAN_GetTxFifoFreeLevel

Interrupt mode operation

1. There are two interrupt lines: line 0 and 1. By default, all interrupts are assigned to line 0. Interrupt lines can be configured using HAL_FDCAN_ConfigInterruptLines function.
2. Notifications are activated using HAL_FDCAN_ActivateNotification function. Then, the process can be controlled through one of the available user callbacks: HAL_FDCAN_xxxCallback.

Callback registration

25.2.2 Detailed description of functions

HAL_FDCAN_Init

Function name

HAL_StatusTypeDef HAL_FDCAN_Init (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_DeInit

Function name

HAL_StatusTypeDef HAL_FDCAN_DeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_MspInit

Function name

void HAL_FDCAN_MspInit (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_MspDeInit

Function name

void HAL_FDCAN_MspDeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_EnterPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnterPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ExitPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID, pFDCAN_CallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID)

Function description

HAL_FDCAN_RegisterClockCalibrationCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterClockCalibrationCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_ClockCalibrationCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterClockCalibrationCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterClockCalibrationCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxEventFifoCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo0CallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo1CallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferCompleteCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferAbortCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_ErrorStatusCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterTTScheduleSyncCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTScheduleSyncCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_ScheduleSyncCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterTTScheduleSyncCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTScheduleSyncCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterTTTimeMarkCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTTimeMarkCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_TimeMarkCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterTTTimeMarkCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTTimeMarkCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterTTStopWatchCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTStopWatchCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_StopWatchCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterTTStopWatchCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTStopWatchCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_RegisterTTGlobalTimeCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTTGlobalTimeCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TT_GlobalTimeCallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterTTGlobalTimeCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTTGlobalTimeCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ConfigClockCalibration

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigClockCalibration (FDCAN_HandleTypeDef * hfdcan, const FDCAN_ClkCalUnitTypeDef * sCcuConfig)

Function description

HAL_FDCAN_GetClockCalibrationState

Function name

uint32_t HAL_FDCAN_GetClockCalibrationState (const FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ResetClockCalibrationState

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetClockCalibrationState (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_GetClockCalibrationCounter

Function name

uint32_t HAL_FDCAN_GetClockCalibrationCounter (const FDCAN_HandleTypeDef * hfdcan, uint32_t Counter)

Function description

HAL_FDCAN_ConfigFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigFilter (FDCAN_HandleTypeDef * hfdcan, const FDCAN_FilterTypeDef * sFilterConfig)

Function description

HAL_FDCAN_ConfigGlobalFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigGlobalFilter (FDCAN_HandleTypeDef * hfdcan, uint32_t NonMatchingStd, uint32_t NonMatchingExt, uint32_t RejectRemoteStd, uint32_t RejectRemoteExt)

Function description

HAL_FDCAN_ConfigExtendedIdMask

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigExtendedIdMask (FDCAN_HandleTypeDef * hfdcan, uint32_t Mask)

Function description

HAL_FDCAN_ConfigRxFifoOverwrite

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRxFifoOverwrite (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo, uint32_t OperationMode)

Function description

HAL_FDCAN_ConfigFifoWatermark

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigFifoWatermark (FDCAN_HandleTypeDef * hfdcan, uint32_t FIFO, uint32_t Watermark)

Function description

HAL_FDCAN_ConfigRamWatchdog

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRamWatchdog (FDCAN_HandleTypeDef * hfdcan, uint32_t CounterStartValue)

Function description

HAL_FDCAN_ConfigTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampPrescaler)

Function description

HAL_FDCAN_EnableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampOperation)

Function description

HAL_FDCAN_DisableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_GetTimestampCounter

Function name

uint16_t HAL_FDCAN_GetTimestampCounter (const FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ResetTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ConfigTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimeoutCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimeoutOperation, uint32_t TimeoutPeriod)

Function description

HAL_FDCAN_EnableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_DisableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_GetTimeoutCounter

Function name

uint16_t HAL_FDCAN_GetTimeoutCounter (const FDCAN_HandleTypeDef * hfdcan)

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_DisableTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_EnableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_DisableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_EnableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_DisableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_Start

Function name

HAL_StatusTypeDef HAL_FDCAN_Start (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_Stop

Function name

HAL_StatusTypeDef HAL_FDCAN_Stop (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_AddMessageToTxFifoQ

Function name

HAL_StatusTypeDef HAL_FDCAN_AddMessageToTxFifoQ (FDCAN_HandleTypeDef * hfdcan, const FDCAN_TxHeaderTypeDef * pTxHeader, const uint8_t * pTxData)

Function description

HAL_FDCAN_AddMessageToTxBuffer

Function name

HAL_StatusTypeDef HAL_FDCAN_AddMessageToTxBuffer (FDCAN_HandleTypeDef * hfdcan, const FDCAN_TxHeaderTypeDef * pTxHeader, const uint8_t * pTxData, uint32_t BufferIndex)

Function description

HAL_FDCAN_EnableTxBufferRequest

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTxBufferRequest (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndex)

Function description

HAL_FDCAN_GetLatestTxFifoQRequestBuffer

Function name

uint32_t HAL_FDCAN_GetLatestTxFifoQRequestBuffer (const FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_AbortTxRequest

Function name

HAL_StatusTypeDef HAL_FDCAN_AbortTxRequest (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndex)

Function description

HAL_FDCAN_GetRxMessage

Function name

HAL_StatusTypeDef HAL_FDCAN_GetRxMessage (FDCAN_HandleTypeDef * hfdcan, uint32_t RxLocation, FDCAN_RxHeaderTypeDef * pRxHeader, uint8_t * pRxData)

Function description

HAL_FDCAN_GetTxEvent

Function name

HAL_StatusTypeDef HAL_FDCAN_GetTxEvent (FDCAN_HandleTypeDef * hfdcan, FDCAN_TxEventFifoTypeDef * pTxEvent)

Function description

HAL_FDCAN_GetHighPriorityMessageStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetHighPriorityMessageStatus (const FDCAN_HandleTypeDef * hfdcan, FDCAN_HpMsgStatusTypeDef * HpMsgStatus)

Function description

HAL_FDCAN_GetProtocolStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetProtocolStatus (const FDCAN_HandleTypeDef * hfdcan, FDCAN_ProtocolStatusTypeDef * ProtocolStatus)

Function description

HAL_FDCAN_GetErrorCounters

Function name

HAL_StatusTypeDef HAL_FDCAN_GetErrorCounters (const FDCAN_HandleTypeDef * hfdcan, FDCAN_ErrorCountersTypeDef * ErrorCounters)

Function description

HAL_FDCAN_IsRxBufferMessageAvailable

Function name

uint32_t HAL_FDCAN_IsRxBufferMessageAvailable (FDCAN_HandleTypeDef * hfdcan, uint32_t RxBufferIndex)

Function description

HAL_FDCAN_IsTxBufferMessagePending

Function name

uint32_t HAL_FDCAN_IsTxBufferMessagePending (const FDCAN_HandleTypeDef * hfdcan, uint32_t TxBufferIndex)

Function description

HAL_FDCAN_GetRxFifoFillLevel

Function name

uint32_t HAL_FDCAN_GetRxFifoFillLevel (const FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo)

Function description

HAL_FDCAN_GetTxFifoFreeLevel

Function name

uint32_t HAL_FDCAN_GetTxFifoFreeLevel (const FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_IsRestrictedOperationMode

Function name

uint32_t HAL_FDCAN_IsRestrictedOperationMode (const FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ExitRestrictedOperationMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitRestrictedOperationMode (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_ConfigOperation

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigOperation (FDCAN_HandleTypeDef * hfdcan, const FDCAN_TT_ConfigTypeDef * pTTParams)

Function description

HAL_FDCAN_TT_ConfigReferenceMessage

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigReferenceMessage (FDCAN_HandleTypeDef * hfdcan, uint32_t IdType, uint32_t Identifier, uint32_t Payload)

Function description

HAL_FDCAN_TT_ConfigTrigger

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigTrigger (FDCAN_HandleTypeDef * hfdcan, const FDCAN_TriggerTypeDef * sTriggerConfig)

Function description

HAL_FDCAN_TT_SetGlobalTime

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetGlobalTime (FDCAN_HandleTypeDef * hfdcan, uint32_t TimePreset)

Function description

HAL_FDCAN_TT_SetClockSynchronization

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetClockSynchronization (FDCAN_HandleTypeDef * hfdcan, uint32_t NewTURNumerator)

Function description

HAL_FDCAN_TT_ConfigStopWatch

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigStopWatch (FDCAN_HandleTypeDef * hfdcan, uint32_t Source, uint32_t Polarity)

Function description

HAL_FDCAN_TT_ConfigRegisterTimeMark

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigRegisterTimeMark (FDCAN_HandleTypeDef * hfdcan, uint32_t TimeMarkSource, uint32_t TimeMarkValue, uint32_t RepeatFactor, uint32_t StartCycle)

Function description

HAL_FDCAN_TT_EnableRegisterTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableRegisterTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_DisableRegisterTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableRegisterTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_EnableTriggerTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableTriggerTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_DisableTriggerTimeMarkPulse

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableTriggerTimeMarkPulse (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_EnableHardwareGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableHardwareGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_DisableHardwareGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableHardwareGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_EnableTimeMarkGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableTimeMarkGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_DisableTimeMarkGapControl

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableTimeMarkGapControl (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_SetNextIsGap

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetNextIsGap (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_SetEndOfGap

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_SetEndOfGap (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_ConfigExternalSyncPhase

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigExternalSyncPhase (FDCAN_HandleTypeDef * hfdcan, uint32_t TargetPhase)

Function description

HAL_FDCAN_TT_EnableExternalSynchronization

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_EnableExternalSynchronization (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_DisableExternalSynchronization

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DisableExternalSynchronization (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TT_GetOperationStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_GetOperationStatus (const FDCAN_HandleTypeDef * hfdcan, FDCAN_TTOperationStatusTypeDef * TTOpStatus)

Function description

HAL_FDCAN_ConfigInterruptLines

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigInterruptLines (FDCAN_HandleTypeDef * hfdcan, uint32_t ITList, uint32_t InterruptLine)

Function description

HAL_FDCAN_TT_ConfigInterruptLines

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ConfigInterruptLines (FDCAN_HandleTypeDef * hfdcan, uint32_t TTITList, uint32_t InterruptLine)

Function description

HAL_FDCAN_ActivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_ActivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t ActiveITs, uint32_t BufferIndexes)

Function description

HAL_FDCAN_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_DeactivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t InactiveITs)

Function description

HAL_FDCAN_TT_ActivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_ActivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t ActiveTTITs)

Function description

HAL_FDCAN_TT_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_TT_DeactivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t InactiveTTITs)

Function description

HAL_FDCAN_IRQHandler

Function name

void HAL_FDCAN_IRQHandler (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ClockCalibrationCallback

Function name

void HAL_FDCAN_ClockCalibrationCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t ClkCalibrationITs)

Function description

HAL_FDCAN_TxEventFifoCallback

Function name

void HAL_FDCAN_TxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TxEventFifoITs)

Function description

HAL_FDCAN_RxFifo0Callback

Function name

void HAL_FDCAN_RxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo0ITs)

Function description

HAL_FDCAN_RxFifo1Callback

Function name

void HAL_FDCAN_RxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo1ITs)

Function description

HAL_FDCAN_TxFifoEmptyCallback

Function name

void HAL_FDCAN_TxFifoEmptyCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TxBufferCompleteCallback

Function name

void HAL_FDCAN_TxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

HAL_FDCAN_TxBufferAbortCallback

Function name

void HAL_FDCAN_TxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

HAL_FDCAN_RxBufferNewMessageCallback

Function name

void HAL_FDCAN_RxBufferNewMessageCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_HighPriorityMessageCallback

Function name

void HAL_FDCAN_HighPriorityMessageCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TimestampWraparoundCallback

Function name

void HAL_FDCAN_TimestampWraparoundCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_TimeoutOccurredCallback

Function name

void HAL_FDCAN_TimeoutOccurredCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ErrorCallback

Function name

void HAL_FDCAN_ErrorCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_ErrorStatusCallback

Function name

void HAL_FDCAN_ErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t ErrorStatusITs)

Function description

HAL_FDCAN_TT_ScheduleSyncCallback

Function name

void HAL_FDCAN_TT_ScheduleSyncCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TTSchedSyncITs)

Function description

HAL_FDCAN_TT_TimeMarkCallback

Function name

void HAL_FDCAN_TT_TimeMarkCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TTTimeMarkITs)

Function description

HAL_FDCAN_TT_StopWatchCallback

Function name

void HAL_FDCAN_TT_StopWatchCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t SWTime, uint32_t SWCycleCount)

Function description

HAL_FDCAN_TT_GlobalTimeCallback

Function name

void HAL_FDCAN_TT_GlobalTimeCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TTGlobTimeIts)

Function description

HAL_FDCAN_GetError

Function name

uint32_t HAL_FDCAN_GetError (const FDCAN_HandleTypeDef * hfdcan)

Function description

HAL_FDCAN_GetState

Function name

HAL_FDCAN_StateTypeDef HAL_FDCAN_GetState (const FDCAN_HandleTypeDef * hfdcan)

Function description

25.3 FDCAN Firmware driver defines

The following section lists the various define and macros of the module.

25.3.1 FDCAN

FDCAN

FDCAN Bit Rate Switching

FDCAN_BRS_OFF

FDCAN frames transmitted/received without bit rate switching

FDCAN_BRS_ON

FDCAN frames transmitted/received with bit rate switching

FDCAN Calibration Counter

FDCAN_CALIB_TIME_QUANTA_COUNTER

Time Quanta Counter

FDCAN_CALIB_CLOCK_PERIOD_COUNTER

Oscillator Clock Period Counter

FDCAN_CALIB_WATCHDOG_COUNTER

Calibration Watchdog Counter

FDCAN Calibration Field Length

FDCAN_CALIB_FIELD_LENGTH_32

Calibration field length is 32 bits

FDCAN_CALIB_FIELD_LENGTH_64

Calibration field length is 64 bits

FDCAN Calibration State

FDCAN_CLOCK_NOT_CALIBRATED

Clock not calibrated

FDCAN_CLOCK_BASIC_CALIBRATED

Clock basic calibrated

FDCAN_CLOCK_PRECISION_CALIBRATED

Clock precision calibrated

FDCAN Clock Calibration

FDCAN_CLOCK_CALIBRATION_DISABLE

Disable Clock Calibration

FDCAN_CLOCK_CALIBRATION_ENABLE

Enable Clock Calibration

Clock Calibration Interrupts

FDCAN_IT_CALIB_STATE_CHANGED

Clock calibration state changed

FDCAN_IT_CALIB_WATCHDOG_EVENT

Clock calibration watchdog event occurred

FDCAN Clock Divider

FDCAN_CLOCK_DIV1

Divide kernel clock by 1

FDCAN_CLOCK_DIV2

Divide kernel clock by 2

FDCAN_CLOCK_DIV4

Divide kernel clock by 4

FDCAN_CLOCK_DIV6

Divide kernel clock by 6

FDCAN_CLOCK_DIV8

Divide kernel clock by 8

FDCAN_CLOCK_DIV10

Divide kernel clock by 10

FDCAN_CLOCK_DIV12

Divide kernel clock by 12

FDCAN_CLOCK_DIV14

Divide kernel clock by 14

FDCAN_CLOCK_DIV16

Divide kernel clock by 16

FDCAN_CLOCK_DIV18

Divide kernel clock by 18

FDCAN_CLOCK_DIV20

Divide kernel clock by 20

FDCAN_CLOCK_DIV22

Divide kernel clock by 22

FDCAN_CLOCK_DIV24

Divide kernel clock by 24

FDCAN_CLOCK_DIV26

Divide kernel clock by 26

FDCAN_CLOCK_DIV28

Divide kernel clock by 28

FDCAN_CLOCK_DIV30

Divide kernel clock by 30

FDCAN communication state

FDCAN_COM_STATE_SYNC

Node is synchronizing on CAN communication

FDCAN_COM_STATE_IDLE

Node is neither receiver nor transmitter

FDCAN_COM_STATE_RX

Node is operating as receiver

FDCAN_COM_STATE_TX

Node is operating as transmitter

FDCAN Counter Interrupts

FDCAN_IT_TIMESTAMP_WRAPAROUND

Timestamp counter wrapped around

FDCAN_IT_TIMEOUT_OCCURRED

Timeout reached

FDCAN Data Field Size

FDCAN_DATA_BYTES_8

8 bytes data field

FDCAN_DATA_BYTES_12

12 bytes data field

FDCAN_DATA_BYTES_16

16 bytes data field

FDCAN_DATA_BYTES_20

20 bytes data field

FDCAN_DATA_BYTES_24

24 bytes data field

FDCAN_DATA_BYTES_32

32 bytes data field

FDCAN_DATA_BYTES_48

48 bytes data field

FDCAN_DATA_BYTES_64

64 bytes data field

FDCAN Data Length Code

FDCAN_DLC_BYTES_0

0 bytes data field

FDCAN_DLC_BYTES_1

1 bytes data field

FDCAN_DLC_BYTES_2

2 bytes data field

FDCAN_DLC_BYTES_3

3 bytes data field

FDCAN_DLC_BYTES_4

4 bytes data field

FDCAN_DLC_BYTES_5

5 bytes data field

FDCAN_DLC_BYTES_6

6 bytes data field

FDCAN_DLC_BYTES_7

7 bytes data field

FDCAN_DLC_BYTES_8

8 bytes data field

FDCAN_DLC_BYTES_12

12 bytes data field

FDCAN_DLC_BYTES_16

16 bytes data field

FDCAN_DLC_BYTES_20

20 bytes data field

FDCAN_DLC_BYTES_24

24 bytes data field

FDCAN_DLC_BYTES_32

32 bytes data field

FDCAN_DLC_BYTES_48

48 bytes data field

FDCAN_DLC_BYTES_64

64 bytes data field

FDCAN Error Interrupts

FDCAN_IT_RAM_ACCESS_FAILURE

Message RAM access failure occurred

FDCAN_IT_ERROR_LOGGING_OVERFLOW

Overflow of FDCAN Error Logging Counter occurred

FDCAN_IT_RAM_WATCHDOG

Message RAM Watchdog event due to missing READY

FDCAN_IT_ARB_PROTOCOL_ERROR

Protocol error in arbitration phase detected

FDCAN_IT_DATA_PROTOCOL_ERROR

Protocol error in data phase detected

FDCAN_IT_RESERVED_ADDRESS_ACCESS

Access to reserved address occurred

FDCAN Error State Indicator

FDCAN_ESI_ACTIVE

Transmitting node is error active

FDCAN_ESI_PASSIVE

Transmitting node is error passive

FDCAN Error Status Interrupts

FDCAN_IT_ERROR_PASSIVE

Error_Passive status changed

FDCAN_IT_ERROR_WARNING

Error_Warning status changed

FDCAN_IT_BUS_OFF

Bus_Off status changed

FDCAN Event Type

FDCAN_TX_EVENT

Tx event

FDCAN_TX_IN_SPITE_OF_ABORT

Transmission in spite of cancellation

FDCAN Exported Macros

__HAL_FDCAN_RESET_HANDLE_STATE

Description:

- Reset FDCAN handle state.

Parameters:

- __HANDLE__: FDCAN handle.

Return value:

- None

__HAL_FDCAN_ENABLE_IT

Description:

- Enable the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_DISABLE_IT

Description:

- Disable the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_GET_IT

Description:

- Check whether the specified FDCAN interrupt is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be one of
  - FDCAN_Interrupts

Return value:

- ITStatus

__HAL_FDCAN_CLEAR_IT

Description:

- Clear the specified FDCAN interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the interrupts to clear. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:

- None

__HAL_FDCAN_GET_FLAG

Description:

- Check whether the specified FDCAN flag is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: FDCAN flag. This parameter can be one of
  - FDCAN_flags

Return value:

- FlagStatus

__HAL_FDCAN_CLEAR_FLAG

Description:

- Clear the specified FDCAN flags.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: specifies the flags to clear. This parameter can be any combination of
  - FDCAN_flags

Return value:

- None

__HAL_FDCAN_GET_IT_SOURCE

Description:

- Check if the specified FDCAN interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the FDCAN interrupt source to check. This parameter can be a value of
  - FDCAN_Interrupts

Return value:

- ITStatus

__HAL_FDCAN_TT_ENABLE_IT

Description:

- Enable the specified FDCAN TT interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN TT interrupt. This parameter can be any combination of
  - FDCAN_TTInterrupts

Return value:

- None

__HAL_FDCAN_TT_DISABLE_IT

Description:

- Disable the specified FDCAN TT interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN TT interrupt. This parameter can be any combination of
  - FDCAN_TTInterrupts

Return value:

- None

__HAL_FDCAN_TT_GET_IT

Description:

- Check whether the specified FDCAN TT interrupt is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN TT interrupt. This parameter can be one of
  - FDCAN_TTInterrupts

Return value:

- ITStatus

__HAL_FDCAN_TT_CLEAR_IT

Description:

- Clear the specified FDCAN TT interrupts.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the TT interrupts to clear. This parameter can be any combination of
  - FDCAN_TTInterrupts

Return value:

- None

__HAL_FDCAN_TT_GET_FLAG

Description:

- Check whether the specified FDCAN TT flag is set or not.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: FDCAN TT flag. This parameter can be one of
  - FDCAN_TTflags

Return value:

- FlagStatus

__HAL_FDCAN_TT_CLEAR_FLAG

Description:

- Clear the specified FDCAN TT flags.

Parameters:

- __HANDLE__: FDCAN handle.
- __FLAG__: specifies the TT flags to clear. This parameter can be any combination of
  - FDCAN_TTflags

Return value:

- None

__HAL_FDCAN_TT_GET_IT_SOURCE

Description:

- Check if the specified FDCAN TT interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the FDCAN TT interrupt source to check. This parameter can be a value of
  - FDCAN_TTInterrupts

Return value:

- ITStatus

FDCAN FIFO watermark

FDCAN_CFG_TX_EVENT_FIFO

Tx event FIFO

FDCAN_CFG_RX_FIFO0

Rx FIFO0

FDCAN_CFG_RX_FIFO1

Rx FIFO1

FDCAN Filter Configuration

FDCAN_FILTER_DISABLE

Disable filter element

FDCAN_FILTER_TO_RXFIFO0

Store in Rx FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1

Store in Rx FIFO 1 if filter matches

FDCAN_FILTER_REJECT

Reject ID if filter matches

FDCAN_FILTER_HP

Set high priority if filter matches

FDCAN_FILTER_TO_RXFIFO0_HP

Set high priority and store in FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1_HP

Set high priority and store in FIFO 1 if filter matches

FDCAN_FILTER_TO_RXBUFFER

Store into Rx Buffer, configuration of FilterType ignored

FDCAN Filter Type

FDCAN_FILTER_RANGE

Range filter from FilterID1 to FilterID2

FDCAN_FILTER_DUAL

Dual ID filter for FilterID1 or FilterID2

FDCAN_FILTER_MASK

Classic filter: FilterID1 = filter, FilterID2 = mask

FDCAN_FILTER_RANGE_NO_EIDM

Range filter from FilterID1 to FilterID2, EIDM mask not applied

FDCAN Flags

FDCAN_FLAG_TX_COMPLETE

Transmission Completed

FDCAN_FLAG_TX_ABORT_COMPLETE

Transmission Cancellation Finished

FDCAN_FLAG_TX_FIFO_EMPTY

Tx FIFO Empty

FDCAN_FLAG_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN_FLAG_RX_BUFFER_NEW_MESSAGE

At least one received message stored into a Rx Buffer

FDCAN_FLAG_TX_EVT_FIFO_ELT_LOST

Tx Event FIFO element lost

FDCAN_FLAG_TX_EVT_FIFO_FULL

Tx Event FIFO full

FDCAN_FLAG_TX_EVT_FIFO_WATERMARK

Tx Event FIFO fill level reached watermark

FDCAN_FLAG_TX_EVT_FIFO_NEW_DATA

Tx Handler wrote Tx Event FIFO element

FDCAN_FLAG_RX_FIFO0_MESSAGE_LOST

Rx FIFO 0 message lost

FDCAN_FLAG_RX_FIFO0_FULL

Rx FIFO 0 full

FDCAN_FLAG_RX_FIFO0_WATERMARK

Rx FIFO 0 fill level reached watermark

FDCAN_FLAG_RX_FIFO0_NEW_MESSAGE

New message written to Rx FIFO 0

FDCAN_FLAG_RX_FIFO1_MESSAGE_LOST

Rx FIFO 1 message lost

FDCAN_FLAG_RX_FIFO1_FULL

Rx FIFO 1 full

FDCAN_FLAG_RX_FIFO1_WATERMARK

Rx FIFO 1 fill level reached watermark

FDCAN_FLAG_RX_FIFO1_NEW_MESSAGE

New message written to Rx FIFO 1

FDCAN_FLAG_RAM_ACCESS_FAILURE

Message RAM access failure occurred

FDCAN_FLAG_ERROR_LOGGING_OVERFLOW

Overflow of FDCAN Error Logging Counter occurred

FDCAN_FLAG_ERROR_PASSIVE

Error_Passive status changed

FDCAN_FLAG_ERROR_WARNING

Error_Warning status changed

FDCAN_FLAG_BUS_OFF

Bus_Off status changed

FDCAN_FLAG_RAM_WATCHDOG

Message RAM Watchdog event due to missing READY

FDCAN_FLAG_ARB_PROTOCOL_ERROR

Protocol error in arbitration phase detected

FDCAN_FLAG_DATA_PROTOCOL_ERROR

Protocol error in data phase detected

FDCAN_FLAG_RESERVED_ADDRESS_ACCESS

Access to reserved address occurred

FDCAN_FLAG_TIMESTAMP_WRAPAROUND

Timestamp counter wrapped around

FDCAN_FLAG_TIMEOUT_OCCURRED

Timeout reached

FDCAN_FLAG_CALIB_STATE_CHANGED

Clock calibration state changed

FDCAN_FLAG_CALIB_WATCHDOG_EVENT

Clock calibration watchdog event occurred

FDCAN format

FDCAN_CLASSIC_CAN

Frame transmitted/received in Classic CAN format

FDCAN_FD_CAN

Frame transmitted/received in FDCAN format

FDCAN Frame Format

FDCAN_FRAME_CLASSIC

Classic mode

FDCAN_FRAME_FD_NO_BRS

FD mode without BitRate Switching

FDCAN_FRAME_FD_BRS

FD mode with BitRate Switching

FDCAN Frame Type

FDCAN_DATA_FRAME

Data frame

FDCAN_REMOTE_FRAME

Remote frame

FDCAN High Priority Message Storage

FDCAN_HP_STORAGE_NO_FIFO

No FIFO selected

FDCAN_HP_STORAGE_MSG_LOST

FIFO message lost

FDCAN_HP_STORAGE_RXFIFO0

Message stored in FIFO 0

FDCAN_HP_STORAGE_RXFIFO1

Message stored in FIFO 1

FDCAN ID Type

FDCAN_STANDARD_ID

Standard ID element

FDCAN_EXTENDED_ID

Extended ID element

FDCAN interrupt line

FDCAN_INTERRUPT_LINE0

Interrupt Line 0

FDCAN_INTERRUPT_LINE1

Interrupt Line 1

FDCAN non-matching frames

FDCAN_ACCEPT_IN_RX_FIFO0

Accept in Rx FIFO 0

FDCAN_ACCEPT_IN_RX_FIFO1

Accept in Rx FIFO 1

FDCAN_REJECT

Reject

FDCAN Operating Mode

FDCAN_MODE_NORMAL

Normal mode

FDCAN_MODE_RESTRICTED_OPERATION

Restricted Operation mode

FDCAN_MODE_BUS_MONITORING

Bus Monitoring mode

FDCAN_MODE_INTERNAL_LOOPBACK

Internal LoopBack mode

FDCAN_MODE_EXTERNAL_LOOPBACK

External LoopBack mode

FDCAN Operation Mode

FDCAN_TT_COMMUNICATION_LEVEL1

Time triggered communication, level 1

FDCAN_TT_COMMUNICATION_LEVEL2

Time triggered communication, level 2

FDCAN_TT_COMMUNICATION_LEVEL0

Time triggered communication, level 0

FDCAN protocol error code

FDCAN_PROTOCOL_ERROR_NONE

No error occurred

FDCAN_PROTOCOL_ERROR_STUFF

Stuff error

FDCAN_PROTOCOL_ERROR_FORM

Form error

FDCAN_PROTOCOL_ERROR_ACK

Acknowledge error

FDCAN_PROTOCOL_ERROR_BIT1

Bit 1 (recessive) error

FDCAN_PROTOCOL_ERROR_BIT0

Bit 0 (dominant) error

FDCAN_PROTOCOL_ERROR_CRC

CRC check sum error

FDCAN_PROTOCOL_ERROR_NO_CHANGE

No change since last read

FDCAN reject remote frames

FDCAN_FILTER_REMOTE

Filter remote frames

FDCAN_REJECT_REMOTE

Reject all remote frames

FDCAN Rx FIFO 0 Interrupts

FDCAN_IT_RX_FIFO0_MESSAGE_LOST

Rx FIFO 0 message lost

FDCAN_IT_RX_FIFO0_FULL

Rx FIFO 0 full

FDCAN_IT_RX_FIFO0_WATERMARK

Rx FIFO 0 fill level reached watermark

FDCAN_IT_RX_FIFO0_NEW_MESSAGE

New message written to Rx FIFO 0

FDCAN Rx FIFO 1 Interrupts

FDCAN_IT_RX_FIFO1_MESSAGE_LOST

Rx FIFO 1 message lost

FDCAN_IT_RX_FIFO1_FULL

Rx FIFO 1 full

FDCAN_IT_RX_FIFO1_WATERMARK

Rx FIFO 1 fill level reached watermark

FDCAN_IT_RX_FIFO1_NEW_MESSAGE

New message written to Rx FIFO 1

FDCAN FIFO operation mode

FDCAN_RX_FIFO_BLOCKING

Rx FIFO blocking mode

FDCAN_RX_FIFO_OVERWRITE

Rx FIFO overwrite mode

FDCAN Rx Interrupts

FDCAN_IT_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN_IT_RX_BUFFER_NEW_MESSAGE

At least one received message stored into a Rx Buffer

FDCAN Rx Location

FDCAN_RX_FIFO0

Get received message from Rx FIFO 0

FDCAN_RX_FIFO1

Get received message from Rx FIFO 1

FDCAN_RX_BUFFER0

Get received message from Rx Buffer 0

FDCAN_RX_BUFFER1

Get received message from Rx Buffer 1

FDCAN_RX_BUFFER2

Get received message from Rx Buffer 2

FDCAN_RX_BUFFER3

Get received message from Rx Buffer 3

FDCAN_RX_BUFFER4

Get received message from Rx Buffer 4

FDCAN_RX_BUFFER5

Get received message from Rx Buffer 5

FDCAN_RX_BUFFER6

Get received message from Rx Buffer 6

FDCAN_RX_BUFFER7

Get received message from Rx Buffer 7

FDCAN_RX_BUFFER8

Get received message from Rx Buffer 8

FDCAN_RX_BUFFER9

Get received message from Rx Buffer 9

FDCAN_RX_BUFFER10

Get received message from Rx Buffer 10

FDCAN_RX_BUFFER11

Get received message from Rx Buffer 11

FDCAN_RX_BUFFER12

Get received message from Rx Buffer 12

FDCAN_RX_BUFFER13

Get received message from Rx Buffer 13

FDCAN_RX_BUFFER14

Get received message from Rx Buffer 14

FDCAN_RX_BUFFER15

Get received message from Rx Buffer 15

FDCAN_RX_BUFFER16

Get received message from Rx Buffer 16

FDCAN_RX_BUFFER17

Get received message from Rx Buffer 17

FDCAN_RX_BUFFER18

Get received message from Rx Buffer 18

FDCAN_RX_BUFFER19

Get received message from Rx Buffer 19

FDCAN_RX_BUFFER20

Get received message from Rx Buffer 20

FDCAN_RX_BUFFER21

Get received message from Rx Buffer 21

FDCAN_RX_BUFFER22

Get received message from Rx Buffer 22

FDCAN_RX_BUFFER23

Get received message from Rx Buffer 23

FDCAN_RX_BUFFER24

Get received message from Rx Buffer 24

FDCAN_RX_BUFFER25

Get received message from Rx Buffer 25

FDCAN_RX_BUFFER26

Get received message from Rx Buffer 26

FDCAN_RX_BUFFER27

Get received message from Rx Buffer 27

FDCAN_RX_BUFFER28

Get received message from Rx Buffer 28

FDCAN_RX_BUFFER29

Get received message from Rx Buffer 29

FDCAN_RX_BUFFER30

Get received message from Rx Buffer 30

FDCAN_RX_BUFFER31

Get received message from Rx Buffer 31

FDCAN_RX_BUFFER32

Get received message from Rx Buffer 32

FDCAN_RX_BUFFER33

Get received message from Rx Buffer 33

FDCAN_RX_BUFFER34

Get received message from Rx Buffer 34

FDCAN_RX_BUFFER35

Get received message from Rx Buffer 35

FDCAN_RX_BUFFER36

Get received message from Rx Buffer 36

FDCAN_RX_BUFFER37

Get received message from Rx Buffer 37

FDCAN_RX_BUFFER38

Get received message from Rx Buffer 38

FDCAN_RX_BUFFER39

Get received message from Rx Buffer 39

FDCAN_RX_BUFFER40

Get received message from Rx Buffer 40

FDCAN_RX_BUFFER41

Get received message from Rx Buffer 41

FDCAN_RX_BUFFER42

Get received message from Rx Buffer 42

FDCAN_RX_BUFFER43

Get received message from Rx Buffer 43

FDCAN_RX_BUFFER44

Get received message from Rx Buffer 44

FDCAN_RX_BUFFER45

Get received message from Rx Buffer 45

FDCAN_RX_BUFFER46

Get received message from Rx Buffer 46

FDCAN_RX_BUFFER47

Get received message from Rx Buffer 47

FDCAN_RX_BUFFER48

Get received message from Rx Buffer 48

FDCAN_RX_BUFFER49

Get received message from Rx Buffer 49

FDCAN_RX_BUFFER50

Get received message from Rx Buffer 50

FDCAN_RX_BUFFER51

Get received message from Rx Buffer 51

FDCAN_RX_BUFFER52

Get received message from Rx Buffer 52

FDCAN_RX_BUFFER53

Get received message from Rx Buffer 53

FDCAN_RX_BUFFER54

Get received message from Rx Buffer 54

FDCAN_RX_BUFFER55

Get received message from Rx Buffer 55

FDCAN_RX_BUFFER56

Get received message from Rx Buffer 56

FDCAN_RX_BUFFER57

Get received message from Rx Buffer 57

FDCAN_RX_BUFFER58

Get received message from Rx Buffer 58

FDCAN_RX_BUFFER59

Get received message from Rx Buffer 59

FDCAN_RX_BUFFER60

Get received message from Rx Buffer 60

FDCAN_RX_BUFFER61

Get received message from Rx Buffer 61

FDCAN_RX_BUFFER62

Get received message from Rx Buffer 62

FDCAN_RX_BUFFER63

Get received message from Rx Buffer 63

FDCAN timeout operation

FDCAN_TIMEOUT_CONTINUOUS

Timeout continuous operation

FDCAN_TIMEOUT_TX_EVENT_FIFO

Timeout controlled by Tx Event FIFO

FDCAN_TIMEOUT_RX_FIFO0

Timeout controlled by Rx FIFO 0

FDCAN_TIMEOUT_RX_FIFO1

Timeout controlled by Rx FIFO 1

FDCAN timestamp

FDCAN_TIMESTAMP_INTERNAL

Timestamp counter value incremented according to TCP

FDCAN_TIMESTAMP_EXTERNAL

External timestamp counter value used

FDCAN timestamp prescaler

FDCAN_TIMESTAMP_PRESC_1

Timestamp counter time unit in equal to CAN bit time

FDCAN_TIMESTAMP_PRESC_2

Timestamp counter time unit in equal to CAN bit time multiplied by 2

FDCAN_TIMESTAMP_PRESC_3

Timestamp counter time unit in equal to CAN bit time multiplied by 3

FDCAN_TIMESTAMP_PRESC_4

Timestamp counter time unit in equal to CAN bit time multiplied by 4

FDCAN_TIMESTAMP_PRESC_5

Timestamp counter time unit in equal to CAN bit time multiplied by 5

FDCAN_TIMESTAMP_PRESC_6

Timestamp counter time unit in equal to CAN bit time multiplied by 6

FDCAN_TIMESTAMP_PRESC_7

Timestamp counter time unit in equal to CAN bit time multiplied by 7

FDCAN_TIMESTAMP_PRESC_8

Timestamp counter time unit in equal to CAN bit time multiplied by 8

FDCAN_TIMESTAMP_PRESC_9

Timestamp counter time unit in equal to CAN bit time multiplied by 9

FDCAN_TIMESTAMP_PRESC_10

Timestamp counter time unit in equal to CAN bit time multiplied by 10

FDCAN_TIMESTAMP_PRESC_11

Timestamp counter time unit in equal to CAN bit time multiplied by 11

FDCAN_TIMESTAMP_PRESC_12

Timestamp counter time unit in equal to CAN bit time multiplied by 12

FDCAN_TIMESTAMP_PRESC_13

Timestamp counter time unit in equal to CAN bit time multiplied by 13

FDCAN_TIMESTAMP_PRESC_14

Timestamp counter time unit in equal to CAN bit time multiplied by 14

FDCAN_TIMESTAMP_PRESC_15

Timestamp counter time unit in equal to CAN bit time multiplied by 15

FDCAN_TIMESTAMP_PRESC_16

Timestamp counter time unit in equal to CAN bit time multiplied by 16

FDCAN TT Disturbing Error Interrupts

FDCAN_TT_IT_GLOBAL_TIME_ERROR

Global Time Error

FDCAN_TT_IT_TX_COUNT_UNDERFLOW

Tx Count Underflow

FDCAN_TT_IT_TX_COUNT_OVERFLOW

Tx Count Overflow

FDCAN_TT_IT_SCHEDULING_ERROR_1

Scheduling Error 1

FDCAN_TT_IT_SCHEDULING_ERROR_2

Scheduling Error 2

FDCAN_TT_IT_ERROR_LEVEL_CHANGE

Error Level Changed

FDCAN TT Fatal Error Interrupts

FDCAN_TT_IT_INIT_WATCH_TRIGGER

Initialization Watch Trigger

FDCAN_TT_IT_WATCH_TRIGGER

Watch Trigger

FDCAN_TT_IT_APPLICATION_WATCHDOG

Application Watchdog

FDCAN_TT_IT_CONFIG_ERROR

Configuration Error

FDCAN TT Flags

FDCAN_TT_FLAG_BASIC_CYCLE_START

Start of Basic Cycle

FDCAN_TT_FLAG_MATRIX_CYCLE_START

Start of Matrix Cycle

FDCAN_TT_FLAG_SYNC_MODE_CHANGE

Change of Synchronization Mode

FDCAN_TT_FLAG_START_OF_GAP

Start of Gap

FDCAN_TT_FLAG_REG_TIME_MARK

Register Time Mark Interrupt

FDCAN_TT_FLAG_TRIG_TIME_MARK

Trigger Time Mark Event Internal

FDCAN_TT_FLAG_STOP_WATCH

Stop Watch Event

FDCAN_TT_FLAG_GLOBAL_TIME_WRAP

Global Time Wrap

FDCAN_TT_FLAG_GLOBAL_TIME_DISC

Global Time Discontinuity

FDCAN_TT_FLAG_GLOBAL_TIME_ERROR

Global Time Error

Start of Basic Cycle

FDCAN_TT_IT_MATRIX_CYCLE_START

Start of Matrix Cycle

FDCAN_TT_IT_SYNC_MODE_CHANGE

Change of Synchronization Mode

FDCAN_TT_IT_START_OF_GAP

Start of Gap

FDCAN TT Stop Watch Interrupt

FDCAN_TT_IT_STOP_WATCH

Stop Watch Event

FDCAN TT Time Mark Interrupts

FDCAN_TT_IT_REG_TIME_MARK

Register Time Mark Interrupt

FDCAN_TT_IT_TRIG_TIME_MARK

Trigger Time Mark Event Internal

FDCAN TT Automatic Clock Calibration

FDCAN_TT_AUTO_CLK_CALIB_DISABLE

Automatic clock calibration in Level 0,2 disabled

FDCAN_TT_AUTO_CLK_CALIB_ENABLE

Automatic clock calibration in Level 0,2 enabled

FDCAN TT Basic Cycle Number

FDCAN_TT_CYCLES_PER_MATRIX_1

1 Basic Cycle per Matrix

FDCAN_TT_CYCLES_PER_MATRIX_2

2 Basic Cycles per Matrix

FDCAN_TT_CYCLES_PER_MATRIX_4

4 Basic Cycles per Matrix

FDCAN_TT_CYCLES_PER_MATRIX_8

8 Basic Cycles per Matrix

FDCAN_TT_CYCLES_PER_MATRIX_16

16 Basic Cycles per Matrix

FDCAN_TT_CYCLES_PER_MATRIX_32

32 Basic Cycles per Matrix

FDCAN_TT_CYCLES_PER_MATRIX_64

64 Basic Cycles per Matrix

FDCAN TT Cycle Start Sync

FDCAN_TT_NO_SYNC_PULSE

No sync pulse

FDCAN_TT_SYNC_BASIC_CYCLE_START

Sync pulse at start of basic cycle

FDCAN_TT_SYNC_MATRIX_START

Sync pulse at start of matrix

FDCAN TT Error Level

FDCAN_TT_NO_ERROR

Severity 0 - No Error

FDCAN_TT_WARNING

Severity 1 - Warning

FDCAN_TT_ERROR

Severity 2 - Error

FDCAN_TT_SEVERE_ERROR

Severity 3 - Severe Error

FDCAN TT Event Trigger Polarity

FDCAN_TT_EVT_TRIG_POL_RISING

Rising edge trigger

FDCAN_TT_EVT_TRIG_POL_FALLING

Falling edge trigger

FDCAN TT Event Trigger Selection

FDCAN_TT_EVENT_TRIGGER_0

TIM2 selected as event trigger

FDCAN_TT_EVENT_TRIGGER_1

TIM3 selected as event trigger

FDCAN_TT_EVENT_TRIGGER_2

ETH selected as event trigger

FDCAN_TT_EVENT_TRIGGER_3

HRTIM selected as event trigger

FDCAN TT External Clock Synchronization

FDCAN_TT_EXT_CLK_SYNC_DISABLE

External clock synchronization in Level 0,2 disabled

FDCAN_TT_EXT_CLK_SYNC_ENABLE

External clock synchronization in Level 0,2 enabled

FDCAN TT Global Time Filtering

FDCAN_TT_GLOB_TIME_FILT_DISABLE

Global time filtering in Level 0,2 disabled

FDCAN_TT_GLOB_TIME_FILT_ENABLE

Global time filtering in Level 0,2 enabled

FDCAN TT Master State

FDCAN_TT_MASTER_OFF

Master_Off, no master properties relevant

FDCAN_TT_TIME_SLAVE

Operating as Time Slave

FDCAN_TT_BACKUP_TIME_MASTER

Operating as Backup Time Master

FDCAN_TT_CURRENT_TIME_MASTER

Operating as current Time Master

FDCAN TT Operation

FDCAN_STRICTLY_TT_OPERATION

Strictly time-triggered operation

FDCAN_EXT_EVT_SYNC_TT_OPERATION

External event-synchronized time-triggered operation

FDCAN TT reference message payload

FDCAN_TT_REF_MESSAGE_NO_PAYLOAD

Reference message has no additional payload

FDCAN_TT_REF_MESSAGE_ADD_PAYLOAD

Additional payload is taken from Tx Buffer 0

FDCAN TT repeat factor

FDCAN_TT_REPEAT_EVERY_CYCLE

Trigger valid for all cycles

FDCAN_TT_REPEAT_EVERY_2ND_CYCLE

Trigger valid every 2dn cycle

FDCAN_TT_REPEAT_EVERY_4TH_CYCLE

Trigger valid every 4th cycle

FDCAN_TT_REPEAT_EVERY_8TH_CYCLE

Trigger valid every 8th cycle

FDCAN_TT_REPEAT_EVERY_16TH_CYCLE

Trigger valid every 16th cycle

FDCAN_TT_REPEAT_EVERY_32ND_CYCLE

Trigger valid every 32nd cycle

FDCAN_TT_REPEAT_EVERY_64TH_CYCLE

Trigger valid every 64th cycle

FDCAN TT Stop Watch Polarity

FDCAN_TT_STOP_WATCH_RISING

Selected stop watch source is captured at rising edge of fdcan1_swt

FDCAN_TT_STOP_WATCH_FALLING

Selected stop watch source is captured at falling edge of fdcan1_swt

FDCAN TT Stop Watch Source

FDCAN_TT_STOP_WATCH_DISABLED

Stop Watch disabled

FDCAN_TT_STOP_WATCH_CYCLE_TIME

Actual value of cycle time is copied to Capture Time register (TTCPT.SWV)

FDCAN_TT_STOP_WATCH_LOCAL_TIME

Actual value of local time is copied to Capture Time register (TTCPT.SWV)

FDCAN_TT_STOP_WATCH_GLOBAL_TIME

Actual value of global time is copied to Capture Time register (TTCPT.SWV)

FDCAN TT Stop Watch Trigger Selection

FDCAN_TT_STOP_WATCH_TRIGGER_0

TIM2 selected as stop watch trigger

FDCAN_TT_STOP_WATCH_TRIGGER_1

TIM3 selected as stop watch trigger

FDCAN_TT_STOP_WATCH_TRIGGER_2

ETH selected as stop watch trigger

FDCAN_TT_STOP_WATCH_TRIGGER_3

HRTIM selected as stop watch trigger

FDCAN TT Synchronization State

FDCAN_TT_OUT_OF_SYNC

Out of Synchronization

FDCAN_TT_SYNCHRONIZING

Synchronizing to communication

FDCAN_TT_IN_GAP

Schedule suspended by Gap

FDCAN_TT_IN_SCHEDULE

Synchronized to schedule

FDCAN TT time mark event external

FDCAN_TT_TM_NO_EXTERNAL_EVENT

No action

FDCAN_TT_TM_GEN_EXTERNAL_EVENT

External event (pulse) is generated when trigger becomes active

FDCAN TT time mark event internal

FDCAN_TT_TM_NO_INTERNAL_EVENT

No action

FDCAN_TT_TM_GEN_INTERNAL_EVENT

Internal event is generated when trigger becomes active

FDCAN TT Time Mark Source

FDCAN_TT_REG_TIMEMARK_DIABLED

No Register Time Mark Interrupt generated

FDCAN_TT_REG_TIMEMARK_CYC_TIME

Register Time Mark Interrupt if Time Mark = cycle time

FDCAN_TT_REG_TIMEMARK_LOC_TIME

Register Time Mark Interrupt if Time Mark = local time

FDCAN_TT_REG_TIMEMARK_GLO_TIME

Register Time Mark Interrupt if Time Mark = global time

FDCAN TT Time Master

FDCAN_TT_SLAVE

Time slave

FDCAN_TT_POTENTIAL_MASTER

Potential time master

FDCAN TT trigger type

FDCAN_TT_TX_REF_TRIGGER

Transmit reference message in strictly time-triggered operation

FDCAN_TT_TX_REF_TRIGGER_GAP

Transmit reference message in external event-synchronized time-triggered operation

FDCAN_TT_TX_TRIGGER_SINGLE

Start a single transmission in an exclusive time window

FDCAN_TT_TX_TRIGGER_CONTINUOUS

Start a continuous transmission in an exclusive time window

FDCAN_TT_TX_TRIGGER_ARBITRATION

Start a transmission in an arbitration time window

FDCAN_TT_TX_TRIGGER_MERGED

Start a merged arbitration window

FDCAN_TT_WATCH_TRIGGER

Check for missing reference messages in strictly time-triggered operation

FDCAN_TT_WATCH_TRIGGER_GAP

Check for missing reference messages in external event-synchronized time-triggered operation

FDCAN_TT_RX_TRIGGER

Check for the reception of periodic messages in exclusive time windows

FDCAN_TT_TIME_BASE_TRIGGER

Generate internal/external events depending on TmEventInt/TmEventExt configuration

FDCAN_TT_END_OF_LIST

Illegal trigger, to be assigned to the unused triggers after a FDCAN_TT_WATCH_TRIGGER or FDCAN_TT_WATCH_TRIGGER_GAP

FDCAN Tx FIFO/Queue Mode

FDCAN_TX_FIFO_OPERATION

FIFO mode

FDCAN_TX_QUEUE_OPERATION

Queue mode

FDCAN Tx Event FIFO Interrupts

FDCAN_IT_TX_EVT_FIFO_ELT_LOST

Tx Event FIFO element lost

FDCAN_IT_TX_EVT_FIFO_FULL

Tx Event FIFO full

FDCAN_IT_TX_EVT_FIFO_WATERMARK

Tx Event FIFO fill level reached watermark

FDCAN_IT_TX_EVT_FIFO_NEW_DATA

Tx Handler wrote Tx Event FIFO element

FDCAN Tx Interrupts

FDCAN_IT_TX_COMPLETE

Transmission Completed

FDCAN_IT_TX_ABORT_COMPLETE

Transmission Cancellation Finished

FDCAN_IT_TX_FIFO_EMPTY

Tx FIFO Empty

FDCAN Tx Location

FDCAN_TX_BUFFER0

Add message to Tx Buffer 0

FDCAN_TX_BUFFER1

Add message to Tx Buffer 1

FDCAN_TX_BUFFER2

Add message to Tx Buffer 2

FDCAN_TX_BUFFER3

Add message to Tx Buffer 3

FDCAN_TX_BUFFER4

Add message to Tx Buffer 4

FDCAN_TX_BUFFER5

Add message to Tx Buffer 5

FDCAN_TX_BUFFER6

Add message to Tx Buffer 6

FDCAN_TX_BUFFER7

Add message to Tx Buffer 7

FDCAN_TX_BUFFER8

Add message to Tx Buffer 8

FDCAN_TX_BUFFER9

Add message to Tx Buffer 9

FDCAN_TX_BUFFER10

Add message to Tx Buffer 10

FDCAN_TX_BUFFER11

Add message to Tx Buffer 11

FDCAN_TX_BUFFER12

Add message to Tx Buffer 12

FDCAN_TX_BUFFER13

Add message to Tx Buffer 13

FDCAN_TX_BUFFER14

Add message to Tx Buffer 14

FDCAN_TX_BUFFER15

Add message to Tx Buffer 15

FDCAN_TX_BUFFER16

Add message to Tx Buffer 16

FDCAN_TX_BUFFER17

Add message to Tx Buffer 17

FDCAN_TX_BUFFER18

Add message to Tx Buffer 18

FDCAN_TX_BUFFER19

Add message to Tx Buffer 19

FDCAN_TX_BUFFER20

Add message to Tx Buffer 20

FDCAN_TX_BUFFER21

Add message to Tx Buffer 21

FDCAN_TX_BUFFER22

Add message to Tx Buffer 22

FDCAN_TX_BUFFER23

FDCAN_TX_BUFFER28

Add message to Tx Buffer 28

FDCAN_TX_BUFFER29

Add message to Tx Buffer 29

FDCAN_TX_BUFFER30

Add message to Tx Buffer 30

FDCAN_TX_BUFFER31

Add message to Tx Buffer 31

26 HAL GFXMMU Generic Driver

26.1 GFXMMU Firmware driver registers structures

26.1.1 GFXMMU_BuffersTypeDef

GFXMMU_BuffersTypeDef is defined in the stm32n6xx_hal_gfxmmu.h

Data Fields

- ***uint32_t Buf0Address***
- ***uint32_t Buf1Address***
- ***uint32_t Buf2Address***
- ***uint32_t Buf3Address***

Field Documentation

- ***uint32_t GFXMMU_BuffersTypeDef::Buf0Address***
  Physical address of buffer 0.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf1Address***
  Physical address of buffer 1.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf2Address***
  Physical address of buffer 2.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf3Address***
  Physical address of buffer 3.

26.1.2 GFXMMU_InterruptsTypeDef

GFXMMU_InterruptsTypeDef is defined in the stm32n6xx_hal_gfxmmu.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t UsedInterrupts***

Field Documentation

- ***FunctionalState GFXMMU_InterruptsTypeDef::Activation***
  Interrupts enable/disable.
- ***uint32_t GFXMMU_InterruptsTypeDef::UsedInterrupts***
  Interrupts used. This parameter can be a values combination of ***GFXMMU_Interrupts***.
  Note:
  – : Useful only when interrupts are enabled.

26.1.3 GFXMMU_InitTypeDef

GFXMMU_InitTypeDef is defined in the stm32n6xx_hal_gfxmmu.h

Data Fields

- ***uint32_t BlockSize***
- ***uint32_t DefaultValue***
- ***FunctionalState AddressTranslation***
- ***GFXMMU_BuffersTypeDef Buffers***
- ***GFXMMU_InterruptsTypeDef Interrupts***

Field Documentation

- ***uint32_t GFXMMU_InitTypeDef::BlockSize***
  Size of virtual memory block. This parameter can be a value of ***GFXMMU_BlockSize***.
- ***uint32_t GFXMMU_InitTypeDef::DefaultValue***
  Value returned when virtual memory location not physically mapped.
- ***FunctionalState GFXMMU_InitTypeDef::AddressTranslation***
  Address translation enable/disable.

- ***GFXMMU_BuffersTypeDef GFXMMU_InitTypeDef::Buffers***
  Physical buffers addresses.
- ***GFXMMU_InterruptsTypeDef GFXMMU_InitTypeDef::Interrupts***
  Interrupts parameters.

26.1.4 __GFXMMU_HandleTypeDef

__GFXMMU_HandleTypeDef is defined in the stm32n6xx_hal_gfxmmu.h

Data Fields

- ***GFXMMU_TypeDef * Instance***
- ***GFXMMU_InitTypeDef Init***
- ***HAL_GFXMMU_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***GFXMMU_TypeDef* __GFXMMU_HandleTypeDef::Instance***
  GFXMMU instance.
- ***GFXMMU_InitTypeDef __GFXMMU_HandleTypeDef::Init***
  GFXMMU init parameters.
- ***HAL_GFXMMU_StateTypeDef __GFXMMU_HandleTypeDef::State***
  GFXMMU state.
- ***__IO uint32_t __GFXMMU_HandleTypeDef::ErrorCode***
  GFXMMU error code.
- ***void(* __GFXMMU_HandleTypeDef::ErrorCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU error callback.
- ***void(* __GFXMMU_HandleTypeDef::MspInitCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU MSP init callback.
- ***void(* __GFXMMU_HandleTypeDef::MspDeInitCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU MSP de-init callback.

26.1.5 GFXMMU_LutLineTypeDef

GFXMMU_LutLineTypeDef is defined in the stm32n6xx_hal_gfxmmu.h

Data Fields

- ***uint32_t LineNumber***
- ***uint32_t LineStatus***
- ***uint32_t FirstVisibleBlock***
- ***uint32_t LastVisibleBlock***
- ***int32_t LineOffset***

Field Documentation

- ***uint32_t GFXMMU_LutLineTypeDef::LineNumber***
  LUT line number. This parameter must be a number between Min_Data = 0 and Max_Data = 1023.
- ***uint32_t GFXMMU_LutLineTypeDef::LineStatus***
  LUT line enable/disable. This parameter can be a value of ***GFXMMU_LutLineStatus***.
- ***uint32_t GFXMMU_LutLineTypeDef::FirstVisibleBlock***
  First visible block on this line. This parameter must be a number between Min_Data = 0 and Max_Data = 255.
- ***uint32_t GFXMMU_LutLineTypeDef::LastVisibleBlock***
  Last visible block on this line. This parameter must be a number between Min_Data = 0 and Max_Data = 255.

- ***int32_t GFXMMU_LutLineTypeDef::LineOffset***
  Offset of block 0 of the current line in physical buffer. This parameter must be a number between Min_Data = -255 and Max_Data = 261888.
  Note:
  – : Line offset has to be computed with the following formula: LineOffset = [(Blocks already used) - (1st visible block)].

26.1.6 GFXMMU_PackingTypeDef

GFXMMU_PackingTypeDef is defined in the stm32n6xx_hal_gfxmmu.h

Data Fields

- ***FunctionalState Buffer0Activation***
- ***uint32_t Buffer0Mode***
- ***FunctionalState Buffer1Activation***
- ***uint32_t Buffer1Mode***
- ***FunctionalState Buffer2Activation***
- ***uint32_t Buffer2Mode***
- ***FunctionalState Buffer3Activation***
- ***uint32_t Buffer3Mode***
- ***uint32_t DefaultAlpha***

Field Documentation

- ***FunctionalState GFXMMU_PackingTypeDef::Buffer0Activation***
  Packing on buffer 0 enable/disable.
- ***uint32_t GFXMMU_PackingTypeDef::Buffer0Mode***
  Buffer 0 packing mode. This parameter can be a value of ***GFXMMU_PackingModes***.
- ***FunctionalState GFXMMU_PackingTypeDef::Buffer1Activation***
  Packing on buffer 1 enable/disable.
- ***uint32_t GFXMMU_PackingTypeDef::Buffer1Mode***
  Buffer 1 packing mode. This parameter can be a value of ***GFXMMU_PackingModes***.
- ***FunctionalState GFXMMU_PackingTypeDef::Buffer2Activation***
  Packing on buffer 2 enable/disable.
- ***uint32_t GFXMMU_PackingTypeDef::Buffer2Mode***
  Buffer 2 packing mode. This parameter can be a value of ***GFXMMU_PackingModes***.
- ***FunctionalState GFXMMU_PackingTypeDef::Buffer3Activation***
  Packing on buffer 3 enable/disable.
- ***uint32_t GFXMMU_PackingTypeDef::Buffer3Mode***
  Buffer 3 packing mode. This parameter can be a value of ***GFXMMU_PackingModes***.
- ***uint32_t GFXMMU_PackingTypeDef::DefaultAlpha***
  Default alpha value. This parameter must be a number between Min_Data = 0 and Max_Data = 255.

26.2 GFXMMU Firmware driver API description

The following section lists the various functions of the GFXMMU library.

26.2.1 How to use this driver

Initialization

1. As prerequisite, fill in the HAL_GFXMMU_MspInit() :
   – Enable GFXMMU clock interface with __HAL_RCC_GFXMMU_CLK_ENABLE().
   – If interrupts are used, enable and configure GFXMMU global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
2. Configure the number of blocks per line, default value, physical buffer addresses and interrupts using the HAL_GFXMMU_Init() function.

LUT configuration

1. Use HAL_GFXMMU_DisableLutLines() to deactivate all LUT lines (or a range of lines).
2. Use HAL_GFXMMU_ConfigLut() to copy LUT from flash to look up RAM.
3. Use HAL_GFXMMU_ConfigLutLine() to configure one line of LUT.

Modify physical buffer addresses

1. Use HAL_GFXMMU_ModifyBuffers() to modify physical buffer addresses.

Packing configuration

1. Use HAL_GFXMMU_ConfigPacking() to configure packing.

Error management

1. If interrupts are used, HAL_GFXMMU_IRQHandler() will be called when an error occurs. This function will call HAL_GFXMMU_ErrorCallback(). Use HAL_GFXMMU_GetError() to get the error code.

De-initialization

1. As prerequisite, fill in the HAL_GFXMMU_MspDeInit() :
   – Disable GFXMMU clock interface with __HAL_RCC_GFXMMU_CLK_ENABLE().
   – If interrupts has been used, disable GFXMMU global interrupt with HAL_NVIC_DisableIRQ().
2. De-initialize GFXMMU using the HAL_GFXMMU_DeInit() function.

Callback registration

The compilation define USE_HAL_GFXMMU_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_GFXMMU_RegisterCallback() to register a user callback.

Function HAL_GFXMMU_RegisterCallback() allows to register following callbacks:

- ErrorCallback : GFXMMU error.
- MspInitCallback : GFXMMU MspInit.
- MspDeInitCallback : GFXMMU MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_GFXMMU_UnRegisterCallback() to reset a callback to the default weak (overridden) function. HAL_GFXMMU_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the callback ID.

This function allows to reset following callbacks:

- ErrorCallback : GFXMMU error.
- MspInitCallback : GFXMMU MspInit.
- MspDeInitCallback : GFXMMU MspDeInit.

By default, after the HAL_GFXMMU_Init and if the state is HAL_GFXMMU_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions: examples HAL_GFXMMU_ErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_GFXMMU_Init and HAL_GFXMMU_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_GFXMMU_Init and HAL_GFXMMU_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_GFXMMU_RegisterCallback before calling HAL_GFXMMU_DeInit or HAL_GFXMMU_Init function.

When the compilation define USE_HAL_GFXMMU_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

26.2.2 Detailed description of functions

HAL_GFXMMU_Init

Function name

HAL_StatusTypeDef HAL_GFXMMU_Init (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

HAL_GFXMMU_DeInit

Function name

HAL_StatusTypeDef HAL_GFXMMU_DeInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

HAL_GFXMMU_MspInit

Function name

void HAL_GFXMMU_MspInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

HAL_GFXMMU_MspDeInit

Function name

void HAL_GFXMMU_MspDeInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

HAL_GFXMMU_RegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXMMU_RegisterCallback (GFXMMU_HandleTypeDef * hgfxmmu, HAL_GFXMMU_CallbackIDTypeDef CallbackID, pGFXMMU_CallbackTypeDef pCallback)

Function description

HAL_GFXMMU_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXMMU_UnRegisterCallback (GFXMMU_HandleTypeDef * hgfxmmu, HAL_GFXMMU_CallbackIDTypeDef CallbackID)

Function description

HAL_GFXMMU_ConfigLut

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigLut (const GFXMMU_HandleTypeDef * hgfxmmu, uint32_t FirstLine, uint32_t LinesNumber, uint32_t Address)

Function description

HAL_GFXMMU_DisableLutLines

Function name

HAL_StatusTypeDef HAL_GFXMMU_DisableLutLines (const GFXMMU_HandleTypeDef * hgfxmmu, uint32_t FirstLine, uint32_t LinesNumber)

Function description

HAL_GFXMMU_ConfigLutLine

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigLutLine (const GFXMMU_HandleTypeDef * hgfxmmu, const GFXMMU_LutLineTypeDef * lutLine)

Function description

HAL_GFXMMU_ModifyBuffers

Function name

HAL_StatusTypeDef HAL_GFXMMU_ModifyBuffers (GFXMMU_HandleTypeDef * hgfxmmu, const GFXMMU_BuffersTypeDef * Buffers)

Function description

HAL_GFXMMU_ConfigPacking

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigPacking (GFXMMU_HandleTypeDef * hgfxmmu, const GFXMMU_PackingTypeDef * pPacking)

Function description

HAL_GFXMMU_IRQHandler

Function name

void HAL_GFXMMU_IRQHandler (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

HAL_GFXMMU_ErrorCallback

Function name

void HAL_GFXMMU_ErrorCallback (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

HAL_GFXMMU_GetState

Function name

HAL_GFXMMU_StateTypeDef HAL_GFXMMU_GetState (const GFXMMU_HandleTypeDef * hgfxmmu)

Function description

HAL_GFXMMU_GetError

Function name

uint32_t HAL_GFXMMU_GetError (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

26.3 GFXMMU Firmware driver defines

The following section lists the various define and macros of the module.

26.3.1 GFXMMU

GFXMMU

GFXMMU block size

GFXMMU_12BYTE_BLOCKS

Blocks of 12-byte.

GFXMMU_16BYTE_BLOCKS

Blocks of 16-byte.

GFXMMU Error Code

GFXMMU_ERROR_NONE

No error.

GFXMMU_ERROR_BUFFER0_OVERFLOW

Buffer 0 overflow.

GFXMMU_ERROR_BUFFER1_OVERFLOW

Buffer 1 overflow.

GFXMMU_ERROR_BUFFER2_OVERFLOW

Buffer 2 overflow.

GFXMMU_ERROR_BUFFER3_OVERFLOW

Buffer 3 overflow.

GFXMMU_ERROR_BUS_MASTER

Bus master error.

GFXMMU_ERROR_INVALID_CALLBACK

Invalid callback error.

GFXMMU Exported Macros

__HAL_GFXMMU_RESET_HANDLE_STATE

Description:

- Reset GFXMMU handle state.

Parameters:

- __HANDLE__: GFXMMU handle.

Return value:

- None

GFXMMU interrupts

GFXMMU_BUS_MASTER_ERROR_IT

Bus master error interrupt.

GFXMMU_BUFFER0_OVERFLOW_IT

Buffer 0 overflow interrupt.

GFXMMU_BUFFER1_OVERFLOW_IT

Buffer 1 overflow interrupt.

GFXMMU_BUFFER2_OVERFLOW_IT

Buffer 2 overflow interrupt.

GFXMMU_BUFFER3_OVERFLOW_IT

Buffer 3 overflow interrupt.

GFXMMU LUT line status

GFXMMU_LUT_LINE_DISABLE

LUT line disabled.

GFXMMU_LUT_LINE_ENABLE

LUT line enabled.

GFXMMU packing modes

GFXMMU_PACKING_MSB_REMOVE

Remove MSB during packing operation.

GFXMMU_PACKING_LSB_REMOVE

Remove LSB during packing operation.

27 HAL GFXTIM Generic Driver

27.1 GFXTIM Firmware driver registers structures

27.1.1 GFXTIM_InitTypeDef

GFXTIM_InitTypeDef is defined in the stm32n6xx_hal_gfxtim.h

Data Fields

- ***uint32_t SynchroSrc***
- ***uint32_t TearingEffectSrc***
- ***uint32_t TearingEffectPolarity***
- ***uint32_t TearingEffectInterrupt***

Field Documentation

- ***uint32_t GFXTIM_InitTypeDef::SynchroSrc***
  Synchronization signals (HSYNC and VSYNC) sources. This parameter can be a value of ***GFXTIM_SynchroSrc***
- ***uint32_t GFXTIM_InitTypeDef::TearingEffectSrc***
  Tearing effect source This parameter can be a value of ***GFXTIM_TearingEffectSrc***
- ***uint32_t GFXTIM_InitTypeDef::TearingEffectPolarity***
  Tearing effect source This parameter can be a value of ***GFXTIM_TearingEffectPolarity***
- ***uint32_t GFXTIM_InitTypeDef::TearingEffectInterrupt***
  Tearing effect interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

27.1.2 __GFXTIM_HandleTypeDef

__GFXTIM_HandleTypeDef is defined in the stm32n6xx_hal_gfxtim.h

Data Fields

- ***GFXTIM_TypeDef * Instance***
- ***__IO HAL_GFXTIM_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***GFXTIM_InitTypeDef Init***
- ***void(* HAL_GFXTIM_AbsoluteTimer_AFCC1Callback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_AFCOFCallback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_ALCC1Callback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_ALCC2Callback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_ALCOFCallback***
- ***void(* HAL_GFXTIM_RelativeTimer_RFC1RCallback***
- ***void(* HAL_GFXTIM_RelativeTimer_RFC2RCallback***
- ***void(* HAL_GFXTIM_TECallback***
- ***void(* HAL_GFXTIM_EventGenerator_EV1Callback***
- ***void(* HAL_GFXTIM_EventGenerator_EV2Callback***
- ***void(* HAL_GFXTIM_EventGenerator_EV3Callback***
- ***void(* HAL_GFXTIM_EventGenerator_EV4Callback***
- ***void(* HAL_GFXTIM_WatchdogTimer_AlarmCallback***
- ***void(* HAL_GFXTIM_WatchdogTimer_PreAlarmCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***GFXTIM_TypeDef* __GFXTIM_HandleTypeDef::Instance***
  GFXTIM instance

- ***__IO HAL_GFXTIM_StateTypeDef __GFXTIM_HandleTypeDef::State***
  GFXTIM state
- ***__IO uint32_t __GFXTIM_HandleTypeDef::ErrorCode***
  GFXTIM error code
- ***GFXTIM_InitTypeDef __GFXTIM_HandleTypeDef::Init***
  GFXTIM initialization
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_AFCC1Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute frame counter compare 1 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_AFCOFCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute frame counter overflow callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_ALCC1Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute line counter compare 1 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_ALCC2Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute line counter compare 2 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_ALCOFCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute line counter overflow callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_RelativeTimer_RFC1RCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Relative frame counter 1 reload callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_RelativeTimer_RFC2RCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Relative frame counter 2 reload callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_TECallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Tearing effect callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV1Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 1 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV2Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 2 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV3Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 3 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV4Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 4 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_WatchdogTimer_AlarmCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Watchdog alarm callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_WatchdogTimer_PreAlarmCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Watchdog pre alarm callback
- ***void(* __GFXTIM_HandleTypeDef::ErrorCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM error callback
- ***void(* __GFXTIM_HandleTypeDef::MspInitCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM MSP initialization user callback
- ***void(* __GFXTIM_HandleTypeDef::MspDeInitCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM MSP de-initialization user callback

27.1.3 GFXTIM_ClockGeneratorConfigTypeDef

GFXTIM_ClockGeneratorConfigTypeDef is defined in the stm32n6xx_hal_gfxtim.h

Data Fields

- ***uint32_t LCCHwReloadSrc***
- ***uint32_t LCCReloadValue***
- ***uint32_t LCCClockSrc***
- ***uint32_t LineClockSrc***
- ***uint32_t FCCHwReloadSrc***
- ***uint32_t FCCReloadValue***
- ***uint32_t FCCClockSrc***
- ***uint32_t FrameClockSrc***
- ***uint32_t LineClockCalib***
- ***uint32_t FrameClockCalib***

Field Documentation

- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LCCHwReloadSrc***
  Line Clock Counter hardware reload source This parameter can be a value of ***GFXTIM_LCCHwReloadSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LCCReloadValue***
  Line Clock Counter reload value (22 bits) This parameter must be a number between Min_Data = 1 and Max_Data = 4194303
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LCCClockSrc***
  Line Clock Counter Clock Source This parameter can be a value of ***GFXTIM_LCCClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LineClockSrc***
  Line Clock Source This parameter can be a value of ***GFXTIM_LineClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FCCHwReloadSrc***
  Frame Clock Counter hardware reload source This parameter can be a value of ***GFXTIM_FCCHwReloadSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FCCReloadValue***
  Frame Clock Counter reload value (12 bits) This parameter must be a number between Min_Data = 1 and Max_Data = 4095
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FCCClockSrc***
  Frame Clock Counter Clock Source This parameter can be a value of ***GFXTIM_FCCClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FrameClockSrc***
  Frame Clock Source This parameter can be a value of ***GFXTIM_FrameClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LineClockCalib***
  Debug purpose This parameter can be a value of ***GFXTIM_LineClockCalib***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FrameClockCalib***
  Debug purpose This parameter can be a value of ***GFXTIM_FrameClockCalib***

27.1.4 GFXTIM_AbsoluteTimerConfigTypeDef

GFXTIM_AbsoluteTimerConfigTypeDef is defined in the stm32n6xx_hal_gfxtim.h

Data Fields

- ***uint32_t FrameCompare1Value***
- ***uint32_t FrameCounterValue***
- ***uint32_t FrameOverflowInterrupt***
- ***uint32_t FrameCompare1Interrupt***
- ***uint32_t LineCompare1Value***
- ***uint32_t LineCompare2Value***
- ***uint32_t LineCounterValue***
- ***uint32_t LineOverflowInterrupt***
- ***uint32_t LineCompare1Interrupt***
- ***uint32_t LineCompare2Interrupt***

Field Documentation

- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameCompare1Value***
  Absolute Frame Compare 1 value (20 bits) This parameter must be a number between 1 and 1048575

- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameCounterValue***
  Absolute Frame Counter initial value (20 bits) This parameter must be a number between 1 and 1048575
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameOverflowInterrupt***
  Absolute Frame Counter Overflow Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameCompare1Interrupt***
  Absolute Frame Compare 1 Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare1Value***
  Absolute Line Compare 1 value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare2Value***
  Absolute Line Compare 2 value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCounterValue***
  Absolute Line Counter value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineOverflowInterrupt***
  Absolute Line Counter Overflow Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare1Interrupt***
  Absolute Line Compare 1 Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare2Interrupt***
  Absolute Line Compare 2 Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

27.1.5 GFXTIM_RelativeTimerConfigTypeDef

GFXTIM_RelativeTimerConfigTypeDef is defined in the stm32n6xx_hal_gfxtim.h

Data Fields

- ***uint32_t AutoReloadValue***
- ***uint32_t CounterMode***
- ***uint32_t ReloadInterrupt***

Field Documentation

- ***uint32_t GFXTIM_RelativeTimerConfigTypeDef::AutoReloadValue***
  Auto reload value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_RelativeTimerConfigTypeDef::CounterMode***
  Counter Mode This parameter can be a value of GFXTIM_RelativeCounterMode
- ***uint32_t GFXTIM_RelativeTimerConfigTypeDef::ReloadInterrupt***
  Relative Frame Counter Reload Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

27.1.6 GFXTIM_EventGeneratorConfigTypeDef

GFXTIM_EventGeneratorConfigTypeDef is defined in the stm32n6xx_hal_gfxtim.h

Data Fields

- ***uint32_t LineEvent***
- ***uint32_t FrameEvent***
- ***uint32_t EventInterrupt***

Field Documentation

- ***uint32_t GFXTIM_EventGeneratorConfigTypeDef::LineEvent***
  Line event selection This parameter can be a value of GFXTIM_EventLine
- ***uint32_t GFXTIM_EventGeneratorConfigTypeDef::FrameEvent***
  Frmae event selection This parameter can be a value of GFXTIM_EventFrame
- ***uint32_t GFXTIM_EventGeneratorConfigTypeDef::EventInterrupt***
  Event interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

27.1.7 GFXTIM_WatchdogConfigTypeDef

GFXTIM_WatchdogConfigTypeDef is defined in the stm32n6xx_hal_gfxtim.h

Data Fields

- ***uint32_t ClockSrc***
- ***uint32_t AutoReloadValue***
- ***uint32_t HwReloadConfig***
- ***uint32_t PreAlarmValue***
- ***uint32_t AlarmInterrupt***
- ***uint32_t PreAlarmInterrupt***

Field Documentation

- ***uint32_t GFXTIM_WatchdogConfigTypeDef::ClockSrc***
  Clock source This parameter can be a value of GFXTIM_WatchdogClockSrc
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::AutoReloadValue***
  Reload value (16 bits) This parameter must be a number between 1 and 65535
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::HwReloadConfig***
  Hardware reload configuration This parameter can be a value of GFXTIM_WatchdogHwReloadConfig
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::PreAlarmValue***
  Pre-alarm value (16 bits) This parameter must be a number between 1 and 65535
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::AlarmInterrupt***
  Interrupt Enable or Disable when watchdog counter reaches 0 This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::PreAlarmInterrupt***
  Interrupt Enable or Disable when watchdog counter reaches pre-alarm value This parameter can be a value of ***GFXTIM_Interrupt***

27.2 GFXTIM Firmware driver API description

The following section lists the various functions of the GFXTIM library.

27.2.1 How to use this driver

Initialization and de-initialization

1. User has first to initialize GFXTIM.
2. As prerequisite, fill in the HAL_GFXTIM_MspInit() :
   – Enable GFXTIM with __HAL_RCC_GFXTIM_CLK_ENABLE
   – Enable the clocks for the used GPIOS with __HAL_RCC_GPIOx_CLK_ENABLE().
   – Configure these pins in alternate mode using HAL_GPIO_Init().
   – If interrupt mode is used, enable and configure GFXTIM interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
1. User can de-initialize GFXTIM with HAL_GFXTIM_DeInit() function.

generic functions

1. HAL_GFXTIM_IRQHandler will be called when GFXTIM interrupt occurs.
2. HAL_GFXTIM_ErrorCallback will be called when GFXTIM or ADF error occurs.
3. Use HAL_GFXTIM_GetState() to get the current GFXTIM or ADF instance state.
4. Use HAL_GFXTIM_GetErrorCode() to get the current GFXTIM or ADF instance error code. #if defined(GENERATOR_CALLBACKS_REGISTERING_AVAILABLE)

Callback registration

27.2.2 Detailed description of functions

HAL_GFXTIM_Init

Function name

HAL_StatusTypeDef HAL_GFXTIM_Init (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_DeInit

Function name

HAL_StatusTypeDef HAL_GFXTIM_DeInit (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_MspInit

Function name

void HAL_GFXTIM_MspInit (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_MspDeInit

Function name

void HAL_GFXTIM_MspDeInit (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_RegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXTIM_RegisterCallback (GFXTIM_HandleTypeDef * hgfxtim, HAL_GFXTIM_CallbackIDTypeDef CallbackID, pGFXTIM_CallbackTypeDef pCallback)

Function description

HAL_GFXTIM_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXTIM_UnRegisterCallback (GFXTIM_HandleTypeDef * hgfxtim, HAL_GFXTIM_CallbackIDTypeDef CallbackID)

Function description

HAL_GFXTIM_TECallback

Function name

void HAL_GFXTIM_TECallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_ClockGenerator_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_ClockGenerator_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_ClockGeneratorConfigTypeDef * pClockGeneratorConfig)

Function description

HAL_GFXTIM_ClockGenerator_Reload

Function name

HAL_StatusTypeDef HAL_GFXTIM_ClockGenerator_Reload (GFXTIM_HandleTypeDef * hgfxtim, uint32_t ClockGeneratorCounter)

Function description

HAL_GFXTIM_AbsoluteTimer_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_AbsoluteTimerConfigTypeDef * pAbsoluteTimerConfig)

Function description

HAL_GFXTIM_AbsoluteTimer_Start

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Start (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_AbsoluteTimer_Stop

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Stop (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_AbsoluteTimer_Reset

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Reset (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_AbsoluteTimer_GetCounter

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_GetCounter (const GFXTIM_HandleTypeDef * hgfxtim, uint32_t AbsoluteTime, uint32_t * pValue)

Function description

HAL_GFXTIM_AbsoluteTimer_SetFrameCompare

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_SetFrameCompare (GFXTIM_HandleTypeDef * hgfxtim, uint32_t Value)

Function description

HAL_GFXTIM_AbsoluteTimer_SetLineCompare

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_SetLineCompare (GFXTIM_HandleTypeDef * hgfxtim, uint32_t AbsoluteLineComparator, uint32_t Value)

Function description

HAL_GFXTIM_AbsoluteTimer_AFCC1Callback

Function name

void HAL_GFXTIM_AbsoluteTimer_AFCC1Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_AbsoluteTimer_AFCOFCallback

Function name

void HAL_GFXTIM_AbsoluteTimer_AFCOFCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_AbsoluteTimer_ALCC1Callback

Function name

void HAL_GFXTIM_AbsoluteTimer_ALCC1Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_AbsoluteTimer_ALCC2Callback

Function name

void HAL_GFXTIM_AbsoluteTimer_ALCC2Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_AbsoluteTimer_ALCOFCallback

Function name

void HAL_GFXTIM_AbsoluteTimer_ALCOFCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_RelativeTimer_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_RelativeTimerConfigTypeDef * pRelativeTimerConfig, uint32_t RelativeTimer)

Function description

HAL_GFXTIM_RelativeTimer_Start

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_Start (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer)

Function description

HAL_GFXTIM_RelativeTimer_Stop

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_Stop (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer)

Function description

HAL_GFXTIM_RelativeTimer_ForceReload

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_ForceReload (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer)

Function description

HAL_GFXTIM_RelativeTimer_SetReload

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_SetReload (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer, uint32_t Value)

Function description

HAL_GFXTIM_RelativeTimer_GetCounter

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_GetCounter (const GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer, uint32_t * pValue)

Function description

HAL_GFXTIM_RelativeTimer_RFC1RCallback

Function name

void HAL_GFXTIM_RelativeTimer_RFC1RCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_RelativeTimer_RFC2RCallback

Function name

void HAL_GFXTIM_RelativeTimer_RFC2RCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_EventGenerator_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_EventGenerator_Config (GFXTIM_HandleTypeDef * hgfxtim, uint32_t EventGenerator, const GFXTIM_EventGeneratorConfigTypeDef * pEventGeneratorConfig)

Function description

HAL_GFXTIM_EventGenerator_Enable

Function name

HAL_StatusTypeDef HAL_GFXTIM_EventGenerator_Enable (GFXTIM_HandleTypeDef * hgfxtim, uint32_t EventGenerator)

Function description

HAL_GFXTIM_EventGenerator_Disable

Function name

HAL_StatusTypeDef HAL_GFXTIM_EventGenerator_Disable (GFXTIM_HandleTypeDef * hgfxtim, uint32_t EventGenerator)

Function description

HAL_GFXTIM_EventGenerator_EV1Callback

Function name

void HAL_GFXTIM_EventGenerator_EV1Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_EventGenerator_EV2Callback

Function name

void HAL_GFXTIM_EventGenerator_EV2Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_EventGenerator_EV3Callback

Function name

void HAL_GFXTIM_EventGenerator_EV3Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_EventGenerator_EV4Callback

Function name

void HAL_GFXTIM_EventGenerator_EV4Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_WatchdogTimer_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_WatchdogTimer_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_WatchdogConfigTypeDef * pWatchdogConfig)

Function description

HAL_GFXTIM_WatchdogTimer_Enable

Function name

HAL_StatusTypeDef HAL_GFXTIM_WatchdogTimer_Enable (GFXTIM_HandleTypeDef * hgfxtim)

Function description

HAL_GFXTIM_WatchdogTimer_Disable

Function name

HAL_StatusTypeDef HAL_GFXTIM_WatchdogTimer_Disable (GFXTIM_HandleTypeDef * hgfxtim)

27.3 GFXTIM Firmware driver defines

The following section lists the various define and macros of the module.

27.3.1 GFXTIM

GFXTIM

GFXTIM Absolute Line Comparator

GFXTIM_ABSOLUTE_LINE_COMPARE1

Absolute line compare 1

GFXTIM_ABSOLUTE_LINE_COMPARE2

Absolute line compare 2

GFXTIM Absolute Time

GFXTIM_ABSOLUTE_GLOBAL_TIME

Absolute global time (frame and line) counters ATR

GFXTIM_ABSOLUTE_FRAME_TIME

Absolute frame counter AFCR

GFXTIM_ABSOLUTE_LINE_TIME

Absolute line counter ALCR

GFXTIM Clock Generator Counter

GFXTIM_LINE_CLK_COUNTER

Line clock counter

GFXTIM_FRAME_CLK_COUNTER

Frame clock counter

GFXTIM Error Code

GFXTIM_ERROR_NONE

No error

GFXTIM_ERROR_STATE

State error

GFXTIM_ERROR_INVALID_CALLBACK

Invalid callback error occurs

GFXTIM Event generator Frame Source selection

GFXTIM_FRAME_EVENT_NONE

None

GFXTIM_FRAME_EVENT_AFC_OVERFLOW

Absolute frame counter overflow

GFXTIM_FRAME_EVENT_AFC_COMPARE

Absolute frame counter compare

GFXTIM_FRAME_EVENT_RFC1_RELOAD

Relative frame counter 1 reload

GFXTIM_FRAME_EVENT_RFC2_RELOAD

Relative frame counter 1 reload

GFXTIM Event Generator ID

GFXTIM_EVENT_GENERATOR_1

Event Generator 1

GFXTIM_EVENT_GENERATOR_2

Event Generator 2

GFXTIM_EVENT_GENERATOR_3

Event Generator 3

GFXTIM_EVENT_GENERATOR_4

Event Generator 4

GFXTIM Event generator Line source selection

GFXTIM_LINE_EVENT_NONE

None

GFXTIM_LINE_EVENT_ALC_OVERFLOW

Absolute line counter overflow

GFXTIM_LINE_EVENT_TE

Tearing effect

GFXTIM_LINE_EVENT_ALC1_COMPARE

Absolute line counter 1 compare

GFXTIM_LINE_EVENT_ALC2_COMPARE

Absolute line counter 2 compare

GFXTIM Exported Macros

__HAL_GFXTIM_RESET_HANDLE_STATE

Description:

- Reset GFXTIM handle state.

Parameters:

- __HANDLE__: GFXTIM handle.

Return value:

- None

__HAL_GFXTIM_GET_FLAG

Description:

- Check whether the specified GFXTIM flag is set or not.

Parameters:

- __HANDLE__: GFXTIM handle
- __FLAG__: GFXTIM flag This parameter can be one or a combination of the following values:
  - GFXTIM_FLAG_AFCO Absolute Frame Counter Overflow Flag
  - GFXTIM_FLAG_ALCO Absolute Line Counter Overflow Flag
  - GFXTIM_FLAG_TE Tearing Effect Flag
  - GFXTIM_FLAG_AFCC1 Absolute Frame Counter Compare 1 Flag
  - GFXTIM_FLAG_ALCC1 Absolute Line Counter Compare 1 Flag
  - GFXTIM_FLAG_ALCC2 Absolute Line Counter Compare 2 Flag
  - GFXTIM_FLAG_RFC1R Relative Frame Counter 1 Reload Flag
  - GFXTIM_FLAG_RFC2R Relative Frame Counter 2 Reload Flag
  - GFXTIM_FLAG_EV1 Event 1 Flag
  - GFXTIM_FLAG_EV2 Event 2 Flag
  - GFXTIM_FLAG_EV3 Event 3 Flag
  - GFXTIM_FLAG_EV4 Event 4 Flag
  - GFXTIM_FLAG_WDGA Watchdog Alarm Flag
  - GFXTIM_FLAG_WDGP Watchdog Pre-alarm Flag

Return value:

- State: of flag (TRUE or FALSE).

__HAL_GFXTIM_CLEAR_FLAG

Description:

- Clear the specified GFXTIM flag.

Parameters:

- __HANDLE__: GFXTIM handle
- __FLAG__: GFXTIM flag This parameter can be one or a combination of the following values:
  - GFXTIM_FLAG_AFCO Absolute Frame Counter Overflow Flag
  - GFXTIM_FLAG_ALCO Absolute Line Counter Overflow Flag
  - GFXTIM_FLAG_TE Tearing Effect Flag
  - GFXTIM_FLAG_AFCC1 Absolute Frame Counter Compare 1 Flag
  - GFXTIM_FLAG_ALCC1 Absolute Line Counter Compare 1 Flag
  - GFXTIM_FLAG_ALCC2 Absolute Line Counter Compare 2 Flag
  - GFXTIM_FLAG_RFC1R Relative Frame Counter 1 Reload Flag
  - GFXTIM_FLAG_RFC2R Relative Frame Counter 2 Reload Flag
  - GFXTIM_FLAG_EV1 Event 1 Flag
  - GFXTIM_FLAG_EV2 Event 2 Flag
  - GFXTIM_FLAG_EV3 Event 3 Flag
  - GFXTIM_FLAG_EV4 Event 4 Flag
  - GFXTIM_FLAG_WDGA Watchdog Alarm Flag
  - GFXTIM_FLAG_WDGP Watchdog Pre-alarm Flag

Return value:

- None

GFXTIM Frame CLock Counter Clock Source

GFXTIM_FCC_CLK_SRC_DISABLE

Disable

Event Generator 4 output

GFXTIM Watchdog hardware reload configuration

GFXTIM_WATCHDOG_HW_RELOAD_DISABLE

Watchdog hardware reload is disable

GFXTIM_WATCHDOG_HW_RELOAD_RISING_EDGE

Watchdog is reload on rising edge of gfxtim_wrld

GFXTIM_WATCHDOG_HW_RELOAD_FALLING_EDGE

Watchdog is reload on falling edge of gfxtim_wrld

28 HAL GPIO Generic Driver

28.1 GPIO Firmware driver registers structures

28.1.1 GPIO_InitTypeDef

GPIO_InitTypeDef is defined in the stm32n6xx_hal_gpio.h

Data Fields

- ***uint32_t Pin***
- ***uint32_t Mode***
- ***uint32_t Pull***
- ***uint32_t Speed***
- ***uint32_t Alternate***

Field Documentation

- ***uint32_t GPIO_InitTypeDef::Pin***
  Specifies the GPIO pins to be configured. This parameter can be any value of ***GPIO_pins***
- ***uint32_t GPIO_InitTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***GPIO_mode***
- ***uint32_t GPIO_InitTypeDef::Pull***
  Specifies the Pull-up or Pull-Down activation for the selected pins. This parameter can be a value of ***GPIO_pull***
- ***uint32_t GPIO_InitTypeDef::Speed***
  Specifies the speed for the selected pins. This parameter can be a value of ***GPIO_speed***
- ***uint32_t GPIO_InitTypeDef::Alternate***
  Peripheral to be connected to the selected pins This parameter can be a value of ***GPIOEx_Alternate_function_selection***

28.1.2 GPIO_DelayTypeDef

GPIO_DelayTypeDef is defined in the stm32n6xx_hal_gpio.h

Data Fields

- ***uint32_t Delay***
- ***uint32_t Path***

Field Documentation

- ***uint32_t GPIO_DelayTypeDef::Delay***
  Specifies the delay to apply on signal of a pin. This parameter can be a value of ***GPIO_delay***
- ***uint32_t GPIO_DelayTypeDef::Path***
  Specifies the path of the delay. This parameter can be a value of ***GPIO_path***

28.1.3 GPIO_RetimeTypeDef

GPIO_RetimeTypeDef is defined in the stm32n6xx_hal_gpio.h

Data Fields

- ***uint32_t Retime***
- ***uint32_t Edge***

Field Documentation

- ***uint32_t GPIO_RetimeTypeDef::Retime***
  Enable or disable the retime functionality on a pin This parameter can be any value of ***GPIO_retime***
- ***uint32_t GPIO_RetimeTypeDef::Edge***
  Specifies the clock edge for retime functionality. This parameter can be a value of ***GPIO_clock***

28.2 GPIO Firmware driver API description

The following section lists the various functions of the GPIO library.

28.2.1 GPIO Peripheral features

- Each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:
  - Input mode
  - Analog mode
  - Output mode
  - Alternate function mode
  - External interrupt/event lines
- During and just after reset, the alternate functions and external interrupt lines are not active and the I/O ports are configured in analog mode.
- All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not.
- In Output or Alternate mode, each IO can be configured on open-drain or push-pull type and the IO speed can be selected depending on the VDD value.
- The microcontroller IO pins are connected to onboard peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an IO pin at a time. In this way, there can be no conflict between peripherals sharing the same IO pin.
- All ports have external interrupt/event capability. To use external interrupt lines, the port must be configured in input mode. All available GPIO pins are connected to the 16 external interrupt/event lines from EXTI0 to EXTI15.
- The external interrupt/event controller consists of up to 73 edge detectors (16 lines are connected to GPIO) for generating event/interrupt requests (each input line can be independently configured to select the type (interrupt or event) and the corresponding trigger event (rising or falling or both). Each line can also be masked independently.

28.2.2 How to use this driver

1. Enable the GPIO AHB clock using the following function: __HAL_RCC_GPIOx_CLK_ENABLE().
2. Configure the GPIO pin(s) using HAL_GPIO_Init().
   - Configure the IO mode using "Mode" member from GPIO_InitTypeDef structure
   - Activate Pull-up, Pull-down resistor using "Pull" member from GPIO_InitTypeDef structure.
   - In case of Output or alternate function mode selection: the speed is configured through "Speed" member from GPIO_InitTypeDef structure.
   - In alternate mode is selection, the alternate function connected to the IO is configured through "Alternate" member from GPIO_InitTypeDef structure.
   - Analog mode is required when a pin is to be used as ADC channel or DAC output.
   - In case of external interrupt/event selection the "Mode" member from GPIO_InitTypeDef structure select the type (interrupt or event) and the corresponding trigger event (rising or falling or both).
3. In case of external interrupt/event mode selection, configure NVIC IRQ priority mapped to the EXTI line using HAL_NVIC_SetPriority() and enable it using HAL_NVIC_EnableIRQ().
4. To get the level of a pin configured in input mode use HAL_GPIO_ReadPin().
5. To set/reset the level of a pin configured in output mode use HAL_GPIO_WritePin()/HAL_GPIO_TogglePin().
6. To set the level of several pins and reset level of several other pins in same cycle, use HAL_GPIO_WriteMultipleStatePin().
7. To lock pin configuration until next reset use HAL_GPIO_LockPin().
8. During and just after reset, the alternate functions are not active and the GPIO pins are configured in analog mode (except JTAG pins).
9. The LSE oscillator pins OSC32_IN and OSC32_OUT can be used as general purpose (PC14 and PC15, respectively) when the LSE oscillator is off. The LSE has priority over the GPIO function.
10. The HSE oscillator pins OSC_IN/OSC_OUT can be used as general purpose PH0 and PH1, respectively, when the HSE oscillator is off. The HSE has priority over the GPIO function.

28.2.3 IO attributes functions

This section contains the following APIs:

- ***HAL_GPIO_LockPinAttributes()***

- *HAL_GPIO_GetLockPinAttributes()*
- *HAL_GPIO_ConfigPinAttributes()*
- *HAL_GPIO_GetConfigPinAttributes()*

28.2.4 Initialization and de-initialization functions

This section contains the following APIs:

- *HAL_GPIO_Init()*
- *HAL_GPIO_DeInit()*

28.2.5 Detailed description of functions

HAL_GPIO_Init

Function name

void HAL_GPIO_Init (GPIO_TypeDef * GPIOx, const GPIO_InitTypeDef * GPIO_Init)

Function description

Initialize the GPIOx peripheral according to the specified parameters in the GPIO_Init.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Init:** pointer to a GPIO_InitTypeDef structure that contains the configuration information for the specified GPIO peripheral.

Return values

- **None:**

Notes

- If GPIOx peripheral pin is used in EXTI_MODE and the pin is secure/privilege, it is up to the application to insure that the corresponding EXTI line is set secure/privilege.

HAL_GPIO_DeInit

Function name

void HAL_GPIO_DeInit (GPIO_TypeDef * GPIOx, uint32_t GPIO_Pin)

Function description

De-initialize the GPIOx peripheral registers to their default reset values.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

HAL_GPIO_ReadPin

Function name

GPIO_PinState HAL_GPIO_ReadPin (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Read the specified input port pin.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Pin:** specifies the port bit to read. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **The:** input port pin value.

HAL_GPIO_WritePin

Function name

void HAL_GPIO_WritePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, GPIO_PinState PinState)

Function description

Set or clear the selected data port bit.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).
- **PinState:** specifies the value to be written to the selected bit. This parameter can be one of the GPIO_PinState enum values:
  - GPIO_PIN_RESET: to clear the port pin
  - GPIO_PIN_SET: to set the port pin

Return values

- **None:**

Notes

- This function uses GPIOx_BSRR and GPIOx_BRR registers to allow atomic read/modify accesses. In this way, there is no risk of an IRQ occurring between the read and the modify access.

HAL_GPIO_TogglePin

Function name

void HAL_GPIO_TogglePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Toggle the specified GPIO pin.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Pin:** specifies the pin to be toggled. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

HAL_GPIO_WriteMultipleStatePin

Function name

void HAL_GPIO_WriteMultipleStatePin (GPIO_TypeDef * GPIOx, uint16_t PinReset, uint16_t PinSet)

Function description

Set and clear several pins of a dedicated port in same cycle.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **PinReset:** specifies the port bits to be reset This parameter can be any combination of GPIO_Pin_x where x can be (0..15) or zero.
- **PinSet:** specifies the port bits to be set This parameter can be any combination of GPIO_Pin_x where x can be (0..15) or zero.

Return values

- **None:**

Notes

- Both PinReset and PinSet combinations shall not get any common bit, else assert would be triggered.
- At least one of the two parameters used to set or reset shall be different from zero.

HAL_GPIO_LockPin

Function name

HAL_StatusTypeDef HAL_GPIO_LockPin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Lock GPIO Pins configuration registers.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Pin:** specifies the port bits to be locked. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **HAL_OK:** if success, HAL_ERROR otherwise

Notes

- The locked registers are GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_AFRL, GPIOx_AFRH, GPIOx_DELAYRL, GPIOx_DELAYRH, GPIOx_ADVCFGRL, GPIOx_ADVCFGRH.
- The configuration of the locked GPIO pins can no longer be modified until the next reset.

HAL_GPIO_SetRetime

Function name

void HAL_GPIO_SetRetime (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, const GPIO_RetimeTypeDef * pRet_Init)

Function description

Configure GPIO retime on specified GPIO pin.

Parameters

- **GPIOx:** where x can be (A..H and N..Q)
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).
- **pRet_Init:** pointer to a GPIO_RetimeTypeDef structure that contains the retime configuration information for the specified GPIO peripheral.

Return values

- **None:**

HAL_GPIO_GetRetime

Function name

HAL_StatusTypeDef HAL_GPIO_GetRetime (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, GPIO_RetimeTypeDef * pRet_Init)

Function description

Get GPIO retime configuration on specified GPIO pin.

Parameters

- **GPIOx:** where x can be (A..H and N..Q)
- **GPIO_Pin:** specifies the port bit to read. This parameter can be GPIO_PIN_x where x can be (0..15).
- **pRet_Init:** pointer to the return GPIO_RetimeTypeDef structure that contains the retime information

Return values

- **HAL:** Status

HAL_GPIO_SetDelay

Function name

void HAL_GPIO_SetDelay (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, const GPIO_DelayTypeDef * pDly_Init)

Function description

Configure GPIO delay on specified GPIO pin.

Parameters

- **GPIOx:** where x can be (A..H and N..Q)
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).
- **pDly_Init:** pointer to a GPIO_DelayTypeDef structure that contains the delay configuration information for the specified GPIO peripheral.

Return values

- **None:**

HAL_GPIO_GetDelay

Function name

HAL_StatusTypeDef HAL_GPIO_GetDelay (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, GPIO_DelayTypeDef * pDly_Init)

Function description

Get GPIO delay configuration on specified GPIO pin.

Parameters

- **GPIOx:** where x can be (A..H and N..Q)
- **GPIO_Pin:** specifies the port bit to read. This parameter can be GPIO_PIN_x where x can be (0..15).
- **pDly_Init:** pointer to the return GPIO_DelayTypeDef structure that contains the delay information

Return values

- **HAL:** Status

HAL_GPIO_EXTI_IRQHandler

Function name

void HAL_GPIO_EXTI_IRQHandler (uint16_t GPIO_Pin)

Function description

Handle EXTI interrupt request.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_EXTI_Rising_Callback

Function name

void HAL_GPIO_EXTI_Rising_Callback (uint16_t GPIO_Pin)

Function description

EXTI line rising detection callback.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_EXTI_Falling_Callback

Function name

void HAL_GPIO_EXTI_Falling_Callback (uint16_t GPIO_Pin)

Function description

EXTI line falling detection callback.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_LockPinAttributes

Function name

void HAL_GPIO_LockPinAttributes (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Lock security and privilege configuration of several pins for a dedicated port.

Parameters

- **GPIOx:** GPIO Port
- **GPIO_Pin:** specifies the port bit to be locked. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

Notes

- When the lock sequence has been applied on a port bit, the value of this port bit can no longer be modified until the next reset. Set sequence only available in secure and privilege.
- Each lock bit freezes a security configuration register (control and alternate function registers).

HAL_GPIO_GetLockPinAttributes

Function name

uint32_t HAL_GPIO_GetLockPinAttributes (const GPIO_TypeDef * GPIOx)

Function description

Get lock security and privilege configuration of several pins for a dedicated port.

Parameters

- **GPIOx:** GPIO Port

Return values

- **Lock:** status for all pins. Bitx are set to 1 for pinx locked, otherwise 0.

HAL_GPIO_ConfigPinAttributes

Function name

void HAL_GPIO_ConfigPinAttributes (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, uint32_t PinAttributes)

Function description

Configure the GPIO pins attributes.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Pin:** : GPIO_Pin specifies the pin(s) to configure the secure/privilege attribute
- **PinAttributes:** PinAttributes can be one or a combination of the following values :
  - GPIO_PIN_PRIV Privileged-only access
  - GPIO_PIN_NPRIV Privileged/Non-privileged access
  - GPIO_PIN_SEC Secure-only access
  - GPIO_PIN_NSEC Secure/Non-secure access

Return values

- **None.:**

Notes

- Set a pin to secure is only available in secure and privilege Set a pin to privilege is only available in privilege

HAL_GPIO_GetConfigPinAttributes

Function name

HAL_StatusTypeDef HAL_GPIO_GetConfigPinAttributes (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, uint32_t * pPinAttributes)

Function description

Get the GPIO pins attributes.

Parameters

- **GPIOx:** where x can be (A..H and N..Q) to select the GPIO peripheral for STM32N6xx family
- **GPIO_Pin:** specifies the port bit to read. This parameter can be GPIO_PIN_x where x can be (0..15).
- **pPinAttributes:** pPinAttributes pointer to return the pin attributes.

Return values

- **HAL:** Status.

GPIO Exported Macros

__HAL_GPIO_EXTI_GET_RISING_IT

Description:

- Check whether the specified EXTI line is rising edge asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_RISING_IT

Description:

- Clear the EXTI line rising pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_FALLING_IT

Description:

- Check whether the specified EXTI line is falling edge asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_FALLING_IT

Description:

- Clear the EXTI line falling pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_IT

Description:

- Check whether the specified EXTI line is asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_IT

Description:

- Clear the EXTI's line pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GENERATE_SWIT

Description:

- Generate a Software interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_FLAG

Description:

- Check whether the specified EXTI line flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line flag to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_FLAG

Description:

- Clear the EXTI line pending flags.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines flags to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

30 HAL GPU2D Generic Driver

30.1 GPU2D Firmware driver registers structures

30.1.1 GPU2D_HandleTypeDef

GPU2D_HandleTypeDef is defined in the stm32n6xx_hal_gpu2d.h

Data Fields

- ***GPU2D_TypeDef Instance***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_GPU2D_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***GPU2D_TypeDef GPU2D_HandleTypeDef::Instance***
  GPU2D register base address.
- ***HAL_LockTypeDef GPU2D_HandleTypeDef::Lock***
  GPU2D lock.
- ***__IO HAL_GPU2D_StateTypeDef GPU2D_HandleTypeDef::State***
  GPU2D transfer state.
- ***__IO uint32_t GPU2D_HandleTypeDef::ErrorCode***
  GPU2D error code.

30.2 GPU2D Firmware driver API description

The following section lists the various functions of the GPU2D library.

30.2.1 How to use this driver

1. Peripheral control is exclusively done by the accompanying middleware library.

Interrupt mode IO operation

1. Configure the GPU2D hardware to perform graphics operation using the Third Party MW Library APIs.
2. Submit command List to the hardware.
3. Wait indefinitely for the completion of submitted Command List by GPU2D hardware.
4. Use HAL_GPU2D_IRQHandler() called under GPU2D_IRQHandler() interrupt subroutine.
5. At the end of Command List execution HAL_GPU2D_IRQHandler() function is executed and user can add his own function by customization of function pointer
6. CommandListCpltCallback (member of GPU2D handle structure) to notify the upper level about the completion of Command List execution.
7. Callback HAL_GPU2D_CommandListCpltCallback is invoked when the GPU2D hardware executes the programmed command list (Command List execution completion).
   – This callback is called when the compilation defines USE_HAL_GPU2D_REGISTER_CALLBACKS is set to 0 or not defined.
   – This callback should be implemented in the application side. It should notify the upper level that the programmed command list is completed.
8. To control the GPU2D state, use the following function: HAL_GPU2D_GetState().
9. To read the GPU2D error code, use the following function: HAL_GPU2D_GetError().

GPU2D HAL driver macros list

Below the list of most used macros in GPU2D HAL driver :

- __HAL_GPU2D_RESET_HANDLE_STATE: Reset GPU2D handle state.
- __HAL_GPU2D_GET_FLAG: Get the GPU2D pending flags.
- __HAL_GPU2D_CLEAR_FLAG: Clear the GPU2D pending flags.

- __HAL_GPU2D_GET_IT_SOURCE: Check whether the specified GPU2D interrupt is enabled or not.

Callback registration

1. The compilation define USE_HAL_GPU2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_GPU2D_RegisterCallback() to register a user callback.
2. Function HAL_GPU2D_RegisterCallback() allows to register following callbacks:
   – CommandListCpltCallback : callback for Command List completion.
   – MspInitCallback : GPU2D MspInit.
   – MspDeInitCallback : GPU2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function HAL_GPU2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_GPU2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
   – CommandListCpltCallback : callback for Command List completion.
   – MspInitCallback : GPU2D MspInit.
   – MspDeInitCallback : GPU2D MspDeInit.
4. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_GPU2D_RegisterCallback before calling HAL_GPU2D_DeInit or HAL_GPU2D_Init function.
5. When The compilation define USE_HAL_GPU2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

Note: You can refer to the GPU2D HAL driver header file for more useful macros

30.3.1 GPU2D

GPU2D

GPU2D Error Code definition

HAL_GPU2D_ERROR_NONE

No error

HAL_GPU2D_ERROR_TIMEOUT

Timeout error

GPU2D Exported Macros

__HAL_GPU2D_RESET_HANDLE_STATE

Description:

- Reset GPU2D handle state.

Parameters:

- __HANDLE__: specifies the GPU2D handle.

Return value:

- None

__HAL_GPU2D_GET_FLAG

Description:

- Get the GPU2D pending flags.

Parameters:

- __HANDLE__: GPU2D handle
- __FLAG__: flag to check. This parameter can be one of the following values:
  - GPU2D_FLAG_CLC: Command List Complete interrupt mask

Return value:

- The: state of FLAG.

__HAL_GPU2D_CLEAR_FLAG

Description:

- Clear the GPU2D pending flags.

Parameters:

- __HANDLE__: GPU2D handle
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - GPU2D_FLAG_CLC: Command List Complete interrupt mask

Return value:

- None

__HAL_GPU2D_GET_IT_SOURCE

Description:

- Check whether the specified GPU2D interrupt source is enabled or not.

Parameters:

- __HANDLE__: GPU2D handle
- __INTERRUPT__: specifies the GPU2D interrupt source to check. This parameter can be one of the following values:
  - GPU2D_IT_CLC: Command List Complete interrupt mask

Return value:

- The: state of INTERRUPT source.

- ***void(* __HASH_HandleTypeDef::MspInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp Init callback
- ***void(* __HASH_HandleTypeDef::MspDeInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp DeInit callback

31.2 HASH Firmware driver API description

The following section lists the various functions of the HASH library.

31.2.1 How to use this driver

The HASH HAL driver can be used as follows:

1. Initialize the HASH low level resources by implementing the HAL_HASH_MspInit():
   a. Enable the HASH interface clock using __HAL_RCC_HASH_CLK_ENABLE()
   b. When resorting to interrupt-based APIs (e.g. HAL_HASH_Start_IT())
      - Configure the HASH interrupt priority using HAL_NVIC_SetPriority()
      - Enable the HASH IRQ handler using HAL_NVIC_EnableIRQ()
      - In HASH IRQ handler, call HAL_HASH_IRQHandler() API
   c. When resorting to DMA-based APIs (e.g. HAL_HASH_Start_DMA())
      - Enable the DMA interface clock
      - Configure and enable one DMA to manage data transfer from memory to peripheral (input DMA). Managing data transfer from peripheral to memory can be performed only using CPU.
      - Associate the initialized DMA handle to the HASH DMA handle using __HAL_LINKDMA()
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA: use HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()
2. Initialize the HASH HAL using HAL_HASH_Init(). This function:
   a. resorts to HAL_HASH_MspInit() for low-level initialization,
   b. configures the data type: no swap, half word swap, bit swap or byte swap,
   c. configures the Algorithm : MD5, SHA1 or SHA2

3. Three processing schemes are available:
   a. Polling mode: processing APIs are blocking functions i.e. they process the data and wait till the digest computation is finished, e.g. HAL_HASH_Start() for HASH or HAL_HMAC_Start() for HMAC
   b. Interrupt mode: processing APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_HASH_Start_IT() for HASH or HAL_HMAC_Start_IT() for HMAC
   c. DMA mode: processing APIs are not blocking functions and the CPU is not used for data transfer i.e. the data transfer is ensured by DMA, e.g. HAL_HASH_Start_DMA() for HASH or HAL_HMAC_Start_DMA() for HMAC.
4. When the processing function is called after HAL_HASH_Init(), the HASH peripheral is initialized and processes the buffer fed in input. When the input data have all been fed to the Peripheral, the digest computation can start.
5. Multi-buffer processing HASH and HMAC are possible in polling, interrupt and DMA modes.
   a. In polling mode, API HAL_HASH_Accumulate()/HAL_HASH_HMAC_Accumulate() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_AccumulateLast()/ HAL_HASH_HMAC_AccumulateLast() to enter the last one and retrieve as well the computed digest.
   b. In interrupt mode, API HAL_HASH_Accumulate_IT()/HAL_HASH_HMAC_Accumulate_IT() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_AccumulateLast_IT()/ HAL_HASH_HMAC_AccumulateLast_IT() to enter the last one and retrieve as well the computed digest.
   c. In DMA mode, once initialization is done, MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro. From that point, each buffer can be fed to the Peripheral through HAL_HASH_Start_DMA() API for HASH and HAL_HASH_HMAC_Start_DMA() API for HMAC . Before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HASH processing in feeding the last input buffer through the same API HAL_HASH_Start_DMA()for HASH and HAL_HASH_HMAC_Start_DMA() API for HMAC and retrieve as well the computed digest.
6. To use this driver (version 2.0.0) with application developed with old driver (version 1.0.0) user have to:
   a. Add Algorithm as parameter like DataType or KeySize.
   b. Use new API HAL_HASH_Start() for HASH and HAL_HASH_HMAC_Start() for HMAC processing instead of old API like HAL_HASH_SHA1_Start and HAL_HMAC_SHA1_Start.

31.2.2 Detailed description of functions

HAL_HASH_Init

Function name

HAL_StatusTypeDef HAL_HASH_Init (HASH_HandleTypeDef * hhash)

31.3 HASH Firmware driver defines

The following section lists the various define and macros of the module.

31.3.1 HASH

HASH

HASH algorithm selection

HASH_ALGOSELECTION_SHA1

HASH function is SHA1

HASH_ALGOSELECTION_SHA224

HASH function is SHA224

HASH_ALGOSELECTION_SHA256

HASH function is SHA256

HASH_ALGOSELECTION_SHA384

HASH function is SHA384

HASH_ALGOSELECTION_SHA512_224

HASH function is SHA512_224

HASH_ALGOSELECTION_SHA512_256

HASH function is SHA512_256

HASH_ALGOSELECTION_SHA512

HASH function is SHA512

HASH Data Type

HASH_NO_SWAP

32-bit data. No swapping

HASH_HALFWORD_SWAP

16-bit data. Each half word is swapped

HASH_BYTE_SWAP

8-bit data. All bytes are swapped

HASH_BIT_SWAP

1-bit data. In the word all bits are swapped

HASH Error Definition

HAL_HASH_ERROR_NONE

No error

HAL_HASH_ERROR_BUSY

Busy flag error

HAL_HASH_ERROR_DMA

DMA-based process error

HAL_HASH_ERROR_TIMEOUT

Timeout error

HAL_HASH_ERROR_INVALID_CALLBACK

Invalid Callback error

HASH Exported Macros

__HAL_HASH_GET_FLAG

Description:

- Check whether or not the specified HASH flag is set.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete.
  - HASH_FLAG_DMAS DMA interface is enabled (DMAE=1) or a transfer is ongoing.
  - HASH_FLAG_BUSY The hash core is Busy : processing a block of data.
  - HASH_FLAG_DINNE DIN not empty : the input buffer contains at least one word of data.

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_HASH_CLEAR_FLAG

Description:

- Clear the specified HASH flag.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete

Return value:

- None

__HAL_HASH_GET_IT_SOURCE

Description:

- Check whether the specified HASH interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __INTERRUPT__: HASH interrupt source to check This parameter can be one of the following values :
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- State: of interruption (TRUE or FALSE).

__HAL_HASH_ENABLE_IT

Description:

- Enable the specified HASH interrupt.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __INTERRUPT__: specifies the HASH interrupt source to enable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- None

__HAL_HASH_DISABLE_IT

Description:

- Disable the specified HASH interrupt.

Parameters:

- __HANDLE__: specifies the HASH handle.
- __INTERRUPT__: specifies the HASH interrupt source to disable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:

- None

__HAL_HASH_RESET_HANDLE_STATE

Description:

- Reset HASH handle state.

Parameters:

- __HANDLE__: HASH handle.

Return value:

- None

__HAL_HASH_SET_MDMAT

Description:

- Enable the multi-buffer DMA transfer mode.

Return value:

- None

Notes:

- This bit is set when hashing large files when multiple DMA transfers are needed.

__HAL_HASH_RESET_MDMAT

Description:

- Disable the multi-buffer DMA transfer mode.

Return value:

- None

HAL_HASH_VERSION

Description:

- HAL HASH driver version.

Return value:

- None: HAL HASH driver version 2.0.0

HASH flags definitions

HASH_FLAG_DINIS

16 locations are free in the DIN : new block can be entered in the Peripheral

HASH_FLAG_DCIS

Digest calculation complete

HASH_FLAG_DMAS

DMA interface is enabled (DMAE=1) or a transfer is ongoing

HASH_FLAG_BUSY

The hash core is Busy, processing a block of data

HASH_FLAG_DINNE

DIN not empty : input buffer contains at least one word of data

key length only for HMAC mode

HASH_SHORTKEY

HMAC Key size is <= block size (64 or 128 bytes)

HASH_LONGKEY

HMAC Key size is > block size (64 or 128 bytes)

HASH interrupts definitions

HASH_IT_DINI

A new block can be entered into the input buffer (DIN)

HASH_IT_DCI

Digest calculation complete

HASH Mode

HASH_ALGOMODE_HASH

HASH mode

HASH_ALGOMODE_HMAC

HMAC mode

32.2 HCD Firmware driver API description

The following section lists the various functions of the HCD library.

32.2.1 How to use this driver

1. Declare a HCD_HandleTypeDef handle structure, for example: HCD_HandleTypeDef hhcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_HCD_Init() API to initialize the HCD peripheral (Core, Host core, ...)
4. Initialize the HCD low level resources through the HAL_HCD_MspInit() API:
   a. Enable the HCD/USB Low Level interface clock using the following macros
      - __HAL_RCC_USB_OTG_FS_CLK_ENABLE();
      - __HAL_RCC_USB_OTG_HS_CLK_ENABLE(); (For High Speed Mode)
      - __HAL_RCC_USB_OTG_HS_ULPI_CLK_ENABLE(); (For High Speed Mode)
   b. Initialize the related GPIO clocks
   c. Configure HCD pin-out
   d. Configure HCD NVIC interrupt
5. Associate the Upper USB Host stack to the HAL HCD Driver:
   a. hhcd.pData = phost;
6. Enable HCD transmission and reception:
   a. HAL_HCD_Start();

32.2.2 Detailed description of functions

- ***uint32_t GeneralCallMode***
- ***uint32_t NoStretchMode***

Field Documentation

- ***uint32_t I2C_InitTypeDef::Timing***
  Specifies the I2C_TIMINGR_register value. This parameter calculated by referring to I2C initialization section in Reference manual
- ***uint32_t I2C_InitTypeDef::OwnAddress1***
  Specifies the first device own address. This parameter can be a 7-bit or 10-bit address.
- ***uint32_t I2C_InitTypeDef::AddressingMode***
  Specifies if 7-bit or 10-bit addressing mode is selected. This parameter can be a value of ***I2C_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::DualAddressMode***
  Specifies if dual addressing mode is selected. This parameter can be a value of ***I2C_DUAL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::OwnAddress2***
  Specifies the second device own address if dual addressing mode is selected This parameter can be a 7-bit address.
- ***uint32_t I2C_InitTypeDef::OwnAddress2Masks***
  Specifies the acknowledge mask address second device own address if dual addressing mode is selected. This parameter can be a value of ***I2C_OWN_ADDRESS2_MASKS***
- ***uint32_t I2C_InitTypeDef::GeneralCallMode***
  Specifies if general call mode is selected. This parameter can be a value of ***I2C_GENERAL_CALL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::NoStretchMode***
  Specifies if nostretch mode is selected. This parameter can be a value of ***I2C_NOSTRETCH_MODE***

33.1.2 __I2C_HandleTypeDef

__I2C_HandleTypeDef is defined in the stm32n6xx_hal_i2c.h

Data Fields

33.2 I2C Firmware driver API description

The following section lists the various functions of the I2C library.

33.2.1 How to use this driver

The I2C HAL driver can be used as follows:

1. Declare a I2C_HandleTypeDef handle structure, for example: I2C_HandleTypeDef hi2c;
2. Initialize the I2C low level resources by implementing the HAL_I2C_MspInit() API:
   a. Enable the I2Cx interface clock
   b. I2C pins configuration
      - Enable the clock for the I2C GPIOs
      - Configure I2C pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the I2Cx interrupt priority
      - Enable the NVIC I2C IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare a DMA_HandleTypeDef handle structure for the transmit or receive channel
      - Enable the DMAx interface clock using
      - Configure the DMA handle parameters
      - Configure the DMA Tx or Rx channel
      - Associate the initialized DMA handle to the hi2c DMA Tx or Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx or Rx channel

3. Configure the Communication Clock Timing, Own Address1, Master Addressing mode, Dual Addressing mode, Own Address2, Own Address2 Mask, General call and Nostretch mode in the hi2c Init structure.
4. Initialize the I2C registers by calling the HAL_I2C_Init(), configures also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL_I2C_MspInit(&hi2c) API.
5. To check if target device is ready for communication, use the function HAL_I2C_IsDeviceReady()
6. For I2C IO and IO MEM operations, three operation modes are available within this driver :

Polling mode IO operation

- Transmit in master mode an amount of data in blocking mode using HAL_I2C_Master_Transmit()
- Receive in master mode an amount of data in blocking mode using HAL_I2C_Master_Receive()
- Transmit in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Transmit()
- Receive in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Receive()

Polling mode IO MEM operation

- Write an amount of data in blocking mode to a specific memory address using HAL_I2C_Mem_Write()
- Read an amount of data in blocking mode from a specific memory address using HAL_I2C_Mem_Read()

Interrupt mode IO operation

- Transmit in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Transmit_IT()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
- Receive in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Receive_IT()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Transmit_IT()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Receive_IT()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master or memory I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode or DMA mode IO sequential operation

Note: These interfaces allow to manage a sequential transfer with a repeated start condition when a direction change during transfer

- A specific option field manage the different steps of a sequential transfer

- Option field values are defined through I2C_XFEROPTIONS and are listed below:
  - I2C_FIRST_AND_LAST_FRAME: No sequential usage, functional is same as associated interfaces in no sequential mode
  - I2C_FIRST_FRAME: Sequential usage, this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition
  - I2C_FIRST_AND_NEXT_FRAME: Sequential usage (Master only), this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition, an then permit a call the same master sequential interface several times (like HAL_I2C_Master_Seq_Transmit_IT() then HAL_I2C_Master_Seq_Transmit_IT() or HAL_I2C_Master_Seq_Transmit_DMA() then HAL_I2C_Master_Seq_Transmit_DMA())
  - I2C_NEXT_FRAME: Sequential usage, this option allow to manage a sequence with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and without a final stop condition in both cases
  - I2C_LAST_FRAME: Sequential usage, this option allow to manage a sequance with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and with a final stop condition in both cases
  - I2C_LAST_FRAME_NO_STOP: Sequential usage (Master only), this option allow to manage a restart condition after several call of the same master sequential interface several times (link with option I2C_FIRST_AND_NEXT_FRAME). Usage can, transfer several bytes one by one using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_AND_NEXT_FRAME then I2C_NEXT_FRAME. Then usage of this option I2C_LAST_FRAME_NO_STOP at the last Transmit or Receive sequence permit to call the opposite interface Receive or Transmit without stopping the communication and so generate a restart condition.
  - I2C_OTHER_FRAME: Sequential usage (Master only), this option allow to manage a restart condition after each call of the same master sequential interface. Usage can, transfer several bytes one by one with a restart with slave address between each bytes using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_FRAME then I2C_OTHER_FRAME. Then usage of this option I2C_OTHER_AND_LAST_FRAME at the last frame to help automatic generation of STOP condition.

- Different sequential I2C interfaces are listed below:
  - Sequential transmit in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Transmit_IT() or using HAL_I2C_Master_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
  - Sequential receive in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Receive_IT() or using HAL_I2C_Master_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
  - Abort a master or memory IT or DMA I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
    - End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
  - Enable/disable the Address listen mode in slave I2C mode using HAL_I2C_EnableListen_IT() HAL_I2C_DisableListen_IT()
    - When address slave I2C match, HAL_I2C_AddrCallback() is executed and users can add their own code to check the Address Match Code and the transmission direction request by master (Write/Read).
    - At Listen mode end HAL_I2C_ListenCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_ListenCpltCallback()
  - Sequential transmit in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Transmit_IT() or using HAL_I2C_Slave_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
  - Sequential receive in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Receive_IT() or using HAL_I2C_Slave_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
  - In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
  - Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode IO MEM operation

- Write an amount of data in non-blocking mode with Interrupt to a specific memory address using HAL_I2C_Mem_Write_IT()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with Interrupt from a specific memory address using HAL_I2C_Mem_Read_IT()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

DMA mode IO operation

- Transmit in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()

- Receive in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Receive_DMA()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Receive_DMA()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master or memory I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

DMA mode IO MEM operation

- Write an amount of data in non-blocking mode with DMA to a specific memory address using HAL_I2C_Mem_Write_DMA()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with DMA from a specific memory address using HAL_I2C_Mem_Read_DMA()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

I2C HAL driver macros list

Below the list of most used macros in I2C HAL driver.

- __HAL_I2C_ENABLE: Enable the I2C peripheral
- __HAL_I2C_DISABLE: Disable the I2C peripheral
- __HAL_I2C_GENERATE_NACK: Generate a Non-Acknowledge I2C peripheral in Slave mode
- __HAL_I2C_GET_FLAG: Check whether the specified I2C flag is set or not
- __HAL_I2C_CLEAR_FLAG: Clear the specified I2C pending flag
- __HAL_I2C_ENABLE_IT: Enable the specified I2C interrupt
- __HAL_I2C_DISABLE_IT: Disable the specified I2C interrupt

Callback registration

The compilation flag USE_HAL_I2C_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2C_RegisterCallback() or HAL_I2C_RegisterAddrCallback() to register an interrupt callback.

Function HAL_I2C_RegisterCallback() allows to register following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.

- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific callback AddrCallback use dedicated register callbacks : HAL_I2C_RegisterAddrCallback().

Use function HAL_I2C_UnRegisterCallback to reset a callback to the default weak function. HAL_I2C_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.
- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

For callback AddrCallback use dedicated register callbacks : HAL_I2C_UnRegisterAddrCallback().

By default, after the HAL_I2C_Init() and when the state is HAL_I2C_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2C_MasterTxCpltCallback(), HAL_I2C_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2C_Init()/ HAL_I2C_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2C_Init()/ HAL_I2C_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_I2C_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_I2C_STATE_READY or HAL_I2C_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2C_RegisterCallback() before calling HAL_I2C_DeInit() or HAL_I2C_Init() function.

When the compilation flag USE_HAL_I2C_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Note: You can refer to the I2C HAL driver header file for more useful macros

33.2.2 Detailed description of functions

HAL_I2C_Init

Function name

HAL_StatusTypeDef HAL_I2C_Init (I2C_HandleTypeDef * hi2c)

33.3 I2C Firmware driver defines

The following section lists the various define and macros of the module.

33.3.1 I2C

I2C

I2C Addressing Mode

I2C_ADDRESSINGMODE_7BIT

I2C_ADDRESSINGMODE_10BIT

I2C Dual Addressing Mode

I2C_DUALADDRESS_DISABLE

I2C_DUALADDRESS_ENABLE

I2C Error Code definition

HAL_I2C_ERROR_NONE
: No error

HAL_I2C_ERROR_BERR
: BERR error

HAL_I2C_ERROR_ARLO
: ARLO error

HAL_I2C_ERROR_AF
: ACKF error

HAL_I2C_ERROR_OVR
: OVR error

HAL_I2C_ERROR_DMA
: DMA transfer error

HAL_I2C_ERROR_TIMEOUT
: Timeout error

HAL_I2C_ERROR_SIZE
: Size Management error

HAL_I2C_ERROR_DMA_PARAM
: DMA Parameter Error

HAL_I2C_ERROR_INVALID_CALLBACK
: Invalid Callback error

HAL_I2C_ERROR_INVALID_PARAM
: Invalid Parameters error

I2C Exported Macros

__HAL_I2C_RESET_HANDLE_STATE

Description:

- Reset I2C handle state.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_ENABLE_IT

Description:

- Enable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_DISABLE_IT

Description:

- Disable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_GET_IT_SOURCE

Description:

- Check whether the specified I2C interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the I2C interrupt source to check. This parameter can be one of the following values:
  - I2C_IT_ERRI Errors interrupt enable
  - I2C_IT_TCI Transfer complete interrupt enable
  - I2C_IT_STOPI STOP detection interrupt enable
  - I2C_IT_NACKI NACK received interrupt enable
  - I2C_IT_ADDRI Address match interrupt enable
  - I2C_IT_RXI RX interrupt enable
  - I2C_IT_TXI TX interrupt enable

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

I2C_FLAG_MASK

Description:

- Check whether the specified I2C flag is set or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_TXIS Transmit interrupt status
  - I2C_FLAG_RXNE Receive data register not empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_TC Transfer complete (master mode)
  - I2C_FLAG_TCR Transfer complete reload
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert
  - I2C_FLAG_BUSY Bus busy
  - I2C_FLAG_DIR Transfer direction (slave mode)

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_I2C_GET_FLAG

__HAL_I2C_CLEAR_FLAG

Description:

- Clear the I2C pending flags which are cleared by writing 1 in a specific bit.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert

Return value:

- None

__HAL_I2C_ENABLE

Description:

- Enable the specified I2C peripheral.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_DISABLE

Description:

- Disable the specified I2C peripheral.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_GENERATE_NACK

Description:

- Generate a Non-Acknowledge I2C peripheral in Slave mode.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

34 HAL I2C Extension Driver

34.1 I2CEx Firmware driver API description

The following section lists the various functions of the I2CEx library.

34.1.1 I2C peripheral Extended features

Comparing to other previous devices, the I2C interface for STM32N6xx devices contains the following additional features

- Possibility to disable or enable Analog Noise Filter
- Use of a configured Digital Noise Filter
- Disable or enable wakeup from Stop mode(s)
- Disable or enable Fast Mode Plus

34.1.2 How to use this driver

This driver provides functions to configure Noise Filter and Wake Up Feature

1. Configure I2C Analog noise filter using the function HAL_I2CEx_ConfigAnalogFilter()
2. Configure I2C Digital noise filter using the function HAL_I2CEx_ConfigDigitalFilter()
3. Configure the enable or disable of I2C Wake Up Mode using the functions :
   - HAL_I2CEx_EnableWakeUp()
   - HAL_I2CEx_DisableWakeUp()
4. Configure the enable or disable of fast mode plus driving capability using the functions :
   - HAL_I2CEx_ConfigFastModePlus()

34.1.3 Detailed description of functions

HAL_I2CEx_ConfigAnalogFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigAnalogFilter (I2C_HandleTypeDef * hi2c, uint32_t AnalogFilter)

Function description

HAL_I2CEx_ConfigDigitalFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigDigitalFilter (I2C_HandleTypeDef * hi2c, uint32_t DigitalFilter)

Function description

HAL_I2CEx_EnableWakeUp

Function name

HAL_StatusTypeDef HAL_I2CEx_EnableWakeUp (I2C_HandleTypeDef * hi2c)

Function description

HAL_I2CEx_DisableWakeUp

35 HAL I2S Generic Driver

35.1 I2S Firmware driver registers structures

35.1.1 I2S_InitTypeDef

I2S_InitTypeDef is defined in the stm32n6xx_hal_i2s.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t Standard***
- ***uint32_t DataFormat***
- ***uint32_t MCLKOutput***
- ***uint32_t AudioFreq***
- ***uint32_t CPOL***
- ***uint32_t FirstBit***
- ***uint32_t WSInversion***
- ***uint32_t Data24BitAlignment***
- ***uint32_t MasterKeepIOState***

Field Documentation

- ***uint32_t I2S_InitTypeDef::Mode***
  Specifies the I2S operating mode. This parameter can be a value of ***I2S_Mode***
- ***uint32_t I2S_InitTypeDef::Standard***
  Specifies the standard used for the I2S communication. This parameter can be a value of ***I2S_Standard***
- ***uint32_t I2S_InitTypeDef::DataFormat***
  Specifies the data format for the I2S communication. This parameter can be a value of ***I2S_Data_Format***
- ***uint32_t I2S_InitTypeDef::MCLKOutput***
  Specifies whether the I2S MCLK output is enabled or not. This parameter can be a value of ***I2S_MCLK_Output***
- ***uint32_t I2S_InitTypeDef::AudioFreq***
  Specifies the frequency selected for the I2S communication. This parameter can be a value of ***I2S_Audio_Frequency***
- ***uint32_t I2S_InitTypeDef::CPOL***
  Specifies the idle state of the I2S clock. This parameter can be a value of ***I2S_Clock_Polarity***
- ***uint32_t I2S_InitTypeDef::FirstBit***
  Specifies whether data transfers start from MSB or LSB bit. This parameter can be a value of ***I2S_MSB_LSB_Transmission***
- ***uint32_t I2S_InitTypeDef::WSInversion***
  Control the Word Select Inversion. This parameter can be a value of ***I2S_WSInversion***
- ***uint32_t I2S_InitTypeDef::Data24BitAlignment***
  Specifies the Data Padding for 24 bits data length This parameter can be a value of ***I2S_Data_24Bit_Alignment***
- ***uint32_t I2S_InitTypeDef::MasterKeepIOState***
  Control of Alternate function GPIOs state This parameter can be a value of ***I2S_Master_Keep_IO_State***

  I2S Msp DeInit callback

35.2 I2S Firmware driver API description

The following section lists the various functions of the I2S library.

35.2.1 How to use this driver

The I2S HAL driver can be used as follow:

1. Declare a I2S_HandleTypeDef handle structure.
2. Initialize the I2S low level resources by implement the HAL_I2S_MspInit() API:
   a. Enable the SPIx interface clock.
   b. I2S pins configuration:
      - Enable the clock for the I2S GPIOs.
      - Configure these I2S pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_I2S_Transmit_IT() and HAL_I2S_Receive_IT() APIs).
      - Configure the I2Sx interrupt priority.
      - Enable the NVIC I2S IRQ handle.
   d. DMA Configuration if you need to use DMA process (HAL_I2S_Transmit_DMA() and HAL_I2S_Receive_DMA() APIs:
      - Declare a DMA handle structure for the Tx/Rx Stream/Channel.
      - Enable the DMAx interface clock.
      - Configure the declared DMA handle structure with the required Tx/Rx parameters.
      - Configure the DMA Tx/Rx Stream/Channel.
      - Associate the initialized DMA handle to the I2S DMA Tx/Rx handle.
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx Stream/Channel.
3. Program the Mode, Standard, Data Format, MCLK Output, Audio frequency and Polarity using HAL_I2S_Init() function.

Note: The specific I2S interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_I2S_ENABLE_IT() and __HAL_I2S_DISABLE_IT() inside the transmit and receive process.

– *External clock source is configured after setting correctly the define constant EXTERNAL_CLOCK_VALUE in the stm32n6xx_hal_conf.h file.*

4. Three mode of operations are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_I2S_Transmit()

- Receive an amount of data in blocking mode using HAL_I2S_Receive()

Interrupt mode IO operation

- Send an amount of data in non blocking mode using HAL_I2S_Transmit_IT()
- At transmission end of half transfer HAL_I2S_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxHalfCpltCallback
- At transmission end of transfer HAL_I2S_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxCpltCallback
- Receive an amount of data in non blocking mode using HAL_I2S_Receive_IT()
- At reception end of half transfer HAL_I2S_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxHalfCpltCallback
- At reception end of transfer HAL_I2S_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxCpltCallback
- In case of transfer Error, HAL_I2S_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_I2S_ErrorCallback

DMA mode IO operation

- Send an amount of data in non blocking mode (DMA) using HAL_I2S_Transmit_DMA()
- At transmission end of half transfer HAL_I2S_TxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxHalfCpltCallback
- At transmission end of transfer HAL_I2S_TxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_TxCpltCallback
- Receive an amount of data in non blocking mode (DMA) using HAL_I2S_Receive_DMA()
- At reception end of half transfer HAL_I2S_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxHalfCpltCallback
- At reception end of transfer HAL_I2S_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_I2S_RxCpltCallback
- In case of transfer Error, HAL_I2S_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_I2S_ErrorCallback
- Pause the DMA Transfer using HAL_I2S_DMAPause()
- Resume the DMA Transfer using HAL_I2S_DMAResume()
- Stop the DMA Transfer using HAL_I2S_DMAStop()

I2S HAL driver macros list

Below the list of most used macros in I2S HAL driver.

- __HAL_I2S_ENABLE: Enable the specified SPI peripheral (in I2S mode)
- __HAL_I2S_DISABLE: Disable the specified SPI peripheral (in I2S mode)
- __HAL_I2S_ENABLE_IT : Enable the specified I2S interrupts
- __HAL_I2S_DISABLE_IT : Disable the specified I2S interrupts
- __HAL_I2S_GET_FLAG: Check whether the specified I2S flag is set or not

Note: You can refer to the I2S HAL driver header file for more useful macros

I2S HAL driver macros list

Callback registration:

1. The compilation flag USE_HAL_I2S_REGISTER_CALLBACKS when set to 1UL allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2S_RegisterCallback() to register an interrupt callback.

2. Function HAL_I2S_RegisterCallback() allows to register following callbacks.
   - TxCpltCallback : I2S Tx Completed callback
   - RxCpltCallback : I2S Rx Completed callback
   - TxRxCpltCallback : I2S TxRx Completed callback
   - TxHalfCpltCallback : I2S Tx Half Completed callback
   - RxHalfCpltCallback : I2S Rx Half Completed callback
   - TxRxHalfCpltCallback : I2S TxRx Half Completed callback
   - ErrorCallback : I2S Error callback
   - MspInitCallback : I2S Msp Init callback
   - MspDeInitCallback : I2S Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function HAL_I2S_UnRegisterCallback to reset a callback to the default weak function. HAL_I2S_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
   - TxCpltCallback : I2S Tx Completed callback
   - RxCpltCallback : I2S Rx Completed callback
   - TxRxCpltCallback : I2S TxRx Completed callback
   - TxHalfCpltCallback : I2S Tx Half Completed callback
   - RxHalfCpltCallback : I2S Rx Half Completed callback
   - TxRxHalfCpltCallback : I2S TxRx Half Completed callback
   - ErrorCallback : I2S Error callback
   - MspInitCallback : I2S Msp Init callback
   - MspDeInitCallback : I2S Msp DeInit callback
4. By default, after the HAL_I2S_Init() and when the state is HAL_I2S_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2S_MasterTxCpltCallback(), HAL_I2S_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2S_Init()/ HAL_I2S_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2S_Init()/ HAL_I2S_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.
5. Callbacks can be registered/unregistered in HAL_I2S_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_I2S_STATE_READY or HAL_I2S_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2S_RegisterCallback() before calling HAL_I2S_DeInit() or HAL_I2S_Init() function.
6. When The compilation define USE_HAL_I2S_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

35.2.2 Detailed description of functions

HAL_I2S_Init

Function name

HAL_StatusTypeDef HAL_I2S_Init (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_DeInit

Function name

HAL_StatusTypeDef HAL_I2S_DeInit (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_MspInit

Function name

void HAL_I2S_MspInit (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_MspDeInit

Function name

void HAL_I2S_MspDeInit (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I2S_RegisterCallback (I2S_HandleTypeDef * hi2s, HAL_I2S_CallbackIDTypeDef CallbackID, pI2S_CallbackTypeDef pCallback)

Function description

HAL_I2S_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I2S_UnRegisterCallback (I2S_HandleTypeDef * hi2s, HAL_I2S_CallbackIDTypeDef CallbackID)

Function description

HAL_I2S_Transmit

Function name

HAL_StatusTypeDef HAL_I2S_Transmit (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size, uint32_t Timeout)

Function description

HAL_I2S_Receive

Function name

HAL_StatusTypeDef HAL_I2S_Receive (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size, uint32_t Timeout)

Function description

HAL_I2SEx_TransmitReceive

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size, uint32_t Timeout)

Function description

HAL_I2S_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2S_Transmit_IT (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size)

Function description

HAL_I2S_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2S_Receive_IT (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size)

Function description

HAL_I2SEx_TransmitReceive_IT

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive_IT (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)

Function description

HAL_I2S_IRQHandler

Function name

void HAL_I2S_IRQHandler (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2S_Transmit_DMA (I2S_HandleTypeDef * hi2s, const uint16_t * pData, uint16_t Size)

Function description

HAL_I2S_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2S_Receive_DMA (I2S_HandleTypeDef * hi2s, uint16_t * pData, uint16_t Size)

Function description

HAL_I2SEx_TransmitReceive_DMA

Function name

HAL_StatusTypeDef HAL_I2SEx_TransmitReceive_DMA (I2S_HandleTypeDef * hi2s, const uint16_t * pTxData, uint16_t * pRxData, uint16_t Size)

Function description

HAL_I2S_DMAPause

Function name

HAL_StatusTypeDef HAL_I2S_DMAPause (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_DMAResume

Function name

HAL_StatusTypeDef HAL_I2S_DMAResume (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_DMAStop

Function name

HAL_StatusTypeDef HAL_I2S_DMAStop (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_TxHalfCpltCallback

Function name

void HAL_I2S_TxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_TxCpltCallback

Function name

void HAL_I2S_TxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_RxHalfCpltCallback

Function name

void HAL_I2S_RxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_RxCpltCallback

Function name

void HAL_I2S_RxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2SEx_TxRxHalfCpltCallback

Function name

void HAL_I2SEx_TxRxHalfCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2SEx_TxRxCpltCallback

Function name

void HAL_I2SEx_TxRxCpltCallback (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_ErrorCallback

Function name

void HAL_I2S_ErrorCallback (I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_GetState

Function name

HAL_I2S_StateTypeDef HAL_I2S_GetState (const I2S_HandleTypeDef * hi2s)

Function description

HAL_I2S_GetError

Function name

uint32_t HAL_I2S_GetError (const I2S_HandleTypeDef * hi2s)

Function description

35.3 I2S Firmware driver defines

The following section lists the various define and macros of the module.

35.3.1 I2S

I2S

I2S Audio Frequency

I2S_AUDIOFREQ_192K

I2S_AUDIOFREQ_96K

I2S_AUDIOFREQ_48K

I2S_AUDIOFREQ_44K

I2S_AUDIOFREQ_32K

I2S_AUDIOFREQ_22K

I2S_AUDIOFREQ_16K

I2S_AUDIOFREQ_11K

I2S_AUDIOFREQ_8K

I2S_AUDIOFREQ_DEFAULT

I2S FullDuplex Mode

I2S_CPOL_LOW

I2S_CPOL_HIGH

Data Padding 24Bit

I2S_DATA_24BIT_ALIGNMENT_RIGHT

I2S_DATA_24BIT_ALIGNMENT_LEFT

I2S Data Format

I2S_DATAFORMAT_16B

I2S_DATAFORMAT_16B_EXTENDED

I2S_DATAFORMAT_24B

I2S_DATAFORMAT_32B

I2S Error

HAL_I2S_ERROR_NONE

No error

HAL_I2S_ERROR_TIMEOUT

Timeout error

HAL_I2S_ERROR_OVR

OVR error

HAL_I2S_ERROR_UDR

UDR error

HAL_I2S_ERROR_DMA

DMA transfer error

HAL_I2S_ERROR_PRESCALER

Prescaler Calculation error

HAL_I2S_ERROR_FRE

FRE error

HAL_I2S_ERROR_NO_OGT

No On Going Transfer error

HAL_I2S_ERROR_NOT_SUPPORTED

Requested operation not supported

HAL_I2S_ERROR_INVALID_CALLBACK

Invalid Callback error

I2S Exported Macros

__HAL_I2S_RESET_HANDLE_STATE

Description:

- Reset I2S handle state.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_ENABLE

Description:

- Enable the specified SPI peripheral (in I2S mode).

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_DISABLE

Description:

- Disable the specified SPI peripheral (in I2S mode).

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_ENABLE_IT

Description:

- Enable the specified I2S interrupts.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- None

__HAL_I2S_DISABLE_IT

Description:

- Disable the specified I2S interrupts.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- None

__HAL_I2S_GET_IT_SOURCE

Description:

- Check if the specified I2S interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __INTERRUPT__: specifies the I2S interrupt source to check. This parameter can be one of the following values:
  - I2S_IT_RXP : Rx-Packet available interrupt
  - I2S_IT_TXP : Tx-Packet space available interrupt
  - I2S_IT_DXP : Tx-Packet space available interrupt
  - I2S_IT_UDR : Underrun interrupt
  - I2S_IT_OVR : Overrun interrupt
  - I2S_IT_FRE : TI mode frame format error interrupt
  - I2S_IT_ERR : Error interrupt enable

Return value:

- The: new state of __IT__ (TRUE or FALSE).

__HAL_I2S_GET_FLAG

Description:

- Check whether the specified I2S flag is set or not.

Parameters:

- __HANDLE__: specifies the I2S Handle. This parameter can be I2S where x: 1, 2 or 3 to select the I2S peripheral.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - I2S_FLAG_RXP : Rx-Packet available flag
  - I2S_FLAG_TXP : Tx-Packet space available flag
  - I2S_FLAG_UDR : Underrun flag
  - I2S_FLAG_OVR : Overrun flag
  - I2S_FLAG_FRE : TI mode frame format error flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_I2S_CLEAR_OVRFLAG

Description:

- Clear the I2S OVR pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_CLEAR_UDRFLAG

Description:

- Clear the I2S UDR pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

__HAL_I2S_CLEAR_TIFREFLAG

Description:

- Clear the I2S FRE pending flag.

Parameters:

- __HANDLE__: specifies the I2S Handle.

Return value:

- None

36 HAL I3C Generic Driver

36.1 I3C Firmware driver registers structures

36.1.1 I3C_InitTypeDef

I3C_InitTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***LL_I3C_CtrlBusConfTypeDef CtrlBusCharacteristic***
- ***LL_I3C_TgtBusConfTypeDef TgtBusCharacteristic***

Field Documentation

- ***LL_I3C_CtrlBusConfTypeDef I3C_InitTypeDef::CtrlBusCharacteristic***
  Specifies the I3C controller bus characteristic configuration when Controller mode
- ***LL_I3C_TgtBusConfTypeDef I3C_InitTypeDef::TgtBusCharacteristic***
  Specifies the I3C target bus characteristic configuration when Target mode

36.1.2 I3C_FifoConfTypeDef

I3C_FifoConfTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint32_t RxFifoThreshold***
- ***uint32_t TxFifoThreshold***
- ***uint32_t ControlFifo***
- ***uint32_t StatusFifo***

Field Documentation

- ***uint32_t I3C_FifoConfTypeDef::RxFifoThreshold***
  Specifies the I3C Rx FIFO threshold level. This parameter must be a value of ***I3C_RX_FIFO_THRESHOLD***
- ***uint32_t I3C_FifoConfTypeDef::TxFifoThreshold***
  Specifies the I3C Tx FIFO threshold level. This parameter must be a value of ***I3C_TX_FIFO_THRESHOLD***
- ***uint32_t I3C_FifoConfTypeDef::ControlFifo***
  Specifies the I3C control FIFO enable/disable state. This parameter is configured only with controller mode and it must be a value of ***I3C_CONTROL_FIFO_STATE***
- ***uint32_t I3C_FifoConfTypeDef::StatusFifo***
  Specifies the I3C status FIFO enable/disable state. This parameter is configured only with controller mode and it must be a value of ***I3C_STATUS_FIFO_STATE***

36.1.3 I3C_CtrlConfTypeDef

I3C_CtrlConfTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint8_t DynamicAddr***
- ***uint8_t StallTime***
- ***FunctionalState HotJoinAllowed***
- ***FunctionalState ACKStallState***
- ***FunctionalState CCCStallState***
- ***FunctionalState TxStallState***
- ***FunctionalState RxStallState***
- ***FunctionalState HighKeeperSDA***

Field Documentation

- ***uint8_t I3C_CtrlConfTypeDef::DynamicAddr***
  Specifies the dynamic address of the controller when goes in target mode. This parameter must be a number between Min_Data=0x00 and Max_Data=0x7F

- ***uint8_t I3C_CtrlConfTypeDef::StallTime***
  Specifies the controller clock stall time in number of kernel clock cycles. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF
- ***FunctionalState I3C_CtrlConfTypeDef::HotJoinAllowed***
  Specifies the Enable/Disable state of the controller Hot Join acknowledgement when receiving a hot join request from target. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::ACKStallState***
  Specifies the Enable/Disable state of the controller clock stall on the ACK phase. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::CCCStallState***
  Specifies the Enable/Disable state of the controller clock stall on the T bit phase of a CCC communication to allow the target to decode command. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::TxStallState***
  Specifies the Enable/Disable state of the controller clock stall on parity phase of data to allow the target to read received data. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::RxStallState***
  Specifies the Enable/Disable state of the controller clock stall on the T bit phase of data enable to allow the target to prepare data to be sent. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_CtrlConfTypeDef::HighKeeperSDA***
  Specifies the Enable/Disable state of the controller SDA high keeper. This parameter can be set to ENABLE or DISABLE

36.1.4 I3C_TgtConfTypeDef

I3C_TgtConfTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint8_t Identifier***
- ***uint8_t MIPIIdentifier***
- ***FunctionalState CtrlRoleRequest***
- ***FunctionalState HotJoinRequest***
- ***FunctionalState IBIRequest***
- ***FunctionalState IBIPayload***
- ***uint32_t IBIPayloadSize***
- ***uint16_t MaxReadDataSize***
- ***uint16_t MaxWriteDataSize***
- ***FunctionalState CtrlCapability***
- ***FunctionalState GroupAddrCapability***
- ***uint32_t DataTurnAroundDuration***
- ***uint8_t MaxReadTurnAround***
- ***uint32_t MaxDataSpeed***
- ***FunctionalState MaxSpeedLimitation***
- ***uint32_t HandOffActivityState***
- ***FunctionalState HandOffDelay***
- ***FunctionalState PendingReadMDB***

Field Documentation

- ***uint8_t I3C_TgtConfTypeDef::Identifier***
  Specifies the target characteristic ID (MIPI named reference DCR). This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF
- ***uint8_t I3C_TgtConfTypeDef::MIPIIdentifier***
  Specifies the bits [12-15] of the 48-provisioned ID (MIPI named reference PID), other 48-provisioned ID are hardcoded. This parameter must be a number between Min_Data=0x00 and Max_Data=0x0F
- ***FunctionalState I3C_TgtConfTypeDef::CtrlRoleRequest***
  Specifies the Enable/Disable state of the target authorization request for a second master Chip. This parameter can be set to ENABLE or DISABLE

- ***FunctionalState I3C_TgtConfTypeDef::HotJoinRequest***
  Specifies the Enable/Disable state of the target hot join authorization request. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::IBIRequest***
  Specifies the Enable/Disable state of the target in Band Interrupt authorization request. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::IBIPayload***
  Specifies the Enable/Disable state of sending data payload after an accepted IBI. This parameter can be set to ENABLE or DISABLE
- ***uint32_t I3C_TgtConfTypeDef::IBIPayloadSize***
  Specifies the I3C target payload data size. This parameter must be a value of ***I3C_PAYLOAD_SIZE***
- ***uint16_t I3C_TgtConfTypeDef::MaxReadDataSize***
  Specifies the numbers of data bytes that the target can read at maximum. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFFFF
- ***uint16_t I3C_TgtConfTypeDef::MaxWriteDataSize***
  Specifies the numbers of data bytes that the target can write at maximum. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFFFF
- ***FunctionalState I3C_TgtConfTypeDef::CtrlCapability***
  Specifies the Enable/Disable state of the target controller capability. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::GroupAddrCapability***
  Specifies the Enable/Disable state of the target support of group address after a controller role hand-off. This parameter can be set to ENABLE or DISABLE
- ***uint32_t I3C_TgtConfTypeDef::DataTurnAroundDuration***
  Specifies the I3C target clock-to-data turnaround time. This parameter must be a value of ***I3C_TURNAROUND_TIME_TSCO***
- ***uint8_t I3C_TgtConfTypeDef::MaxReadTurnAround***
  Specifies the target maximum read turnaround byte. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF
- ***uint32_t I3C_TgtConfTypeDef::MaxDataSpeed***
  Specifies the I3C target returned GETMXDS CCC format. This parameter must be a value of ***I3C_GETMXDS_FORMAT***
- ***FunctionalState I3C_TgtConfTypeDef::MaxSpeedLimitation***
  Specifies the Enable/Disable state of the target max data speed limitation. This parameter can be set to ENABLE or DISABLE
- ***uint32_t I3C_TgtConfTypeDef::HandOffActivityState***
  Specifies the I3C target activity state when becoming controller. This parameter must be a value of ***I3C_HANDOFF_ACTIVITY_STATE***
- ***FunctionalState I3C_TgtConfTypeDef::HandOffDelay***
  Specifies the Enable/Disable state of the target need of delay to process the controller role hand-off. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_TgtConfTypeDef::PendingReadMDB***
  Specifies the Enable/Disable state of the transmission of a mandatory data bytes indicating a pending read notification for GETCAPR CCC command. This parameter can be set to ENABLE or DISABLE

36.1.5 I3C_DeviceConfTypeDef

I3C_DeviceConfTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint8_t DeviceIndex***
- ***uint8_t TargetDynamicAddr***
- ***FunctionalState IBIAck***
- ***FunctionalState IBIPayload***
- ***FunctionalState CtrlRoleReqAck***
- ***FunctionalState CtrlStopTransfer***

Field Documentation

- ***uint8_t I3C_DeviceConfTypeDef::DeviceIndex***
  Specifies the index value of the device in the DEVRx register. This parameter must be a number between Min_Data=1 and Max_Data=4
- ***uint8_t I3C_DeviceConfTypeDef::TargetDynamicAddr***
  Specifies the dynamic address of the target x (1 to 4) connected on the bus. This parameter must be a number between Min_Data=0x00 and Max_Data=0x7F
- ***FunctionalState I3C_DeviceConfTypeDef::IBIAck***
  Specifies the Enable/Disable state of the controller's ACK when receiving an IBI from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_DeviceConfTypeDef::IBIPayload***
  Specifies the Enable/Disable state of the controller's receiving IBI payload after acknowledging an IBI requested from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_DeviceConfTypeDef::CtrlRoleReqAck***
  Specifies the Enable/Disable state of the controller's ACK when receiving a control request from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState I3C_DeviceConfTypeDef::CtrlStopTransfer***
  Specifies the Enable/Disable state of the controller's stop transfer after receiving an IBI request from a target x (1 to 4) connected on the bus. This parameter can be set to ENABLE or DISABLE

36.1.6 I3C_CCCInfoTypeDef

I3C_CCCInfoTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint32_t DynamicAddrValid***
- ***uint32_t DynamicAddr***
- ***uint32_t MaxWriteLength***
- ***uint32_t MaxReadLength***
- ***uint32_t ResetAction***
- ***uint32_t ActivityState***
- ***uint32_t HotJoinAllowed***
- ***uint32_t InBandAllowed***
- ***uint32_t CtrlRoleAllowed***
- ***uint32_t IBICRTgtAddr***
- ***uint32_t IBITgtNbPayload***
- ***uint32_t IBITgtPayload***

Field Documentation

- ***uint32_t I3C_CCCInfoTypeDef::DynamicAddrValid***
  I3C target Dynamic Address Valid (updated during ENTDAA/RSTDAA/SETNEWDA CCC) This parameter can be Valid=1U or Not Valid=0U
- ***uint32_t I3C_CCCInfoTypeDef::DynamicAddr***
  I3C target Dynamic Address (updated during ENTDAA/RSTDAA/SETNEWDA CCC)
- ***uint32_t I3C_CCCInfoTypeDef::MaxWriteLength***
  I3C target Maximum Write Length (updated during SETMWL CCC)
- ***uint32_t I3C_CCCInfoTypeDef::MaxReadLength***
  I3C target Maximum Read Length (updated during SETMRL CCC)
- ***uint32_t I3C_CCCInfoTypeDef::ResetAction***
  I3C target Reset Action level (updated during RSTACT CCC)
- ***uint32_t I3C_CCCInfoTypeDef::ActivityState***
  I3C target Activity State (updated during ENTASx CCC)
- ***uint32_t I3C_CCCInfoTypeDef::HotJoinAllowed***
  I3C target Hot Join (updated during ENEC/DISEC CCC) This parameter can be Allowed=1U or Not Allowed=0U
- ***uint32_t I3C_CCCInfoTypeDef::InBandAllowed***
  I3C target In Band Interrupt (updated during ENEC/DISEC CCC) This parameter can be Allowed=1U or Not Allowed=0U

- ***uint32_t I3C_CCCInfoTypeDef::CtrlRoleAllowed***
  I3C target Controller Role Request (updated during ENEC/DISEC CCC) This parameter can be Allowed=1U or Not Allowed=0U
- ***uint32_t I3C_CCCInfoTypeDef::IBICRTgtAddr***
  I3C controller receive Target Address during IBI or Controller Role Request event
- ***uint32_t I3C_CCCInfoTypeDef::IBITgtNbPayload***
  I3C controller get Number of Data Payload after an IBI event
- ***uint32_t I3C_CCCInfoTypeDef::IBITgtPayload***
  I3C controller receive IBI Payload after an IBI event

36.1.7 I3C_ControlTypeDef

I3C_ControlTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint32_t * pBuffer***
- ***uint32_t Size***

Field Documentation

- ***uint32_t* I3C_ControlTypeDef::pBuffer***
  Pointer to the buffer containing the control or status register values
- ***uint32_t I3C_ControlTypeDef::Size***
  The size of pBuffer in words

36.1.8 I3C_DataTypeDef

I3C_DataTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint8_t * pBuffer***
- ***uint32_t Size***

Field Documentation

- ***uint8_t* I3C_DataTypeDef::pBuffer***
  Pointer to the buffer containing all data values to transfer
- ***uint32_t I3C_DataTypeDef::Size***
  The size of pBuffer in bytes

36.1.9 I3C_CCCTypeDef

I3C_CCCTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint8_t TargetAddr***
- ***uint8_t CCC***
- ***I3C_DataTypeDef CCCBuf***
- ***uint32_t Direction***

Field Documentation

- ***uint8_t I3C_CCCTypeDef::TargetAddr***
  Dynamic or Static target Address
- ***uint8_t I3C_CCCTypeDef::CCC***
  CCC value code
- ***I3C_DataTypeDef I3C_CCCTypeDef::CCCBuf***
  Contain size of associated data and size of defining byte if any. Contain pointer to CCC associated data
- ***uint32_t I3C_CCCTypeDef::Direction***
  CCC read and/or write direction message

36.1.10 I3C_BCRTypeDef

I3C_BCRTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***FunctionalState MaxDataSpeedLimitation***
- ***FunctionalState IBIRequestCapable***
- ***FunctionalState IBIPayload***
- ***FunctionalState OfflineCapable***
- ***FunctionalState VirtualTargetSupport***
- ***FunctionalState AdvancedCapabilities***
- ***FunctionalState DeviceRole***

Field Documentation

- ***FunctionalState I3C_BCRTypeDef::MaxDataSpeedLimitation***
  Max data speed limitation
- ***FunctionalState I3C_BCRTypeDef::IBIRequestCapable***
  IBI request capable
- ***FunctionalState I3C_BCRTypeDef::IBIPayload***
  IBI payload data
- ***FunctionalState I3C_BCRTypeDef::OfflineCapable***
  Offline capable
- ***FunctionalState I3C_BCRTypeDef::VirtualTargetSupport***
  Virtual target support
- ***FunctionalState I3C_BCRTypeDef::AdvancedCapabilities***
  Advanced capabilities
- ***FunctionalState I3C_BCRTypeDef::DeviceRole***
  Device role

36.1.11 I3C_PIDTypeDef

I3C_PIDTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint16_t MIPIMID***
- ***uint8_t IDTSEL***
- ***uint16_t PartID***
- ***uint8_t MIPIID***

Field Documentation

- ***uint16_t I3C_PIDTypeDef::MIPIMID***
  MIPI Manufacturer ID
- ***uint8_t I3C_PIDTypeDef::IDTSEL***
  Provisioned ID Type Selector
- ***uint16_t I3C_PIDTypeDef::PartID***
  Part ID device vendor to define
- ***uint8_t I3C_PIDTypeDef::MIPIID***
  Instance ID

36.1.12 I3C_ENTDAAPayloadTypeDef

I3C_ENTDAAPayloadTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***I3C_BCRTypeDef BCR***
- ***uint32_t DCR***
- ***I3C_PIDTypeDef PID***

Field Documentation

- ***I3C_BCRTypeDef I3C_ENTDAAPayloadTypeDef::BCR***
  Bus Characteristics Register
- ***uint32_t I3C_ENTDAAPayloadTypeDef::DCR***
  Device Characteristics Register

- ***I3C_PIDTypeDef I3C_ENTDAAPayloadTypeDef::PID***
  Provisioned ID

36.1.13 I3C_PrivateTypeDef

I3C_PrivateTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***uint8_t TargetAddr***
- ***I3C_DataTypeDef TxBuf***
- ***I3C_DataTypeDef RxBuf***
- ***uint32_t Direction***

Field Documentation

- ***uint8_t I3C_PrivateTypeDef::TargetAddr***
  Dynamic or Static target Address
- ***I3C_DataTypeDef I3C_PrivateTypeDef::TxBuf***
  Buffer structure containing the data to transmit (little endian)
- ***I3C_DataTypeDef I3C_PrivateTypeDef::RxBuf***
  Buffer structure containing the data to receive (little endian)
- ***uint32_t I3C_PrivateTypeDef::Direction***
  Read and/or write message

36.1.14 I3C_XferTypeDef

I3C_XferTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***I3C_ControlTypeDef CtrlBuf***
- ***I3C_ControlTypeDef StatusBuf***
- ***I3C_DataTypeDef TxBuf***
- ***I3C_DataTypeDef RxBuf***

Field Documentation

- ***I3C_ControlTypeDef I3C_XferTypeDef::CtrlBuf***
  Buffer structure containing the control register values
- ***I3C_ControlTypeDef I3C_XferTypeDef::StatusBuf***
  Buffer structure containing the status register values
- ***I3C_DataTypeDef I3C_XferTypeDef::TxBuf***
  Buffer structure containing the data to transmit
- ***I3C_DataTypeDef I3C_XferTypeDef::RxBuf***
  Buffer structure containing the data to receive

36.1.15 __I3C_HandleTypeDef

__I3C_HandleTypeDef is defined in the stm32n6xx_hal_i3c.h

Data Fields

- ***I3C_TypeDef * Instance***
- ***I3C_InitTypeDef Init***
- ***HAL_I3C_ModeTypeDef Mode***
- ***I3C_XferTypeDef * pXferData***
- ***const I3C_CCCTypeDef * pCCCDesc***
- ***const I3C_PrivateTypeDef * pPrivateDesc***
- ***uint32_t ControlXferCount***
- ***uint32_t RxXferCount***
- ***uint32_t TxXferCount***
- ***DMA_HandleTypeDef * hdmacr***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***

- *DMA_HandleTypeDef * hdmasr*
- *HAL_LockTypeDef Lock*
- *__IO HAL_I3C_StateTypeDef State*
- *__IO HAL_I3C_StateTypeDef PreviousState*
- *__IO uint32_t ErrorCode*
- *HAL_StatusTypeDef(* XferISR*
- *void(* ptrTxFunc*
- *void(* ptrRxFunc*
- *void(* CtrlTxCpltCallback*
- *void(* CtrlRxCpltCallback*
- *void(* CtrlMultipleXferCpltCallback*
- *void(* CtrlDAACpltCallback*
- *void(* TgtReqDynamicAddrCallback*
- *void(* TgtTxCpltCallback*
- *void(* TgtRxCpltCallback*
- *void(* TgtHotJoinCallback*
- *void(* NotifyCallback*
- *void(* ErrorCallback*
- *void(* AbortCpltCallback*
- *void(* MspInitCallback*
- *void(* MspDeInitCallback*

Field Documentation

- ***I3C_TypeDef* __I3C_HandleTypeDef::Instance***
  I3C registers base address
- ***I3C_InitTypeDef __I3C_HandleTypeDef::Init***
  I3C communication parameters
- ***HAL_I3C_ModeTypeDef __I3C_HandleTypeDef::Mode***
  I3C communication mode. This parameter must be a value of
  Section 36.3.1: I3C_mode_structure_definition
- ***I3C_XferTypeDef* __I3C_HandleTypeDef::pXferData***
  I3C transfer buffers pointer
- ***const I3C_CCCTypeDef* __I3C_HandleTypeDef::pCCCDesc***
  I3C CCC descriptor pointer
- ***const I3C_PrivateTypeDef* __I3C_HandleTypeDef::pPrivateDesc***
  I3C private transfer descriptor pointer
- ***uint32_t __I3C_HandleTypeDef::ControlXferCount***
  I3C counter indicating the remaining control data bytes to write in the control register
- ***uint32_t __I3C_HandleTypeDef::RxXferCount***
  I3C counter indicating the remaining data bytes to receive
- ***uint32_t __I3C_HandleTypeDef::TxXferCount***
  I3C counter indicating the remaining data bytes to transmit
- ***DMA_HandleTypeDef* __I3C_HandleTypeDef::hdmacr***
  I3C control DMA handle parameters
- ***DMA_HandleTypeDef* __I3C_HandleTypeDef::hdmatx***
  I3C Tx DMA handle parameters

- ***void(* __I3C_HandleTypeDef::TgtReqDynamicAddrCallback)(struct __I3C_HandleTypeDef *hi3c, uint64_t targetPayload)***
  I3C Controller request dynamic address callback during Dynamic Address Assignment processus
- ***void(* __I3C_HandleTypeDef::TgtTxCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Target private data Tx Transfer completed callback
- ***void(* __I3C_HandleTypeDef::TgtRxCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Target private data Rx Transfer completed callback
- ***void(* __I3C_HandleTypeDef::TgtHotJoinCallback)(struct __I3C_HandleTypeDef *hi3c, uint8_t dynamicAddress)***
  I3C Target Hot-Join callback
- ***void(* __I3C_HandleTypeDef::NotifyCallback)(struct __I3C_HandleTypeDef *hi3c, uint32_t eventId)***
  I3C Target or Controller asynchronous events callback
- ***void(* __I3C_HandleTypeDef::ErrorCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Error callback
- ***void(* __I3C_HandleTypeDef::AbortCpltCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Abort complete callback
- ***void(* __I3C_HandleTypeDef::MspInitCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Msp Init callback
- ***void(* __I3C_HandleTypeDef::MspDeInitCallback)(struct __I3C_HandleTypeDef *hi3c)***
  I3C Msp DeInit callback

36.2 I3C Firmware driver API description

The following section lists the various functions of the I3C library.

36.2.1 How to use this driver

The I3C HAL driver can be used as follows:

1. Declare a I3C_HandleTypeDef handle structure, for example: I3C_HandleTypeDef hi3c;
2. Declare a I3C_XferTypeDef transfer descriptor structure, for example: I3C_XferTypeDef ContextBuffers;

3. Initialize the I3C low level resources by implementing the HAL_I3C_MspInit() API:
   a. Enable the I3Cx interface clock
   b. I3C pins configuration
      - Enable the clock for the I3C GPIOs
      - Configure I3C pins as alternate function push-pull with no-pull
   c. NVIC configuration if you need to use interrupt process
      - Configure the I3Cx interrupt priority
      - Enable the NVIC I3C IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare a DMA_HandleTypeDef handle structure for the Command Common Code (CCC) management channel
      - Declare a DMA_HandleTypeDef handle structure for the transmit channel
      - Declare a DMA_HandleTypeDef handle structure for the receive channel
      - Declare a DMA_HandleTypeDef handle structure for the status channel
      - Enable the DMAx interface clock
      - Configure the DMA handle parameters
      - Configure the DMA Command Common Code (CCC) channel
      - Configure the DMA Tx channel
      - Configure the DMA Rx channel
      - Configure the DMA Status channel
      - Associate the initialized DMA handle to the hi3c DMA CCC, Tx, Rx or Status handle as necessary
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA CCC, Tx, Rx or Status instance
4. Configure the HAL I3C Communication Mode as Controller or Target in the hi3c Init structure.
5. Configure the Controller Communication Bus characterics for Controller mode. This mean, configure the parameters SDAHoldTime, WaitTime, SCLPPLowDuration, SCLI3CHighDuration, SCLODLowDuration, SCLI2CHighDuration, BusFreeDuration, BusIdleDuration in the LL_I3C_CtrlBusConfTypeDef structure through h3c Init structure.
6. Configure the Target Communication Bus characterics for Target mode. This mean, configure the parameter BusAvailableDuration in the LL_I3C_TgtBusConfTypeDef structure through h3c Init structure. All these parameters for Controller or Target can be configured directly in user code or by using CubeMx generation. To help the computation of the different parameters, the recommendation is to use CubeMx. Those parameters can be modified after the hi3c initialization by using HAL_I3C_Ctrl_BusCharacteristicConfig() for controller and HAL_I3C_Tgt_BusCharacteristicConfig() for target.
7. Initialize the I3C registers by calling the HAL_I3C_Init(), configures also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL_I3C_MspInit(&hi3c) API.
8. Configure the different FIFO parameters in I3C_FifoConfTypeDef structure as RxFifoThreshold, TxFifoThreshold for Controller or Target mode. And enable/disable the Control or Status FIFO only for Controller Mode. Use HAL_I3C_SetConfigFifo() function to finalize the configuration, and HAL_I3C_GetConfigFifo() to retrieve FIFO configuration. Possibility to clear the FIFO configuration by using HAL_I3C_ClearConfigFifo() which reset the configuration FIFO to their default hardware value
9. Configure the different additional Controller configuration in I3C_CtrlConfTypeDef structure as DynamicAddr, StallTime, HotJoinAllowed, ACKStallState, CCCStallState, TxStallState, RxStallState, HighKeeperSDA. Use HAL_I3C_Ctrl_Config() function to finalize the Controller configuration.
10. Configure the different additional Target configuration in I3C_TgtConfTypeDef structure as Identifier, MIPIIdentifier, CtrlRoleRequest, HotJoinRequest, IBIRequest, IBIPayload, IBIPayloadSize, MaxReadDataSize, MaxWriteDataSize, CtrlCapability, GroupAddrCapability, DataTurnAroundDuration, MaxReadTurnAround, MaxDataSpeed, MaxSpeedLimitation, HandOffActivityState, HandOffDelay, PendingReadMDB. Use HAL_I3C_Tgt_Config() function to finalize the Target configuration.

11. Before initiate any IO operation, the application must launch an assignment of the different Target dynamic address by using HAL_I3C_Ctrl_DynAddrAssign() in polling mode or HAL_I3C_Ctrl_DynAddrAssign_IT() in interrupt mode. This procedure is named Enter Dynamic Address Assignment (ENTDAA CCC command). For the initiation of ENTDAA procedure from the controller, each target connected and powered on the I3C bus must repond to this particular Command Common Code by sending its proper Payload (a amount of 48bits which contain the target characteristics) Each time a target responds to ENTDAA sequence, the application is informed through HAL_I3C_TgtReqDynamicAddrCallback() of the reception of the target paylaod. And then application must send a associated dynamic address through HAL_I3C_Ctrl_SetDynAddr(). This procedure in loop automatically in hardware side until a target respond to repeated ENTDAA sequence. The application is informed of the end of the procedure at reception of HAL_I3C_CtrlDAACpltCallback(). Then application can easily retrieve ENTDAA payload information through HAL_I3C_Get_ENTDAA_Payload_Info() function. At the end of procedure, the function HAL_I3C_Ctrl_ConfigBusDevices() must be called to store in hardware register part the target capabilities as Dynamic address, IBI support with or without additional data byte, Controller role request support, Controller stop transfer after IBI through I3C_DeviceConfTypeDef structure.
12. Other action to be done, before initiate any IO operation, the application must prepare the different frame descriptor with its associated buffer allocation in their side. Configure the different information related to CCC transfer through I3C_CCCTypeDef structure Configure the different information related to Private or I2C transfer through I3C_PrivateTypeDef structure Configure the different buffer pointers and associated size needed for the driver communication through I3C_XferTypeDef structure The I3C_XferTypeDef structure contains different parameters about Control, Status buffer, and Transmit and Receive buffer. Use HAL_I3C_AddDescToFrame() function each time application add a descriptor in the frame before call a Controller IO operation interface One element of the frame descriptor correspond to one frame to manage through IO operation.
13. To check if I3C target device is ready for communication, use the function HAL_I3C_Ctrl_IsDeviceI3C_Ready()
14. To check if I2C target device is ready for communication, use the function HAL_I3C_Ctrl_IsDeviceI2C_Ready()
15. To send a message header {S + 0x7E + W + STOP}, use the function HAL_I3C_Ctrl_GenerateArbitration().
16. To insert a target reset pattern before the STOP of a transmitted frame containing a RSTACT CCC command, the application must enable the reset pattern configuration using HAL_I3C_Ctrl_SetConfigResetPattern() before calling HAL_I3C_Ctrl_TransmitCCC() or HAL_I3C_Ctrl_ReceiveCCC() interfaces. To have a standard STOP emitted at the end of a frame containing a RSTACT CCC command, the application must disable the reset pattern configuration using HAL_I3C_Ctrl_SetConfigResetPattern() before calling HAL_I3C_Ctrl_TransmitCCC() or HAL_I3C_Ctrl_ReceiveCCC() interfaces. Use HAL_I3C_Ctrl_SetConfigResetPattern() function to configure the insertion of the reset pattern at the end of a Frame, and HAL_I3C_Ctrl_GetConfigResetPattern() to retrieve reset pattern configuration.
17. For I3C IO operations, three operation modes are available within this driver :

Polling mode IO operation

- Activate asynchronous event in controller or target mode a Common Command Code in a broadcast or a direct communication in blocking mode using HAL_I3C_Ctrl_TransmitCCC()
- Transmit in controller mode a Common Command Code in a broadcast or a direct communication in blocking mode using HAL_I3C_Ctrl_TransmitCCC()
- Receive in controller mode a Common Command Code in a direct communication in blocking mode using HAL_I3C_Ctrl_ReceiveCCC()
- Transmit in controller mode an amount of private data in an I3C or an I2C communication in blocking mode using HAL_I3C_Ctrl_Transmit()
- Receive in controller mode an amount of private data in an I3C or an I2C communication in blocking mode using HAL_I3C_Ctrl_Receive()
- Transmit in target mode an amount of private data in an I3C communication in blocking mode using HAL_I3C_Tgt_Transmit()
- Receive in target mode an amount of private data in an I3C communication in blocking mode using HAL_I3C_Tgt_Receive()
- At the end of a transfer, the different FIFO can be flushed if necessary by using HAL_I3C_FlushAllFifo() for flush all the FIFO, or flush individually y using HAL_I3C_FlushTxFifo(), HAL_I3C_FlushRxFifo(), HAL_I3C_FlushControlFifo(), HAL_I3C_FlushStatusFifo().
- Request a HotJoin in target mode in blocking mode using HAL_I3C_Tgt_HotJoinReq()
- Request a In Band Interrupt in target mode in blocking mode using HAL_I3C_Tgt_IBIReq()

- Request a Controller Role in target mode in blocking mode using HAL_I3C_Tgt_ControlRoleReq()

DMA and Interrupt mode IO operation

- Transmit in controller mode a Common Command Code in a broadcast or a direct communication in non-blocking mode using HAL_I3C_Ctrl_TransmitCCC_IT() or HAL_I3C_Ctrl_TransmitCCC_DMA()
- At transmission end of transfer, HAL_I3C_CtrlTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlTxCpltCallback()
- Receive in controller mode a Common Command Code in a direct communication in non-blocking mode using HAL_I3C_Ctrl_ReceiveCCC_IT() or HAL_I3C_Ctrl_ReceiveCCC_DMA()
- At reception end of transfer, HAL_I3C_CtrlRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlRxCpltCallback()
- Transmit in controller mode an amount of private data in an I3C or an I2C communication in non-blocking mode using HAL_I3C_Ctrl_Transmit_IT() or HAL_I3C_Ctrl_Transmit_DMA()
- At transmission end of transfer, HAL_I3C_CtrlTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlTxCpltCallback()
- Receive in controller mode an amount of private data in an I3C or an I2C communication in non-blocking mode using HAL_I3C_Ctrl_Receive_IT() or HAL_I3C_Ctrl_Receive_DMA()
- At reception end of transfer, HAL_I3C_CtrlRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlRxCpltCallback()
- Transfer in multiple direction (transmit/receive) in controller mode a Common Command Code in a direct communication or an amount of private data in an I2C or I3C communication in non-blocking mode using HAL_I3C_Ctrl_MultipleTransfer_IT() or HAL_I3C_Ctrl_MultipleTransfer_DMA()
- At the end of transfer, HAL_I3C_CtrlMultipleXferCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_CtrlMultipleXferCpltCallback()
- Transmit in target mode an amount of private data in an I3C communication in non-blocking mode using HAL_I3C_Tgt_Transmit_IT() or HAL_I3C_Tgt_Transmit_DMA()
- At transmission end of transfer, HAL_I3C_TgtTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_TgtTxCpltCallback()
- Receive in target mode an amount of private data in an I3C communication in non-blocking mode using HAL_I3C_Tgt_Receive_IT() or HAL_I3C_Tgt_Receive_DMA()
- At reception end of transfer, HAL_I3C_TgtRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_TgtRxCpltCallback()
- To treat asynchronous event, HAL_I3C_ActivateNotification() or HAL_I3C_DeactivateNotification() function is used for enable or disable one or more notification related to specific asynchronous event. Each time one or more event detected by hardware the associated HAL_I3C_NotifyCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_NotifyCallback(). Then application can easily retrieve some specific associated event data through HAL_I3C_GetCCCInfo() function
- At the end of a transfer, the different FIFO can be flushed if necessary by using HAL_I3C_FlushAllFifo() for flush all the FIFO, or flush individually y using HAL_I3C_FlushTxFifo(), HAL_I3C_FlushRxFifo(), HAL_I3C_FlushControlFifo(), HAL_I3C_FlushStatusFifo().
- Request a HotJoin in target mode in non-blocking mode using HAL_I3C_Tgt_HotJoinReq_IT
- At completion, HAL_I3C_TgtHotJoinCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_TgtHotJoinCallback()
- Request an In Band Interrupt in target mode in non-blocking mode using HAL_I3C_Tgt_IBIReq_IT()
- At completion, HAL_I3C_NotifyCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_NotifyCallback()
- Request a Controller Role in target mode in non-blocking mode using HAL_I3C_Tgt_ControlRoleReq_IT()
- At completion, HAL_I3C_NotifyCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_NotifyCallback()
- To manage the wakeup capability, HAL_I3C_ActivateNotification() or HAL_I3C_DeactivateNotification() function is used for enable or disable Wake Up interrupt. At wakeup detection the associated HAL_I3C_NotifyCallback() is executed.
- In case of transfer Error, HAL_I3C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I3C_ErrorCallback()
- Abort an I3C process communication with Interrupt using HAL_I3C_Abort_IT()

- End of abort process, HAL_I3C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I3C_AbortCpltCallback()

I3C HAL driver macros list

Below the list of most used macros in I3C HAL driver.

- __HAL_I3C_ENABLE: Enable the I3C peripheral
- __HAL_I3C_DISABLE: Disable the I3C peripheral
- __HAL_I3C_RESET_HANDLE_STATE: Reset the I3C handle state
- __HAL_I3C_GET_FLAG: Check whether the specified I3C flag is set or not

Callback registration

The compilation flag USE_HAL_I3C_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_I3C_RegisterCallback() or HAL_I3C_RegisterNotifyCallback() or HAL_I3C_RegisterTgtReqDynamicAddrCallback() or HAL_I3C_RegisterTgtHotJoinCallback() to register an interrupt callback.

Function HAL_I3C_RegisterCallback() allows to register following callbacks:

- CtrlTxCpltCallback : callback for Controller transmission CCC, I3C private or I2C end of transfer.
- CtrlRxCpltCallback : callback for Controller reception CCC, I3C private or I2C end of transfer.
- CtrlMultipleXferCpltCallback : callback for Controller multiple Direct CCC, I3C private or I2C end of transfer.
- CtrlDAACpltCallback : callback for Controller Enter Dynamic Address Assignment end of transfer.
- TgtTxCpltCallback : callback for Target transmission I3C private end of transfer.
- TgtRxCpltCallback : callback for Target reception I3C private end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific callback NotifyCallback use dedicated register callbacks : HAL_I3C_RegisterNotifyCallback().

For specific callback TgtReqDynamicAddrCallback use dedicated register callbacks : HAL_I3C_RegisterTgtReqDynamicAddrCallback().

For specific callback TgtHotJoinCallback use dedicated register callbacks : HAL_I3C_RegisterTgtHotJoinCallback().

Use function HAL_I3C_UnRegisterCallback to reset a callback to the default weak function. HAL_I3C_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- CtrlTxCpltCallback : callback for Controller transmission CCC, I3C private or I2C end of transfer.
- CtrlRxCpltCallback : callback for Controller reception CCC, I3C private or I2C end of transfer.
- CtrlMultipleXferCpltCallback : callback for Controller multiple Direct CCC, I3C private or I2C end of transfer.
- CtrlDAACpltCallback : callback for Controller Enter Dynamic Address Assignment end of transfer.
- TgtTxCpltCallback : callback for Target transmission I3C private end of transfer.
- TgtRxCpltCallback : callback for Target reception I3C private end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.
- NotifyCallback : callback for Controller and Target notification process.
- TgtReqDynamicAddrCallback : callback for controller application when a target sent its payload to the controller during Dynamic Address Assignment process.
- TgtHotJoinCallback : callback for Target Hotjoin completion process.

By default, after the HAL_I3C_Init() and when the state is HAL_I3C_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I3C_CtrlTxCpltCallback(), HAL_I3C_CtrlRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I3C_Init()/ HAL_I3C_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I3C_Init()/ HAL_I3C_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_I3C_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_I3C_STATE_READY or HAL_I3C_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I3C_RegisterCallback() before calling HAL_I3C_DeInit() or HAL_I3C_Init() function.

When the compilation flag USE_HAL_I3C_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Note: You can refer to the I3C HAL driver header file for more useful macros

36.2.2 Detailed description of functions

HAL_I3C_Init

Function name

HAL_StatusTypeDef HAL_I3C_Init (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_DeInit

Function name

HAL_StatusTypeDef HAL_I3C_DeInit (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_MspInit

Function name

void HAL_I3C_MspInit (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_MspDeInit

Function name

void HAL_I3C_MspDeInit (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterCallback (I3C_HandleTypeDef * hi3c, HAL_I3C_CallbackIDTypeDef callbackID, pI3C_CallbackTypeDef pCallback)

Function description

HAL_I3C_RegisterNotifyCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterNotifyCallback (I3C_HandleTypeDef * hi3c, pI3C_NotifyCallbackTypeDef pNotifyCallback)

Function description

HAL_I3C_RegisterTgtReqDynamicAddrCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterTgtReqDynamicAddrCallback (I3C_HandleTypeDef * hi3c, pI3C_TgtReqDynamicAddrCallbackTypeDef pTgtReqAddrCallback)

Function description

HAL_I3C_RegisterTgtHotJoinCallback

Function name

HAL_StatusTypeDef HAL_I3C_RegisterTgtHotJoinCallback (I3C_HandleTypeDef * hi3c, pI3C_TgtHotJoinCallbackTypeDef pTgtHotJoinCallback)

Function description

HAL_I3C_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I3C_UnRegisterCallback (I3C_HandleTypeDef * hi3c, HAL_I3C_CallbackIDTypeDef callbackID)

Function description

HAL_I3C_ActivateNotification

Function name

HAL_StatusTypeDef HAL_I3C_ActivateNotification (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t interruptMask)

Function description

HAL_I3C_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_I3C_DeactivateNotification (I3C_HandleTypeDef * hi3c, uint32_t interruptMask)

Function description

HAL_I3C_CtrlTxCpltCallback

Function name

void HAL_I3C_CtrlTxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_CtrlRxCpltCallback

Function name

void HAL_I3C_CtrlRxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_CtrlMultipleXferCpltCallback

Function name

void HAL_I3C_CtrlMultipleXferCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_CtrlDAACpltCallback

Function name

void HAL_I3C_CtrlDAACpltCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_TgtReqDynamicAddrCallback

Function name

void HAL_I3C_TgtReqDynamicAddrCallback (I3C_HandleTypeDef * hi3c, uint64_t targetPayload)

Function description

HAL_I3C_TgtTxCpltCallback

Function name

void HAL_I3C_TgtTxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_TgtRxCpltCallback

Function name

void HAL_I3C_TgtRxCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_TgtHotJoinCallback

Function name

void HAL_I3C_TgtHotJoinCallback (I3C_HandleTypeDef * hi3c, uint8_t dynamicAddress)

Function description

HAL_I3C_NotifyCallback

Function name

void HAL_I3C_NotifyCallback (I3C_HandleTypeDef * hi3c, uint32_t eventId)

Function description

HAL_I3C_AbortCpltCallback

Function name

void HAL_I3C_AbortCpltCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_ErrorCallback

Function name

void HAL_I3C_ErrorCallback (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_ER_IRQHandler

Function name

void HAL_I3C_ER_IRQHandler (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_EV_IRQHandler

Function name

void HAL_I3C_EV_IRQHandler (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_Ctrl_BusCharacteristicConfig

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_BusCharacteristicConfig (I3C_HandleTypeDef * hi3c, const LL_I3C_CtrlBusConfTypeDef * pConfig)

Function description

HAL_I3C_Tgt_BusCharacteristicConfig

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_BusCharacteristicConfig (I3C_HandleTypeDef * hi3c, const LL_I3C_TgtBusConfTypeDef * pConfig)

Function description

HAL_I3C_SetConfigFifo

Function name

HAL_StatusTypeDef HAL_I3C_SetConfigFifo (I3C_HandleTypeDef * hi3c, const I3C_FifoConfTypeDef * pConfig)

Function description

HAL_I3C_Ctrl_Config

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Config (I3C_HandleTypeDef * hi3c, const I3C_CtrlConfTypeDef * pConfig)

Function description

HAL_I3C_Tgt_Config

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Config (I3C_HandleTypeDef * hi3c, const I3C_TgtConfTypeDef * pConfig)

Function description

HAL_I3C_Ctrl_ConfigBusDevices

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ConfigBusDevices (I3C_HandleTypeDef * hi3c, const I3C_DeviceConfTypeDef * pDesc, uint8_t nbDevice)

Function description

HAL_I3C_AddDescToFrame

Function name

HAL_StatusTypeDef HAL_I3C_AddDescToFrame (I3C_HandleTypeDef * hi3c, const I3C_CCCTypeDef * pCCCDesc, const I3C_PrivateTypeDef * pPrivateDesc, I3C_XferTypeDef * pXferData, uint8_t nbFrame, uint32_t option)

Function description

HAL_I3C_Ctrl_SetConfigResetPattern

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_SetConfigResetPattern (I3C_HandleTypeDef * hi3c, uint32_t resetPattern)

Function description

HAL_I3C_Ctrl_GetConfigResetPattern

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_GetConfigResetPattern (I3C_HandleTypeDef * hi3c, uint32_t * pResetPattern)

Function description

HAL_I3C_FlushAllFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushAllFifo (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_FlushTxFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushTxFifo (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_FlushRxFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushRxFifo (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_FlushControlFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushControlFifo (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_FlushStatusFifo

Function name

HAL_StatusTypeDef HAL_I3C_FlushStatusFifo (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_ClearConfigFifo

Function name

HAL_StatusTypeDef HAL_I3C_ClearConfigFifo (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_GetConfigFifo

Function name

HAL_StatusTypeDef HAL_I3C_GetConfigFifo (I3C_HandleTypeDef * hi3c, I3C_FifoConfTypeDef * pConfig)

Function description

HAL_I3C_Ctrl_TransmitCCC

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_TransmitCCC (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

HAL_I3C_Ctrl_TransmitCCC_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_TransmitCCC_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_TransmitCCC_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_TransmitCCC_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_ReceiveCCC

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ReceiveCCC (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

HAL_I3C_Ctrl_ReceiveCCC_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ReceiveCCC_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_ReceiveCCC_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_ReceiveCCC_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_Transmit

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Transmit (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

HAL_I3C_Ctrl_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Transmit_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Transmit_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_Receive

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Receive (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

HAL_I3C_Ctrl_Receive_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Receive_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_Receive_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_MultipleTransfer_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_MultipleTransfer_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_MultipleTransfer_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_MultipleTransfer_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Ctrl_SetDynAddr

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_SetDynAddr (I3C_HandleTypeDef * hi3c, uint8_t devAddress)

Function description

HAL_I3C_Ctrl_DynAddrAssign_IT

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_DynAddrAssign_IT (I3C_HandleTypeDef * hi3c, uint32_t dynOption)

Function description

HAL_I3C_Ctrl_DynAddrAssign

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_DynAddrAssign (I3C_HandleTypeDef * hi3c, uint64_t * target_payload, uint32_t dynOption, uint32_t timeout)

Function description

HAL_I3C_Ctrl_IsDeviceI3C_Ready

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_IsDeviceI3C_Ready (I3C_HandleTypeDef * hi3c, uint8_t devAddress, uint32_t trials, uint32_t timeout)

Function description

HAL_I3C_Ctrl_IsDeviceI2C_Ready

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_IsDeviceI2C_Ready (I3C_HandleTypeDef * hi3c, uint8_t devAddress, uint32_t trials, uint32_t timeout)

Function description

HAL_I3C_Ctrl_GenerateArbitration

Function name

HAL_StatusTypeDef HAL_I3C_Ctrl_GenerateArbitration (I3C_HandleTypeDef * hi3c, uint32_t timeout)

Function description

HAL_I3C_Tgt_Transmit

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Transmit (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

HAL_I3C_Tgt_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Transmit_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Tgt_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Transmit_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Tgt_Receive

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Receive (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData, uint32_t timeout)

Function description

HAL_I3C_Tgt_Receive_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Receive_IT (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Tgt_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_Receive_DMA (I3C_HandleTypeDef * hi3c, I3C_XferTypeDef * pXferData)

Function description

HAL_I3C_Tgt_ControlRoleReq

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_ControlRoleReq (I3C_HandleTypeDef * hi3c, uint32_t timeout)

Function description

HAL_I3C_Tgt_ControlRoleReq_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_ControlRoleReq_IT (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_Tgt_HotJoinReq

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_HotJoinReq (I3C_HandleTypeDef * hi3c, uint8_t * pAddress, uint32_t timeout)

Function description

HAL_I3C_Tgt_HotJoinReq_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_HotJoinReq_IT (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_Tgt_IBIReq

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_IBIReq (I3C_HandleTypeDef * hi3c, const uint8_t * pPayload, uint8_t payloadSize, uint32_t timeout)

Function description

HAL_I3C_Tgt_IBIReq_IT

Function name

HAL_StatusTypeDef HAL_I3C_Tgt_IBIReq_IT (I3C_HandleTypeDef * hi3c, const uint8_t * pPayload, uint8_t payloadSize)

Function description

HAL_I3C_Abort_IT

Function name

HAL_StatusTypeDef HAL_I3C_Abort_IT (I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_GetState

Function name

HAL_I3C_StateTypeDef HAL_I3C_GetState (const I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_GetMode

Function name

HAL_I3C_ModeTypeDef HAL_I3C_GetMode (const I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_GetError

Function name

uint32_t HAL_I3C_GetError (const I3C_HandleTypeDef * hi3c)

Function description

HAL_I3C_GetCCCInfo

Function name

HAL_StatusTypeDef HAL_I3C_GetCCCInfo (I3C_HandleTypeDef * hi3c, uint32_t notifyId, I3C_CCCInfoTypeDef * pCCCInfo)

Function description

HAL_I3C_Get_ENTDAA_Payload_Info

Function name

HAL_StatusTypeDef HAL_I3C_Get_ENTDAA_Payload_Info (I3C_HandleTypeDef * hi3c, uint64_t ENTDAA_payload, I3C_ENTDAAPayloadTypeDef * pENTDAA_payload)

Function description

36.3 I3C Firmware driver defines

The following section lists the various define and macros of the module.

36.3.1 I3C

I3C

I3C BCR IN PAYLOAD

HAL_I3C_BCR_IN_PAYLOAD_SHIFT

BCR field in target payload

LL_I3C_BCR_IN_PAYLOAD_SHIFT

BCR field in target payload

I3C COMMON INTERRUPT

HAL_I3C_IT_TXFNFIE

Tx FIFO not full interrupt enable

HAL_I3C_IT_RXFNEIE

Rx FIFO not empty interrupt enable

HAL_I3C_IT_FCIE

Frame complete interrupt enable

HAL_I3C_IT_ERRIE

Error interrupt enable

HAL_I3C_ALL_COMMON_ITS

I3C CONTROLLER INTERRUPT

HAL_I3C_IT_CFNFIE

Control FIFO not full interrupt enable

HAL_I3C_IT_SFNEIE

Status FIFO not empty interrupt enable

HAL_I3C_IT_HJIE

Hot-join interrupt enable

HAL_I3C_IT_CRIE

Controller-role request interrupt enable

HAL_I3C_IT_IBIIE

IBI request interrupt enable

HAL_I3C_IT_RXTGTENDIE

Target-initiated read end interrupt enable

HAL_I3C_ALL_CTRL_ITS

CONTROL FIFO STATE

HAL_I3C_CONTROLFIFO_DISABLE

Control FIFO mode disable

HAL_I3C_CONTROLFIFO_ENABLE

Control FIFO mode enable

DIRECTION

HAL_I3C_DIRECTION_WRITE

Write transfer

HAL_I3C_DIRECTION_READ

Read transfer

HAL_I3C_DIRECTION_BOTH

Read and Write transfer

I3C DYNAMIC ADDRESS OPTION DEFINITION

I3C_RSTDAA_THEN_ENTDAA

Initiate a RSTDAA before a ENTDAA procedure

I3C_ONLY_ENTDAA

Initiate a ENTDAA without RSTDAA

ERROR CODE DEFINITION

HAL_I3C_ERROR_NONE

No error

HAL_I3C_ERROR_CE0

Controller detected an illegally formatted CCC

HAL_I3C_ERROR_CE1

Controller detected that transmitted data on the bus is different than expected

HAL_I3C_ERROR_CE2

Controller detected that broadcast address 7'h7E has been nacked

HAL_I3C_ERROR_CE3

Controller detected that new Controller did not drive the bus after Controller-role handoff

HAL_I3C_ERROR_TE0

Target detected an invalid broadcast address

HAL_I3C_ERROR_TE1

Target detected an invalid CCC Code

HAL_I3C_ERROR_TE2

Target detected a parity error during a write data

HAL_I3C_ERROR_TE3

Target detected a parity error on assigned address during dynamic address arbitration

HAL_I3C_ERROR_TE4

Target detected 7'h7E missing after Restart during Dynamic Address Assignment procedure

HAL_I3C_ERROR_TE5

Target detected an illegally formatted CCC

HAL_I3C_ERROR_TE6

Target detected that transmitted data on the bus is different than expected

HAL_I3C_ERROR_DATA_HAND_OFF

I3C data error during controller-role hand-off process

HAL_I3C_ERROR_DATA_NACK

I3C data not acknowledged error

HAL_I3C_ERROR_ADDRESS_NACK

I3C address not acknowledged error

HAL_I3C_ERROR_COVR

I3C S FIFO Over-Run or C FIFO Under-Run error

HAL_I3C_ERROR_DOVR

I3C Rx FIFO Over-Run or Tx FIFO Under-Run error

HAL_I3C_ERROR_STALL

I3C SCL stall error

HAL_I3C_ERROR_DMA

DMA transfer error

HAL_I3C_ERROR_TIMEOUT

Timeout error

HAL_I3C_ERROR_DMA_PARAM

DMA Parameter Error

HAL_I3C_ERROR_INVALID_PARAM

Invalid Parameters error

HAL_I3C_ERROR_SIZE

I3C size management error

HAL_I3C_ERROR_NOT_ALLOWED

I3C operation is not allowed

HAL_I3C_ERROR_DYNAMIC_ADDR

I3C dynamic address error

HAL_I3C_ERROR_INVALID_CALLBACK

Invalid Callback error

I3C Exported Macros

__HAL_I3C_RESET_HANDLE_STATE

Description:

- Reset I3C handle state.

Parameters:

- __HANDLE__: specifies the I3C Handle.

Return value:

- None

__HAL_I3C_ENABLE_IT

Description:

- Enable the specified I3C interrupt.

Parameters:

- __HANDLE__: specifies the I3C Handle.
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one value or a combination of the following group's values:
  - I3C CONTROLLER INTERRUPT
  - I3C TARGET INTERRUPT
  - I3C COMMON INTERRUPT

Return value:

- None

__HAL_I3C_DISABLE_IT

Description:

- Disable the specified I3C interrupt.

Parameters:

- __HANDLE__: specifies the I3C Handle.
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one value or a combination of the following group's values:
  - I3C CONTROLLER INTERRUPT
  - I3C TARGET INTERRUPT
  - I3C COMMON INTERRUPT

Return value:

- None

__HAL_I3C_GET_FLAG

Description:

- Check whether the specified I3C flag is set or not.

Parameters:

- __HANDLE__: specifies the I3C Handle.
- __FLAG__: specifies the flag to check. This parameter can be one value of the group
  - I3C FLAGS values.

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_I3C_GET_BCR

Description:

- Get Bus Characterics in payload (64bits) receive during ENTDAA procedure.

Parameters:

- __PAYLOAD__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00(uint64_t) and Max_Data=0xFFFFFFFFFFFFFFFF.

Return value:

- The: value of BCR Return value between Min_Data=0x00 and Max_Data=0xFF.

__HAL_I3C_GET_IBI_CAPABLE

Description:

- Check IBI request capabilities.

Parameters:

- __BCR__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF.

Return value:

- The: state of IBI request capabilities (ENABLE or DISABLE).

__HAL_I3C_GET_IBI_PAYLOAD

Description:

- Check IBI additional data byte capabilities.

Parameters:

- __BCR__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF.

Return value:

- The: state of IBI additional data byte capabilities (ENABLE or DISABLE).

__HAL_I3C_GET_CR_CAPABLE

Description:

- Check Controller role request capabilities.

Parameters:

- __BCR__: specifies the Bus Characteristics capabilities retrieve during ENTDAA procedure. This parameter must be a number between Min_Data=0x00 and Max_Data=0xFF.

Return value:

- The: state of Controller role request capabilities (ENABLE or DISABLE).

I3C FLAGS

HAL_I3C_FLAG_CFEF

Control FIFO not empty flag

HAL_I3C_FLAG_TXFEF

Tx FIFO empty flag

HAL_I3C_FLAG_CFNFF

Control FIFO not full flag

HAL_I3C_FLAG_SFNEF

Status FIFO not empty flag

HAL_I3C_FLAG_TXFNFF

Tx FIFO not full flag

HAL_I3C_FLAG_RXFNEF

Rx FIFO not empty flag

HAL_I3C_FLAG_RXLASTF

Last read data byte/word flag

HAL_I3C_FLAG_TXLASTF

Last written data byte/word flag

HAL_I3C_FLAG_FCF

Frame complete flag

HAL_I3C_FLAG_RXTGTENDF

Target-initiated read end flag

HAL_I3C_FLAG_ERRF

Error flag

HAL_I3C_FLAG_IBIF

IBI request flag

HAL_I3C_FLAG_IBIENDF

IBI end flag

HAL_I3C_FLAG_CRF

Controller-role request flag

HAL_I3C_FLAG_CRUPDF

Controller-role update flag

HAL_I3C_FLAG_HJF

Hot-join flag

HAL_I3C_FLAG_WKPF

Wakeup flag

HAL_I3C_FLAG_GETF

GETxxx CCC flag

HAL_I3C_FLAG_STAF

Format 1 GETSTATUS CCC flag

HAL_I3C_FLAG_DAUPDF

ENTDAA/RSTDAA/SETNEWDA CCC flag

HAL_I3C_FLAG_MWLUPDF

SETMWL CCC flag

HAL_I3C_FLAG_MRLUPDF

SETMRL CCC flag

HAL_I3C_FLAG_RSTF

Reset pattern flag

HAL_I3C_FLAG_ASUPDF

ENTASx CCC flag

HAL_I3C_FLAG_INTUPDF

ENEC/DISEC CCC flag

HAL_I3C_FLAG_DEFF

DEFTGTS CCC flag

HAL_I3C_FLAG_GRPF

DEFGRPA CCC flag

GETMXDS FORMAT

HAL_I3C_GETMXDS_FORMAT_1

GETMXDS CCC Format 1 is used, no MaxRdTurn field in response

HAL_I3C_GETMXDS_FORMAT_2_LSB

GETMXDS CCC Format 2 is used, MaxRdTurn field in response, LSB = RDTURN[7:0]

HAL_I3C_GETMXDS_FORMAT_2_MID

GETMXDS CCC Format 2 is used, MaxRdTurn field in response, Middle byte = RDTURN[7:0]

HAL_I3C_GETMXDS_FORMAT_2_MSB

GETMXDS CCC Format 2 is used, MaxRdTurn field in response, MSB = RDTURN[7:0]

HANDOFF ACTIVITY STATE

HAL_I3C_HANDOFF_ACTIVITY_STATE_0

Activity state 0 after handoff

HAL_I3C_HANDOFF_ACTIVITY_STATE_1

Activity state 1 after handoff

HAL_I3C_HANDOFF_ACTIVITY_STATE_2

Activity state 2 after handoff

HAL_I3C_HANDOFF_ACTIVITY_STATE_3

Activity state 3 after handoff

OPTION DEFINITION

I3C_DIRECT_WITH_DEFBYTE_RESTART

Restart between each Direct Command then Stop request for last command. Each Command have an associated defining byte

I3C_DIRECT_WITH_DEFBYTE_STOP

Stop between each Direct Command. Each Command have an associated defining byte

I3C_DIRECT_WITHOUT_DEFBYTE_RESTART

Restart between each Direct Command then Stop request for last command. Each Command have not an associated defining byte

I3C_DIRECT_WITHOUT_DEFBYTE_STOP

Stop between each Direct Command. Each Command have not an associated defining byte

I3C_BROADCAST_WITH_DEFBYTE_RESTART

Restart between each Broadcast Command then Stop request for last command. Each Command have an associated defining byte

I3C_BROADCAST_WITH_DEFBYTE_STOP

Stop between each Broadcast Command. Each Command have an associated defining byte

I3C_BROADCAST_WITHOUT_DEFBYTE_RESTART

Restart between each Broadcast Command then Stop request for last command. Each Command have not an associated defining byte

I3C_BROADCAST_WITHOUT_DEFBYTE_STOP

Stop between each Broadcast Command. Each Command have not an associated defining byte

I3C_PRIVATE_WITH_ARB_RESTART

Restart between each I3C Private message then Stop request for last message. Each Message start with an arbitration header after start bit condition

I3C_PRIVATE_WITH_ARB_STOP

Stop between each I3C Private message. Each Message start with an arbitration header after start bit condition

I3C_PRIVATE_WITHOUT_ARB_RESTART

Restart between each I3C message then Stop request for last message. Each Message start with Target address after start bit condition

I3C_PRIVATE_WITHOUT_ARB_STOP

Stop between each I3C Private message. Each Message start with Target address after start bit condition

I2C_PRIVATE_WITH_ARB_RESTART

Restart between each I2C Private message then Stop request for last message. Each Message start with an arbitration header after start bit condition

I2C_PRIVATE_WITH_ARB_STOP

Stop between each I2C Private message. Each Message start with an arbitration header after start bit condition

I2C_PRIVATE_WITHOUT_ARB_RESTART

Restart between each I2C message then Stop request for last message. Each Message start with Target address after start bit condition

I2C_PRIVATE_WITHOUT_ARB_STOP

Stop between each I2C Private message. Each Message start with Target address after start bit condition

OWN ACTIVITY STATE

HAL_I3C_OWN_ACTIVITY_STATE_0

Own Controller Activity state 0

HAL_I3C_OWN_ACTIVITY_STATE_1

Own Controller Activity state 1

HAL_I3C_OWN_ACTIVITY_STATE_2

Own Controller Activity state 2

HAL_I3C_OWN_ACTIVITY_STATE_3

Own Controller Activity state 3

I3C PATTERN CONFIGURATION

HAL_I3C_TARGET_RESET_PATTERN

Target reset pattern

HAL_I3C_HDR_EXIT_PATTERN

HDR exit pattern

PAYLOAD SIZE

HAL_I3C_PAYLOAD_EMPTY

Empty payload, no additional data after IBI acknowledge

HAL_I3C_PAYLOAD_1_BYTE

One additional data byte after IBI acknowledge

HAL_I3C_PAYLOAD_2_BYTES

Two additional data bytes after IBI acknowledge

HAL_I3C_PAYLOAD_3_BYTES

Three additional data bytes after IBI acknowledge

HAL_I3C_PAYLOAD_4_BYTES

Four additional data bytes after IBI acknowledge

RESET PATTERN

HAL_I3C_RESET_PATTERN_DISABLE

Standard STOP condition emitted at the end of a frame

HAL_I3C_RESET_PATTERN_ENABLE

Reset pattern is inserted before the STOP condition of any emitted frame

RX FIFO THRESHOLD

HAL_I3C_RXFIFO_THRESHOLD_1_4

Rx Fifo Threshold is 1 byte

HAL_I3C_RXFIFO_THRESHOLD_4_4

Rx Fifo Threshold is 4 bytes

SDA HOLD TIME

HAL_I3C_SDA_HOLD_TIME_0_5

SDA hold time equal to 0.5 x ti3cclk

HAL_I3C_SDA_HOLD_TIME_1_5

SDA hold time equal to 1.5 x ti3cclk

STATUS FIFO STATE

HAL_I3C_STATUSFIFO_DISABLE

Status FIFO mode disable

HAL_I3C_STATUSFIFO_ENABLE

Status FIFO mode enable

I3C TARGET INTERRUPT

HAL_I3C_IT_IBIENDIE

IBI end interrupt enable

HAL_I3C_IT_CRUPDIE

controller-role update interrupt enable

HAL_I3C_IT_WKPIE

wakeup interrupt enable

HAL_I3C_IT_GETIE

GETxxx CCC interrupt enable

HAL_I3C_IT_STAIE

HAL_I3C_IT_DAUPDIE

ENTDAA/RSTDAA/SETNEWDA CCC interrupt enable

HAL_I3C_IT_MWLUPDIE

SETMWL CCC interrupt enable

HAL_I3C_IT_MRLUPDIE

SETMRL CCC interrupt enable

HAL_I3C_IT_RSTIE

reset pattern interrupt enable

HAL_I3C_IT_ASUPDIE

ENTASx CCC interrupt enable

HAL_I3C_IT_INTUPDIE

ENEC/DISEC CCC interrupt enable

HAL_I3C_IT_DEFIE

DEFTGTS CCC interrupt enable

HAL_I3C_IT_GRPIE

DEFGRPA CCC interrupt enable

HAL_I3C_ALL_TGT_ITS

TURNAROUND TIME TSCO

HAL_I3C_TURNAROUND_TIME_TSCO_LESS_12NS

clock-to-data turnaround time tSCO <= 12ns

HAL_I3C_TURNAROUND_TIME_TSCO_GREATER_12NS

clock-to-data turnaround time tSCO > 12ns

TX FIFO THRESHOLD

HAL_I3C_TXFIFO_THRESHOLD_1_4

Tx Fifo Threshold is 1 byte

HAL_I3C_TXFIFO_THRESHOLD_4_4

Tx Fifo Threshold is 4 bytes

I3C Utility Bus Type

I3C_PURE_I3C_BUS

Pure I3C bus, no I2C

I3C_MIXED_BUS

Mixed bus I3C and I2C

37 HAL ICACHE Generic Driver

37.1 ICACHE Firmware driver API description

The following section lists the various functions of the ICACHE library.

37.1.1 How to use this driver

The Texture Cache (ICACHE) is introduced on AXI read-only texture port of the GPU2D to improve performance when reading texture data from internal and external memories.

The ICACHE HAL driver can be used as follows:

1. Optionally configure the Instruction Cache mode with HAL_ICACHE_ConfigAssociativityMode() if the default configuration does not suit the application requirements.
2. Enable and disable the Instruction Cache with respectively HAL_ICACHE_Enable() and HAL_ICACHE_Disable(). Use HAL_ICACHE_IsEnabled() to get the Instruction Cache status. To ensure a deterministic cache behavior after power on, system reset or after a call to HAL_ICACHE_Disable(), the application must call HAL_ICACHE_WaitForInvalidateComplete(). Indeed on power on, system reset or cache disable, an automatic cache invalidation procedure is launched and the cache is bypassed until the operation completes.
3. Initiate the cache maintenance invalidation procedure with either HAL_ICACHE_Invalidate() (blocking mode) or HAL_ICACHE_Invalidate_IT() (interrupt mode). When interrupt mode is used, the callback function HAL_ICACHE_InvalidateCompleteCallback() is called when the invalidate procedure is complete. The function HAL_ICACHE_WaitForInvalidateComplete() may be called to wait for the end of the invalidate procedure automatically initiated when disabling the Instruction Cache with HAL_ICACHE_Disable(). The cache operation is bypassed during the invalidation procedure.
4. Use the performance monitoring counters for Hit and Miss with the following functions: HAL_ICACHE_Monitor_Start(), HAL_ICACHE_Monitor_Stop(), HAL_ICACHE_Monitor_Reset(), HAL_ICACHE_Monitor_GetHitValue() and HAL_ICACHE_Monitor_GetMissValue()

37.1.2 Detailed description of functions

HAL_ICACHE_Enable

Function name

HAL_StatusTypeDef HAL_ICACHE_Enable (void)

37.2 ICACHE Firmware driver defines

The following section lists the various define and macros of the module.

37.2.1 ICACHE

ICACHE

Flags

ICACHE_FLAG_BUSY

Busy flag

ICACHE_FLAG_BUSYEND

Busy end flag

ICACHE_FLAG_ERROR

Cache error flag

Flags and Interrupts Management

__HAL_ICACHE_ENABLE_IT

Description:

- Enable ICACHE interrupts.

Parameters:

- __INTERRUPT__: specifies the ICACHE interrupt sources to be enabled. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

__HAL_ICACHE_DISABLE_IT

Description:

- Disable ICACHE interrupts.

Parameters:

- __INTERRUPT__: specifies the ICACHE interrupt sources to be disabled. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

__HAL_ICACHE_GET_IT_SOURCE

Description:

- Check whether the specified ICACHE interrupt source is enabled or not.

Parameters:

- __INTERRUPT__: specifies the ICACHE interrupt source to check. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

Return value:

- The: state of __INTERRUPT__ (0 or 1).

__HAL_ICACHE_GET_FLAG

Description:

- Check whether the selected ICACHE flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - ICACHE_FLAG_BUSY Busy flag
  - ICACHE_FLAG_BUSYEND Busy end flag
  - ICACHE_FLAG_ERROR Cache error flag

Return value:

- The: state of __FLAG__ (0 or 1).

__HAL_ICACHE_CLEAR_FLAG

Description:

- Clear the selected ICACHE flags.

Parameters:

- __FLAG__: specifies the ICACHE flags to clear. This parameter can be any combination of the following values:
  - ICACHE_FLAG_BUSYEND Busy end flag
  - ICACHE_FLAG_ERROR Cache error flag

Interrupts

ICACHE_IT_BUSYEND

Busy end interrupt

ICACHE_IT_ERROR

Cache error interrupt

Monitor type

ICACHE_MONITOR_HIT_MISS

Hit & Miss monitoring

ICACHE_MONITOR_HIT

Hit monitoring

ICACHE_MONITOR_MISS

Miss monitoring

Ways selection

ICACHE_1WAY

1-way cache (direct mapped cache)

ICACHE_4WAYS

4-ways set associative cache (default)

38 HAL IRDA Generic Driver

38.1 IRDA Firmware driver registers structures

38.1.1 IRDA_InitTypeDef

IRDA_InitTypeDef is defined in the stm32n6xx_hal_irda.h

Data Fields

- ***uint32_t BaudRate***
- ***uint32_t WordLength***
- ***uint32_t Parity***
- ***uint32_t Mode***
- ***uint8_t Prescaler***
- ***uint16_t PowerMode***
- ***uint32_t ClockPrescaler***

Field Documentation

- ***uint32_t IRDA_InitTypeDef::BaudRate***
  This member configures the IRDA communication baud rate. The baud rate register is computed using the following formula: Baud Rate Register = ((usart_ker_ckpres) / ((hirda->Init.BaudRate))) where usart_ker_ckpres is the IRDA input clock divided by a prescaler
- ***uint32_t IRDA_InitTypeDef::WordLength***
  Specifies the number of data bits transmitted or received in a frame. This parameter can be a value of ***IRDAEx_Word_Length***
- ***uint32_t IRDA_InitTypeDef::Parity***
  Specifies the parity mode. This parameter can be a value of ***IRDA_Parity***
  Note:
  – When parity is enabled, the computed parity is inserted at the MSB position of the transmitted data (9th bit when the word length is set to 9 data bits; 8th bit when the word length is set to 8 data bits).
- ***uint32_t IRDA_InitTypeDef::Mode***
  Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of ***IRDA_Transfer_Mode***
- ***uint8_t IRDA_InitTypeDef::Prescaler***
  Specifies the Prescaler value for dividing the UART/USART source clock to achieve low-power frequency.
  Note:
  – Prescaler value 0 is forbidden
- ***uint16_t IRDA_InitTypeDef::PowerMode***
  Specifies the IRDA power mode. This parameter can be a value of ***IRDA_Low_Power***
- ***uint32_t IRDA_InitTypeDef::ClockPrescaler***
  Specifies the prescaler value used to divide the IRDA clock source. This parameter can be a value of ***IRDA_ClockPrescaler***.

38.1.2 __IRDA_HandleTypeDef

__IRDA_HandleTypeDef is defined in the stm32n6xx_hal_irda.h

Data Fields

- ***USART_TypeDef * Instance***
- ***IRDA_InitTypeDef Init***
- ***const uint8_t * pTxBuffPtr***
- ***uint16_t TxXferSize***
- ***__IO uint16_t TxXferCount***
- ***uint8_t * pRxBuffPtr***
- ***uint16_t RxXferSize***
- ***__IO uint16_t RxXferCount***

- ***uint16_t Mask***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_IRDA_StateTypeDef gState***
- ***__IO HAL_IRDA_StateTypeDef RxState***
- ***__IO uint32_t ErrorCode***
- ***void(* TxHalfCpltCallback***
- ***void(* TxCpltCallback***
- ***void(* RxHalfCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* AbortTransmitCpltCallback***
- ***void(* AbortReceiveCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***USART_TypeDef* __IRDA_HandleTypeDef::Instance***
  USART registers base address
- ***IRDA_InitTypeDef __IRDA_HandleTypeDef::Init***
  IRDA communication parameters
- ***const uint8_t* __IRDA_HandleTypeDef::pTxBuffPtr***
  Pointer to IRDA Tx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::TxXferSize***
  IRDA Tx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::TxXferCount***
  IRDA Tx Transfer Counter
- ***uint8_t* __IRDA_HandleTypeDef::pRxBuffPtr***
  Pointer to IRDA Rx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::RxXferSize***
  IRDA Rx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::RxXferCount***
  IRDA Rx Transfer Counter
- ***uint16_t __IRDA_HandleTypeDef::Mask***
  USART RX RDR register mask
- ***DMA_HandleTypeDef* __IRDA_HandleTypeDef::hdmatx***
  IRDA Tx DMA Handle parameters
- ***DMA_HandleTypeDef* __IRDA_HandleTypeDef::hdmarx***
  IRDA Rx DMA Handle parameters
- ***HAL_LockTypeDef __IRDA_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_IRDA_StateTypeDef __IRDA_HandleTypeDef::gState***
  IRDA state information related to global Handle management and also related to Tx operations. This parameter can be a value of **HAL_IRDA_StateTypeDef**
- ***__IO HAL_IRDA_StateTypeDef __IRDA_HandleTypeDef::RxState***
  IRDA state information related to Rx operations. This parameter can be a value of **HAL_IRDA_StateTypeDef**
- ***__IO uint32_t __IRDA_HandleTypeDef::ErrorCode***
  IRDA Error code
- ***void(* __IRDA_HandleTypeDef::TxHalfCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Tx Half Complete Callback
- ***void(* __IRDA_HandleTypeDef::TxCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Tx Complete Callback

- ***void(* __IRDA_HandleTypeDef::RxHalfCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Rx Half Complete Callback
- ***void(* __IRDA_HandleTypeDef::RxCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Rx Complete Callback
- ***void(* __IRDA_HandleTypeDef::ErrorCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Error Callback
- ***void(* __IRDA_HandleTypeDef::AbortCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Complete Callback
- ***void(* __IRDA_HandleTypeDef::AbortTransmitCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Transmit Complete Callback
- ***void(* __IRDA_HandleTypeDef::AbortReceiveCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Receive Complete Callback
- ***void(* __IRDA_HandleTypeDef::MspInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp Init callback
- ***void(* __IRDA_HandleTypeDef::MspDeInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp DeInit callback

38.2 IRDA Firmware driver API description

The following section lists the various functions of the IRDA library.

38.2.1 How to use this driver

The IRDA HAL driver can be used as follows:

1. Declare a IRDA_HandleTypeDef handle structure (eg. IRDA_HandleTypeDef hirda).
2. Initialize the IRDA low level resources by implementing the HAL_IRDA_MspInit() API in setting the associated USART or UART in IRDA mode:
   - Enable the USARTx/UARTx interface clock.
   - USARTx/UARTx pins configuration:
     - Enable the clock for the USARTx/UARTx GPIOs.
     - Configure these USARTx/UARTx pins (TX as alternate function pull-up, RX as alternate function Input).
   - NVIC configuration if you need to use interrupt process (HAL_IRDA_Transmit_IT() and HAL_IRDA_Receive_IT() APIs):
     - Configure the USARTx/UARTx interrupt priority.
     - Enable the NVIC USARTx/UARTx IRQ handle.
     - The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.
   - DMA Configuration if you need to use DMA process (HAL_IRDA_Transmit_DMA() and HAL_IRDA_Receive_DMA() APIs):
     - Declare a DMA handle structure for the Tx/Rx channel.
     - Enable the DMAx interface clock.
     - Configure the declared DMA handle structure with the required Tx/Rx parameters.
     - Configure the DMA Tx/Rx channel.
     - Associate the initialized DMA handle to the IRDA DMA Tx/Rx handle.
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
3. Program the Baud Rate, Word Length and Parity and Mode(Receiver/Transmitter), the normal or low power mode and the clock prescaler in the hirda handle Init structure.

4. Initialize the IRDA registers by calling the HAL_IRDA_Init() API:
   – This API configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL_IRDA_MspInit() API.

Note: The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.

5. Three operation modes are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_IRDA_Transmit()
- Receive an amount of data in blocking mode using HAL_IRDA_Receive()

Interrupt mode IO operation

- Send an amount of data in non-blocking mode using HAL_IRDA_Transmit_IT()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL_IRDA_Receive_IT()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

DMA mode IO operation

- Send an amount of data in non-blocking mode (DMA) using HAL_IRDA_Transmit_DMA()
- At transmission half of transfer HAL_IRDA_TxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxHalfCpltCallback()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL_IRDA_Receive_DMA()
- At reception half of transfer HAL_IRDA_RxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxHalfCpltCallback()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

IRDA HAL driver macros list

Below the list of most used macros in IRDA HAL driver.

- __HAL_IRDA_ENABLE: Enable the IRDA peripheral
- __HAL_IRDA_DISABLE: Disable the IRDA peripheral
- __HAL_IRDA_GET_FLAG : Check whether the specified IRDA flag is set or not
- __HAL_IRDA_CLEAR_FLAG : Clear the specified IRDA pending flag
- __HAL_IRDA_ENABLE_IT: Enable the specified IRDA interrupt
- __HAL_IRDA_DISABLE_IT: Disable the specified IRDA interrupt
- __HAL_IRDA_GET_IT_SOURCE: Check whether or not the specified IRDA interrupt is enabled

Note: You can refer to the IRDA HAL driver header file for more useful macros

38.2.2 Callback registration

The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_IRDA_RegisterCallback() to register a user callback. Function HAL_IRDA_RegisterCallback() allows to register following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_IRDA_UnRegisterCallback() to reset a callback to the default weak function. HAL_IRDA_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit.

By default, after the HAL_IRDA_Init() and when the state is HAL_IRDA_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_IRDA_TxCpltCallback(), HAL_IRDA_RxHalfCpltCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak functions in the HAL_IRDA_Init() and HAL_IRDA_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_IRDA_Init() and HAL_IRDA_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_IRDA_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_IRDA_STATE_READY or HAL_IRDA_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_IRDA_RegisterCallback() before calling HAL_IRDA_DeInit() or HAL_IRDA_Init() function.

When The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak callbacks are used.

38.2.3 Detailed description of functions

IRDA Exported Macros

__HAL_IRDA_RESET_HANDLE_STATE

Description:

- Reset IRDA handle state.

Parameters:

- __HANDLE__: IRDA handle.

Return value:

- None

__HAL_IRDA_FLUSH_DRREGISTER

Description:

- Flush the IRDA DR register.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FLAG

Description:

- Clear the specified IRDA pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - IRDA_CLEAR_PEF
  - IRDA_CLEAR_FEF
  - IRDA_CLEAR_NEF
  - IRDA_CLEAR_OREF
  - IRDA_CLEAR_TCF
  - IRDA_CLEAR_IDLEF

Return value:

- None

__HAL_IRDA_CLEAR_PEFLAG

Description:

- Clear the IRDA PE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FEFLAG

Description:

- Clear the IRDA FE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_NEFLAG

Description:

- Clear the IRDA NE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_OREFLAG

Description:

- Clear the IRDA ORE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_IDLEFLAG

Description:

- Clear the IRDA IDLE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_GET_FLAG

Description:

- Check whether the specified IRDA flag is set or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - IRDA_FLAG_REACK Receive enable acknowledge flag
  - IRDA_FLAG_TEACK Transmit enable acknowledge flag
  - IRDA_FLAG_BUSY Busy flag
  - IRDA_FLAG_ABRF Auto Baud rate detection flag
  - IRDA_FLAG_ABRE Auto Baud rate detection error flag
  - IRDA_FLAG_TXE Transmit data register empty flag
  - IRDA_FLAG_TC Transmission Complete flag
  - IRDA_FLAG_RXNE Receive data register not empty flag
  - IRDA_FLAG_ORE OverRun Error flag
  - IRDA_FLAG_NE Noise Error flag
  - IRDA_FLAG_FE Framing Error flag
  - IRDA_FLAG_PE Parity Error flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_IRDA_ENABLE_IT

Description:

- Enable the specified IRDA interrupt.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to enable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:

- None

__HAL_IRDA_DISABLE_IT

Description:

- Disable the specified IRDA interrupt.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to disable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:

- None

__HAL_IRDA_GET_IT

Description:

- Check whether the specified IRDA interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ORE OverRun Error interrupt
  - IRDA_IT_NE Noise Error interrupt
  - IRDA_IT_FE Framing Error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:

- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_GET_IT_SOURCE

Description:

- Check whether the specified IRDA interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ERR Framing, overrun or noise error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:

- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_CLEAR_IT

Description:

- Clear the specified IRDA ISR flag, in setting the proper ICR register flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __IT_CLEAR__: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt This parameter can be one of the following values:
  - IRDA_CLEAR_PEF Parity Error Clear Flag
  - IRDA_CLEAR_FEF Framing Error Clear Flag
  - IRDA_CLEAR_NEF Noise detected Clear Flag
  - IRDA_CLEAR_OREF OverRun Error Clear Flag
  - IRDA_CLEAR_TCF Transmission Complete Clear Flag

Return value:

- None

__HAL_IRDA_SEND_REQ

Description:

- Set a specific IRDA request flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __REQ__: specifies the request flag to set This parameter can be one of the following values:
  - IRDA_AUTOBAUD_REQUEST Auto-Baud Rate Request
  - IRDA_RXDATA_FLUSH_REQUEST Receive Data flush Request
  - IRDA_TXDATA_FLUSH_REQUEST Transmit data flush Request

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_ENABLE

Description:

- Enable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_DISABLE

Description:

- Disable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ENABLE

Description:

- Enable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_DISABLE

Description:

- Disable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

40 HAL IWDG Generic Driver

40.1 IWDG Firmware driver registers structures

40.1.1 IWDG_InitTypeDef

IWDG_InitTypeDef is defined in the stm32n6xx_hal_iwdg.h

Data Fields

- ***uint32_t Prescaler***
- ***uint32_t Reload***
- ***uint32_t Window***
- ***uint32_t EWI***

Field Documentation

- ***uint32_t IWDG_InitTypeDef::Prescaler***
  Select the prescaler of the IWDG. This parameter can be a value of ***IWDG_Prescaler***
- ***uint32_t IWDG_InitTypeDef::Reload***
  Specifies the IWDG down-counter reload value. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF
- ***uint32_t IWDG_InitTypeDef::Window***
  Specifies the window value to be compared to the down-counter. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF
- ***uint32_t IWDG_InitTypeDef::EWI***
  Specifies if IWDG Early Wakeup Interrupt is enable or not and the comparator value. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF value 0 means that EWI is disabled

40.1.2 __IWDG_HandleTypeDef

__IWDG_HandleTypeDef is defined in the stm32n6xx_hal_iwdg.h

Data Fields

- ***IWDG_TypeDef * Instance***
- ***IWDG_InitTypeDef Init***
- ***void(* EwiCallback***
- ***void(* MspInitCallback***

Field Documentation

- ***IWDG_TypeDef* __IWDG_HandleTypeDef::Instance***
  Register base address
- ***IWDG_InitTypeDef __IWDG_HandleTypeDef::Init***
  IWDG required parameters
- ***void(* __IWDG_HandleTypeDef::EwiCallback)(struct __IWDG_HandleTypeDef *hiwdg)***
  IWDG Early WakeUp Interrupt callback
- ***void(* __IWDG_HandleTypeDef::MspInitCallback)(struct __IWDG_HandleTypeDef *hiwdg)***
  IWDG Msp Init callback

40.2 IWDG Firmware driver API description

The following section lists the various functions of the IWDG library.

40.2.1 IWDG Generic features

- The IWDG can be started by either software or hardware (configurable through option byte).
- The IWDG is clocked by the Low-Speed Internal clock (LSI) and thus stays active even if the main clock fails.

- Once the IWDG is started, the LSI is forced ON and both cannot be disabled. The counter starts counting down from the reset value (0xFFF). When it reaches the end of count value (0x000) a reset signal is generated (IWDG reset).
- Whenever the key value 0x0000 AAAA is written in the IWDG_KR register, the IWDG_RLR value is reloaded into the counter and the watchdog reset is prevented.
- The IWDG is implemented in the VDD voltage domain that is still functional in STOP and STANDBY mode (IWDG reset can wake up the CPU from STANDBY). IWDGRST flag in RCC_CSR register can be used to inform when an IWDG reset occurs.
- Debug mode: When the microcontroller enters debug mode (core halted), the IWDG counter either continues to work normally or stops, depending on DBG_IWDG_STOP configuration bit in DBG module, accessible through __HAL_DBGMCU_FREEZE_IWDG() and __HAL_DBGMCU_UNFREEZE_IWDG() macros.

Min-max timeout value @32KHz (LSI): ~125us / ~131.04s The IWDG timeout may vary due to LSI clock frequency dispersion. STM32N6xx devices provide the capability to measure the LSI clock frequency (LSI clock is internally connected to TIM16 CH1 input capture). The measured value can be used to have an IWDG timeout with an acceptable accuracy.

Default timeout value (necessary for IWDG_SR status register update): Constant LSI_VALUE is defined based on the nominal LSI clock frequency. This frequency being subject to variations as mentioned above, the default timeout value (defined through constant HAL_IWDG_DEFAULT_TIMEOUT below) may become too short or too long. In such cases, this default timeout value can be tuned by redefining the constant LSI_VALUE at user-application level (based, for instance, on the measured LSI clock frequency as explained above).

40.2.2 How to use this driver

1. Register callback to treat Iwdg interrupt and MspInit using HAL_IWDG_RegisterCallback().
   - Provide exiting handle as first parameter.
   - Provide which callback will be registered using one value from HAL_IWDG_CallbackIDTypeDef.
   - Provide callback function pointer.
2. Use IWDG using HAL_IWDG_Init() function to :
   - Enable instance by writing Start keyword in IWDG_KEY register. LSI clock is forced ON and IWDG counter starts counting down.
   - Enable write access to configuration registers: IWDG_PR, IWDG_RLR, IWDG_WINR and EWCR.
   - Configure the IWDG prescaler and counter reload value. This reload value will be loaded in the IWDG counter each time the watchdog is reloaded, then the IWDG will start counting down from this value.
   - Depending on window parameter:
     - If Window Init parameter is same as Window register value, nothing more is done but reload counter value in order to exit function with exact time base.
     - Else modify Window register. This will automatically reload watchdog counter.
   - Depending on Early Wakeup Interrupt parameter:
     - If EWI is set to disable, comparator is set to 0, interrupt is disable & flag is clear.
     - Else modify EWCR register, setting comparator value, enable interrupt & clear flag.
   - Wait for status flags to be reset.
3. Then the application program must refresh the IWDG counter at regular intervals during normal operation to prevent an MCU reset, using HAL_IWDG_Refresh() function.

IWDG HAL driver macros list

Below the list of most used macros in IWDG HAL driver:

- __HAL_IWDG_START: Enable the IWDG peripheral
- __HAL_IWDG_RELOAD_COUNTER: Reloads IWDG counter with value defined in the reload register

40.3.1 IWDG

IWDG

IWDG Active Status

IWDG_STATUS_DISABLE

IWDG_STATUS_ENABLE

IWDG Early Wakeup Interrupt Mode

IWDG_EWI_DISABLE

EWI Disable

IWDG Exported Macros

__HAL_IWDG_START

Description:

- Enable the IWDG peripheral.

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

__HAL_IWDG_RELOAD_COUNTER

Description:

- Reload IWDG counter with value defined in the reload register (write access to IWDG_PR, IWDG_RLR, IWDG_WINR and EWCR registers disabled).

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

IWDG Prescaler

IWDG_PRESCALER_4

IWDG prescaler set to 4

IWDG_PRESCALER_8

IWDG prescaler set to 8

IWDG_PRESCALER_16

IWDG prescaler set to 16

IWDG_PRESCALER_32

IWDG prescaler set to 32

IWDG_PRESCALER_64

IWDG prescaler set to 64

IWDG_PRESCALER_128

IWDG prescaler set to 128

IWDG_PRESCALER_256

IWDG prescaler set to 256

IWDG_PRESCALER_512

IWDG prescaler set to 512

IWDG_PRESCALER_1024

IWDG prescaler set to 1024

IWDG Window option

IWDG_WINDOW_DISABLE

41 HAL JPEG Generic Driver

41.1 JPEG Firmware driver registers structures

41.1.1 JPEG_ConfTypeDef

JPEG_ConfTypeDef is defined in the stm32n6xx_hal_jpeg.h

Data Fields

- ***uint32_t ColorSpace***
- ***uint32_t ChromaSubsampling***
- ***uint32_t ImageHeight***
- ***uint32_t ImageWidth***
- ***uint32_t ImageQuality***

Field Documentation

- ***uint32_t JPEG_ConfTypeDef::ColorSpace***
  Image Color space : gray-scale, YCBCR, RGB or CMYK This parameter can be a value of ***JPEG_ColorSpace***
- ***uint32_t JPEG_ConfTypeDef::ChromaSubsampling***
  Chroma Subsampling in case of YCBCR or CMYK color space, 0-> 4:4:4 , 1-> 4:2:2, 2 -> 4:1:1, 3 -> 4:2:0 This parameter can be a value of ***JPEG_ChromaSubsampling***
- ***uint32_t JPEG_ConfTypeDef::ImageHeight***
  Image height : number of lines
- ***uint32_t JPEG_ConfTypeDef::ImageWidth***
  Image width : number of pixels per line
- ***uint32_t JPEG_ConfTypeDef::ImageQuality***
  Quality of the JPEG encoding : from 1 to 100

41.1.2 JPEG_HandleTypeDef

JPEG_HandleTypeDef is defined in the stm32n6xx_hal_jpeg.h

Data Fields

- ***JPEG_TypeDef * Instance***
- ***JPEG_ConfTypeDef Conf***
- ***uint8_t * pJpegInBuffPtr***
- ***uint8_t * pJpegOutBuffPtr***
- ***__IO uint32_t JpegInCount***

- ***DMA_HandleTypeDef * hdmain***
- ***DMA_HandleTypeDef * hdmaout***
- ***uint8_t CustomQuanTable***
- ***uint8_t * QuantTable0***
- ***uint8_t * QuantTable1***
- ***uint8_t * QuantTable2***
- ***uint8_t * QuantTable3***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_JPEG_STATETypeDef State***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t Context***

Field Documentation

- ***JPEG_TypeDef* JPEG_HandleTypeDef::Instance***
  JPEG peripheral register base address
- ***JPEG_ConfTypeDef JPEG_HandleTypeDef::Conf***
  Current JPEG encoding/decoding parameters
- ***uint8_t* JPEG_HandleTypeDef::pJpegInBuffPtr***
  Pointer to JPEG processing (encoding, decoding,...) input buffer
- ***uint8_t* JPEG_HandleTypeDef::pJpegOutBuffPtr***
  Pointer to JPEG processing (encoding, decoding,...) output buffer
- ***__IO uint32_t JPEG_HandleTypeDef::JpegInCount***
  Internal Counter of input data
- ***__IO uint32_t JPEG_HandleTypeDef::JpegOutCount***
  Internal Counter of output data
- ***uint32_t JPEG_HandleTypeDef::InDataLength***
  Input Buffer Length in Bytes
- ***uint32_t JPEG_HandleTypeDef::OutDataLength***
  Output Buffer Length in Bytes
- ***DMA_HandleTypeDef* JPEG_HandleTypeDef::hdmain***
  JPEG In DMA handle parameters
- ***DMA_HandleTypeDef* JPEG_HandleTypeDef::hdmaout***
  JPEG Out DMA handle parameters
- ***uint8_t JPEG_HandleTypeDef::CustomQuanTable***
  If set to 1 specify that user customized quantization tables are used
- ***uint8_t* JPEG_HandleTypeDef::QuantTable0***
  Basic Quantization Table for component 0
- ***uint8_t* JPEG_HandleTypeDef::QuantTable1***
  Basic Quantization Table for component 1
- ***uint8_t* JPEG_HandleTypeDef::QuantTable2***
  Basic Quantization Table for component 2
- ***uint8_t* JPEG_HandleTypeDef::QuantTable3***
  Basic Quantization Table for component 3
- ***HAL_LockTypeDef JPEG_HandleTypeDef::Lock***
  JPEG locking object
- ***__IO HAL_JPEG_STATETypeDef JPEG_HandleTypeDef::State***
  JPEG peripheral state
- ***__IO uint32_t JPEG_HandleTypeDef::ErrorCode***
  JPEG Error code
- ***__IO uint32_t JPEG_HandleTypeDef::Context***
  JPEG Internal context

41.2 JPEG Firmware driver API description

The following section lists the various functions of the JPEG library.

41.2.1 How to use this driver

1. Initialize the JPEG peripheral using HAL_JPEG_Init : No initialization parameters are required. Only the call to HAL_JPEG_Init is necessary to initialize the JPEG peripheral.
2. If operation is JPEG encoding use function HAL_JPEG_ConfigEncoding to set the encoding parameters (mandatory before calling the encoding function). the application can change the encoding parameter ImageQuality from 1 to 100 to obtain a more or less quality (visual quality vs the original row image), and inversely more or less jpg file size.
3. Note that for decoding operation the JPEG peripheral output data are organized in YCbCr blocks called MCU (Minimum Coded Unit) as defioned in the JPEG specification ISO/IEC 10918-1 standard. It is up to the application to transform these YCbCr blocks to RGB data that can be display. Respectively, for Encoding operation the JPEG peripheral input should be organized in YCbCr MCU blocks. It is up to the application to perform the necessary RGB to YCbCr MCU blocks transformation before feeding the JPEG peripheral with data.

4. Use functions HAL_JPEG_Encode and HAL_JPEG_Decode to start respectively a JPEG encoding/decoding operation in polling method (blocking).
5. Use functions HAL_JPEG_Encode_IT and HAL_JPEG_Decode_IT to start respectively a JPEG encoding/ decoding operation with Interrupt method (not blocking).
6. Use functions HAL_JPEG_Encode_DMA and HAL_JPEG_Decode_DMA to start respectively a JPEG encoding/decoding operation with DMA method (not blocking).
7. Callback HAL_JPEG_InfoReadyCallback is asserted if the current operation is a JPEG decoding to provide the application with JPEG image parameters. This callback is asserted when the JPEG peripheral successfully parse the JPEG header.
8. Callback HAL_JPEG_GetDataCallback is asserted for both encoding and decoding operations to inform the application that the input buffer has been consumed by the peripheral and to ask for a new data chunk if the operation (encoding/decoding) has not been complete yet.
   - This CallBack should be implemented in the application side. It should call the function HAL_JPEG_ConfigInputBuffer if new input data are available, or call HAL_JPEG_Pause with parameter XferSelection set to JPEG_PAUSE_RESUME_INPUT to inform the JPEG HAL driver that the ongoing operation shall pause waiting for the application to provide a new input data chunk. Once the application succeed getting new data and if the input has been paused, the application can call the function HAL_JPEG_ConfigInputBuffer to set the new input buffer and size, then resume the JPEG HAL input by calling new function HAL_JPEG_Resume. If the application has ended feeding the HAL JPEG with input data (no more input data), the application Should call the function HAL_JPEG_ConfigInputBuffer (within the callback HAL_JPEG_GetDataCallback) with the parameter InDataLength set to zero.
   - The mechanism of HAL_JPEG_ConfigInputBuffer/HAL_JPEG_Pause/HAL_JPEG_Resume allows to the application to provide the input data (for encoding or decoding) by chunks. If the new input data chunk is not available (because data should be read from an input file for example) the application can pause the JPEG input (using function HAL_JPEG_Pause) Once the new input data chunk is available (read from a file for example), the application can call the function HAL_JPEG_ConfigInputBuffer to provide the HAL with the new chunk then resume the JPEG HAL input by calling function HAL_JPEG_Resume.
   - The application can call functions HAL_JPEG_ConfigInputBuffer then HAL_JPEG_Resume. any time (outside the HAL_JPEG_GetDataCallback) Once the new input chunk data available. However, to keep data coherency, the function HAL_JPEG_Pause must be imperatively called (if necessary) within the callback HAL_JPEG_GetDataCallback, i.e when the HAL JPEG has ended Transferring the previous chunk buffer to the JPEG peripheral.
9. Callback HAL_JPEG_DataReadyCallback is asserted when the HAL JPEG driver has filled the given output buffer with the given size.
   - This CallBack should be implemented in the application side. It should call the function HAL_JPEG_ConfigOutputBuffer to provide the HAL JPEG driver with the new output buffer location and size to be used to store next data chunk. if the application is not ready to provide the output chunk location then it can call the function HAL_JPEG_Pause with parameter XferSelection set to JPEG_PAUSE_RESUME_OUTPUT to inform the JPEG HAL driver that it shall pause output data. Once the application is ready to receive the new data chunk (output buffer location free or available) it should call the function HAL_JPEG_ConfigOutputBuffer to provide the HAL JPEG driver with the new output chunk buffer location and size, then call HAL_JPEG_Resume to inform the HAL that it shall resume outputting data in the given output buffer.
   - The mechanism of HAL_JPEG_ConfigOutputBuffer/HAL_JPEG_Pause/HAL_JPEG_Resume allows the application to receive data from the JPEG peripheral by chunks. when a chunk is received, the application can pause the HAL JPEG output data to be able to process these received data (YCbCr to RGB conversion in case of decoding or data storage in case of encoding).
   - The application can call functions HAL_JPEG_ ConfigOutputBuffer then HAL_JPEG_Resume. any time (outside the HAL_JPEG_DataReadyCallback) Once the output data buffer is free to use. However, to keep data coherency, the function HAL_JPEG_Pause must be imperatively called (if necessary) within the callback HAL_JPEG_ DataReadyCallback, i.e when the HAL JPEG has ended Transferring the previous chunk buffer from the JPEG peripheral to the application.
10. Callback HAL_JPEG_EncodeCpltCallback is asserted when the HAL JPEG driver has ended the current JPEG encoding operation, and all output data has been transmitted to the application.
11. Callback HAL_JPEG_DecodeCpltCallback is asserted when the HAL JPEG driver has ended the current JPEG decoding operation. and all output data has been transmitted to the application.
12. Callback HAL_JPEG_ErrorCallback is asserted when an error occurred during the current operation. the application can call the function HAL_JPEG_GetError() to retrieve the error codes.

13. By default the HAL JPEG driver uses the default quantization tables as provide in the JPEG specification (ISO/IEC 10918-1 standard) for encoding. User can change these default tables if necessary using the function HAL_JPEG_SetUserQuantTables Note that for decoding the quantization tables are automatically extracted from the JPEG header.
14. To control JPEG state you can use the following function: HAL_JPEG_GetState()

JPEG HAL driver macros list

Below the list of most used macros in JPEG HAL driver.

- __HAL_JPEG_RESET_HANDLE_STATE : Reset JPEG handle state.
- __HAL_JPEG_ENABLE : Enable the JPEG peripheral.
- __HAL_JPEG_DISABLE : Disable the JPEG peripheral.
- __HAL_JPEG_GET_FLAG : Check the specified JPEG status flag.
- __HAL_JPEG_CLEAR_FLAG : Clear the specified JPEG status flag.
- __HAL_JPEG_ENABLE_IT : Enable the specified JPEG Interrupt.
- __HAL_JPEG_DISABLE_IT : Disable the specified JPEG Interrupt.
- __HAL_JPEG_GET_IT_SOURCE : returns the state of the specified JPEG Interrupt (Enabled or disabled).

Callback registration

41.2.2 Detailed description of functions

HAL_JPEG_Init

Function name

HAL_StatusTypeDef HAL_JPEG_Init (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_DeInit

Function name

HAL_StatusTypeDef HAL_JPEG_DeInit (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_MspInit

Function name

void HAL_JPEG_MspInit (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_MspDeInit

Function name

void HAL_JPEG_MspDeInit (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_ConfigEncoding

Function name

HAL_StatusTypeDef HAL_JPEG_ConfigEncoding (JPEG_HandleTypeDef * hjpeg, const JPEG_ConfTypeDef * pConf)

Function description

HAL_JPEG_GetInfo

Function name

HAL_StatusTypeDef HAL_JPEG_GetInfo (JPEG_HandleTypeDef * hjpeg, JPEG_ConfTypeDef * pInfo)

Function description

HAL_JPEG_EnableHeaderParsing

Function name

HAL_StatusTypeDef HAL_JPEG_EnableHeaderParsing (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_DisableHeaderParsing

Function name

HAL_StatusTypeDef HAL_JPEG_DisableHeaderParsing (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_SetUserQuantTables

Function name

HAL_StatusTypeDef HAL_JPEG_SetUserQuantTables (JPEG_HandleTypeDef * hjpeg, uint8_t * QTable0, uint8_t * QTable1, uint8_t * QTable2, uint8_t * QTable3)

Function description

HAL_JPEG_Encode

Function name

HAL_StatusTypeDef HAL_JPEG_Encode (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength, uint32_t Timeout)

Function description

HAL_JPEG_Decode

Function name

HAL_StatusTypeDef HAL_JPEG_Decode (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength, uint32_t Timeout)

Function description

HAL_JPEG_Encode_IT

Function name

HAL_StatusTypeDef HAL_JPEG_Encode_IT (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

HAL_JPEG_Decode_IT

Function name

HAL_StatusTypeDef HAL_JPEG_Decode_IT (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength)

Function description

HAL_JPEG_Encode_DMA

Function name

HAL_StatusTypeDef HAL_JPEG_Encode_DMA (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

HAL_JPEG_Decode_DMA

Function name

HAL_StatusTypeDef HAL_JPEG_Decode_DMA (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength)

Function description

HAL_JPEG_Pause

Function name

HAL_StatusTypeDef HAL_JPEG_Pause (JPEG_HandleTypeDef * hjpeg, uint32_t XferSelection)

Function description

HAL_JPEG_Resume

Function name

HAL_StatusTypeDef HAL_JPEG_Resume (JPEG_HandleTypeDef * hjpeg, uint32_t XferSelection)

Function description

HAL_JPEG_ConfigInputBuffer

Function name

void HAL_JPEG_ConfigInputBuffer (JPEG_HandleTypeDef * hjpeg, uint8_t * pNewInputBuffer, uint32_t InDataLength)

Function description

HAL_JPEG_ConfigOutputBuffer

Function name

void HAL_JPEG_ConfigOutputBuffer (JPEG_HandleTypeDef * hjpeg, uint8_t * pNewOutputBuffer, uint32_t OutDataLength)

Function description

HAL_JPEG_Abort

Function name

HAL_StatusTypeDef HAL_JPEG_Abort (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_InfoReadyCallback

Function name

void HAL_JPEG_InfoReadyCallback (JPEG_HandleTypeDef * hjpeg, JPEG_ConfTypeDef * pInfo)

Function description

HAL_JPEG_EncodeCpltCallback

Function name

void HAL_JPEG_EncodeCpltCallback (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_DecodeCpltCallback

Function name

void HAL_JPEG_DecodeCpltCallback (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_ErrorCallback

Function name

void HAL_JPEG_ErrorCallback (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_GetDataCallback

Function name

void HAL_JPEG_GetDataCallback (JPEG_HandleTypeDef * hjpeg, uint32_t NbDecodedData)

Function description

HAL_JPEG_DataReadyCallback

Function name

void HAL_JPEG_DataReadyCallback (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

HAL_JPEG_IRQHandler

Function name

void HAL_JPEG_IRQHandler (JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_GetState

Function name

HAL_JPEG_STATETypeDef HAL_JPEG_GetState (const JPEG_HandleTypeDef * hjpeg)

Function description

HAL_JPEG_GetError

Function name

uint32_t HAL_JPEG_GetError (const JPEG_HandleTypeDef * hjpeg)

Function description

41.3 JPEG Firmware driver defines

The following section lists the various define and macros of the module.

41.3.1 JPEG

JPEG

JPEG Chrominance Sampling

JPEG_444_SUBSAMPLING

Chroma Subsampling 4:4:4

JPEG_420_SUBSAMPLING

Chroma Subsampling 4:2:0

JPEG_422_SUBSAMPLING

Chroma Subsampling 4:2:2

JPEG ColorSpace

JPEG_GRAYSCALE_COLORSPACE

JPEG_YCBCR_COLORSPACE

JPEG_CMYK_COLORSPACE

JPEG Error Code definition

HAL_JPEG_ERROR_NONE

No error

HAL_JPEG_ERROR_HUFF_TABLE

HUffman Table programming error

HAL_JPEG_ERROR_QUANT_TABLE

Quantization Table programming error

HAL_JPEG_ERROR_DMA

DMA transfer error

HAL_JPEG_ERROR_TIMEOUT

Timeout error

JPEG Exported Macros

__HAL_JPEG_RESET_HANDLE_STATE

Description:

- Reset JPEG handle state.

Parameters:

- __HANDLE__: specifies the JPEG handle.

Return value:

- None

__HAL_JPEG_ENABLE

Description:

- Enable the JPEG peripheral.

Parameters:

- __HANDLE__: specifies the JPEG handle.

Return value:

- None

__HAL_JPEG_DISABLE

Description:

- Disable the JPEG peripheral.

Parameters:

- __HANDLE__: specifies the JPEG handle.

Return value:

- None

__HAL_JPEG_GET_FLAG

Description:

- Check the specified JPEG status flag.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __FLAG__: specifies the flag to check This parameter can be one of the following values:
  - JPEG_FLAG_IFTF : The input FIFO is not full and is below its threshold flag
  - JPEG_FLAG_IFNFF : The input FIFO Not Full Flag, a data can be written
  - JPEG_FLAG_OFTF : The output FIFO is not empty and has reach its threshold
  - JPEG_FLAG_OFNEF : The output FIFO is not empty, a data is available
  - JPEG_FLAG_EOCF : JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO
  - JPEG_FLAG_HPDF : JPEG Codec has finished the parsing of the headers and the internal registers have been updated
  - JPEG_FLAG_COF : JPEG Codec operation on going flag

Return value:

- __HAL_JPEG_GET_FLAG: : returns The new state of __FLAG__ (TRUE or FALSE)

__HAL_JPEG_CLEAR_FLAG

Description:

- Clear the specified JPEG status flag.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __FLAG__: specifies the flag to clear This parameter can be one of the following values:
  - JPEG_FLAG_EOCF : JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO
  - JPEG_FLAG_HPDF : JPEG Codec has finished the parsing of the headers

Return value:

- None

__HAL_JPEG_ENABLE_IT

Description:

- Enable Interrupt.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to enable This parameter can be one of the following values:
  - JPEG_IT_IFT : Input FIFO Threshold Interrupt
  - JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  - JPEG_IT_OFT : Output FIFO Threshold Interrupt
  - JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  - JPEG_IT_EOC : End of Conversion Interrupt
  - JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- No: return

__HAL_JPEG_DISABLE_IT

Description:

- Disable Interrupt.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to disable This parameter can be one of the following values:
  - JPEG_IT_IFT : Input FIFO Threshold Interrupt
  - JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  - JPEG_IT_OFT : Output FIFO Threshold Interrupt
  - JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  - JPEG_IT_EOC : End of Conversion Interrupt
  - JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- No: return

Notes:

- To disable an IT we must use MODIFY_REG macro to avoid writing "1" to the FIFO flush bits located in the same IT enable register (CR register).

__HAL_JPEG_GET_IT_SOURCE

Description:

- Get Interrupt state.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to check This parameter can be one of the following values:
  - JPEG_IT_IFT : Input FIFO Threshold Interrupt
  - JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  - JPEG_IT_OFT : Output FIFO Threshold Interrupt
  - JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  - JPEG_IT_EOC : End of Conversion Interrupt
  - JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- returns: The new state of __INTERRUPT__ (Enabled or disabled)

JPEG Flag definition

JPEG_FLAG_IFTF

Input FIFO is not full and is below its threshold flag

JPEG_FLAG_IFNFF

Input FIFO Not Full Flag, a data can be written

JPEG_FLAG_OFTF

Output FIFO is not empty and has reach its threshold

JPEG_FLAG_OFNEF

Output FIFO is not empty, a data is available

JPEG_FLAG_EOCF

JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO

JPEG_FLAG_HPDF

JPEG Codec has finished the parsing of the headers and the internal registers have been updated

JPEG_FLAG_COF

JPEG Codec operation on going flag

JPEG_FLAG_ALL

JPEG Codec All previous flag

JPEG Image Quality

JPEG_IMAGE_QUALITY_MIN

Minimum JPEG quality

JPEG_IMAGE_QUALITY_MAX

Maximum JPEG quality

JPEG Interrupt configuration definition

JPEG_IT_IFT

Input FIFO Threshold Interrupt

JPEG_IT_IFNF

Input FIFO Not Full Interrupt

JPEG_IT_OFT

Output FIFO Threshold Interrupt

JPEG_IT_OFNE

Output FIFO Not Empty Interrupt

JPEG_IT_EOC

End of Conversion Interrupt

JPEG_IT_HPD

Header Parsing Done Interrupt

JPEG Process Pause Resume definition

JPEG_PAUSE_RESUME_INPUT

Pause/Resume Input FIFO Xfer

JPEG_PAUSE_RESUME_OUTPUT

Pause/Resume Output FIFO Xfer

JPEG_PAUSE_RESUME_INPUT_OUTPUT

Pause/Resume Input and Output FIFO Xfer

JPEG Quantization Table Size

JPEG_QUANT_TABLE_SIZE

JPEG Quantization Table Size in bytes

42 HAL LPTIM Generic Driver

42.1 LPTIM Firmware driver registers structures

42.1.1 LPTIM_ClockConfigTypeDef

LPTIM_ClockConfigTypeDef is defined in the stm32n6xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Prescaler***

Field Documentation

- ***uint32_t LPTIM_ClockConfigTypeDef::Source***
  Selects the clock source. This parameter can be a value of ***LPTIM_Clock_Source***
- ***uint32_t LPTIM_ClockConfigTypeDef::Prescaler***
  Specifies the counter clock Prescaler. This parameter can be a value of ***LPTIM_Clock_Prescaler***

42.1.2 LPTIM_ULPClockConfigTypeDef

LPTIM_ULPClockConfigTypeDef is defined in the stm32n6xx_hal_lptim.h

Data Fields

- ***uint32_t Polarity***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_ULPClockConfigTypeDef::Polarity***
  Selects the polarity of the active edge for the counter unit if the ULPTIM input is selected. Note: This parameter is used only when Ultra low power clock source is used. Note: If the polarity is configured on 'both edges', an auxiliary clock (one of the Low power oscillator) must be active. This parameter can be a value of ***LPTIM_Clock_Polarity***
- ***uint32_t LPTIM_ULPClockConfigTypeDef::SampleTime***
  Selects the clock sampling time to configure the clock glitch filter. Note: This parameter is used only when Ultra low power clock source is used. This parameter can be a value of ***LPTIM_Clock_Sample_Time***

42.1.3 LPTIM_TriggerConfigTypeDef

LPTIM_TriggerConfigTypeDef is defined in the stm32n6xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t ActiveEdge***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_TriggerConfigTypeDef::Source***
  Selects the Trigger source. This parameter can be a value of ***LPTIM_Trigger_Source***
- ***uint32_t LPTIM_TriggerConfigTypeDef::ActiveEdge***
  Selects the Trigger active edge. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_External_Trigger_Polarity***
- ***uint32_t LPTIM_TriggerConfigTypeDef::SampleTime***
  Selects the trigger sampling time to configure the clock glitch filter. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_Trigger_Sample_Time***

42.1.4 LPTIM_InitTypeDef

LPTIM_InitTypeDef is defined in the stm32n6xx_hal_lptim.h

Data Fields

- ***LPTIM_ClockConfigTypeDef Clock***
- ***LPTIM_ULPClockConfigTypeDef UltraLowPowerClock***

- ***LPTIM_TriggerConfigTypeDef Trigger***
- ***uint32_t Period***
- ***uint32_t UpdateMode***
- ***uint32_t CounterSource***
- ***uint32_t Input1Source***
- ***uint32_t Input2Source***
- ***uint32_t RepetitionCounter***

Field Documentation

- ***LPTIM_ClockConfigTypeDef LPTIM_InitTypeDef::Clock***
  Specifies the clock parameters
- ***LPTIM_ULPClockConfigTypeDef LPTIM_InitTypeDef::UltraLowPowerClock***
  Specifies the Ultra Low Power clock parameters
- ***LPTIM_TriggerConfigTypeDef LPTIM_InitTypeDef::Trigger***
  Specifies the Trigger parameters
- ***uint32_t LPTIM_InitTypeDef::Period***
  Specifies the period value to be loaded into the active Auto-Reload Register at the next update event. This parameter can be a number between Min_Data = 0x0001 and Max_Data = 0xFFFF.
- ***uint32_t LPTIM_InitTypeDef::UpdateMode***
  Specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period. This parameter can be a value of ***LPTIM_Updating_Mode***
- ***uint32_t LPTIM_InitTypeDef::CounterSource***
  Specifies whether the counter is incremented each internal event or each external event. This parameter can be a value of ***LPTIM_Counter_Source***
- ***uint32_t LPTIM_InitTypeDef::Input1Source***
  Specifies source selected for input1 (GPIO or comparator output). This parameter can be a value of ***LPTIM_Input1_Source***
- ***uint32_t LPTIM_InitTypeDef::Input2Source***
  Specifies source selected for input2 (GPIO or comparator output). Note: This parameter is used only for encoder feature so is used only for LPTIM1 instance. This parameter can be a value of ***LPTIM_Input2_Source***
- ***uint32_t LPTIM_InitTypeDef::RepetitionCounter***
  Specifies the repetition counter value. Each time the RCR downcounter reaches zero, an update event is generated and counting restarts from the RCR value (N). Note: When using repetition counter the UpdateMode field must be set to LPTIM_UPDATE_ENDOFPERIOD otherwise unpredictable behavior may occur. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.

42.1.5 LPTIM_OC_ConfigTypeDef

LPTIM_OC_ConfigTypeDef is defined in the stm32n6xx_hal_lptim.h

Data Fields

- ***uint32_t Pulse***
- ***uint32_t OCPolarity***

Field Documentation

- ***uint32_t LPTIM_OC_ConfigTypeDef::Pulse***
  Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF
- ***uint32_t LPTIM_OC_ConfigTypeDef::OCPolarity***
  Specifies the output polarity. This parameter can be a value of ***LPTIM_Output_Compare_Polarity***

42.1.6 LPTIM_IC_ConfigTypeDef

LPTIM_IC_ConfigTypeDef is defined in the stm32n6xx_hal_lptim.h

Data Fields

- ***uint32_t ICInputSource***
- ***uint32_t ICPrescaler***
- ***uint32_t ICPolarity***

- ***uint32_t ICFilter***

Field Documentation

- ***uint32_t LPTIM_IC_ConfigTypeDef::ICInputSource***
  Specifies source selected for IC channel. This parameter can be a value of ***LPTIM_Input_Capture_Source***
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICPrescaler***
  Specifies the Input Capture Prescaler. This parameter can be a value of ***LPTIM_Input_Capture_Prescaler***
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICPolarity***
  Specifies the active edge of the input signal. This parameter can be a value of ***LPTIM_Input_Capture_Polarity***
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICFilter***
  Specifies the input capture filter. This parameter can be a value of ***LPTIM_Input_Capture_Filter***

42.1.7 __LPTIM_HandleTypeDef

__LPTIM_HandleTypeDef is defined in the stm32n6xx_hal_lptim.h

Data Fields

- ***LPTIM_TypeDef * Instance***
- ***LPTIM_InitTypeDef Init***
- ***HAL_LPTIM_ActiveChannel Channel***
- ***DMA_HandleTypeDef * hdma***
- ***HAL_StatusTypeDef Status***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_LPTIM_StateTypeDef State***
- ***__IO HAL_LPTIM_ChannelStateTypeDef ChannelState***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***void(* CompareMatchCallback***
- ***void(* AutoReloadMatchCallback***
- ***void(* TriggerCallback***
- ***void(* CompareWriteCallback***
- ***void(* AutoReloadWriteCallback***
- ***void(* DirectionUpCallback***
- ***void(* DirectionDownCallback***
- ***void(* UpdateEventCallback***
- ***void(* RepCounterWriteCallback***
- ***void(* UpdateEventHalfCpltCallback***
- ***void(* ErrorCallback***
- ***void(* IC_CaptureCallback***
- ***void(* IC_CaptureHalfCpltCallback***
- ***void(* IC_OverCaptureCallback***

Field Documentation

- ***LPTIM_TypeDef* __LPTIM_HandleTypeDef::Instance***
  Register base address
- ***LPTIM_InitTypeDef __LPTIM_HandleTypeDef::Init***
  LPTIM required parameters
- ***HAL_LPTIM_ActiveChannel __LPTIM_HandleTypeDef::Channel***
  Active channel
- ***DMA_HandleTypeDef* __LPTIM_HandleTypeDef::hdma[3]***
  DMA Handlers array, This array is accessed by a ***LPTIM_DMA_Handle_index***
- ***HAL_StatusTypeDef __LPTIM_HandleTypeDef::Status***
  LPTIM peripheral status

- ***HAL_LockTypeDef __LPTIM_HandleTypeDef::Lock***
  LPTIM locking object
- ***__IO HAL_LPTIM_StateTypeDef __LPTIM_HandleTypeDef::State***
  LPTIM peripheral state
- ***__IO HAL_LPTIM_ChannelStateTypeDef __LPTIM_HandleTypeDef::ChannelState[2]***
  LPTIM channel operation state
- ***void(* __LPTIM_HandleTypeDef::MspInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp Init Callback
- ***void(* __LPTIM_HandleTypeDef::MspDeInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp DeInit Callback
- ***void(* __LPTIM_HandleTypeDef::CompareMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare match Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload match Callback
- ***void(* __LPTIM_HandleTypeDef::TriggerCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  External trigger event detection Callback
- ***void(* __LPTIM_HandleTypeDef::CompareWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionUpCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Up-counting direction change Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionDownCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Down-counting direction change Callback
- ***void(* __LPTIM_HandleTypeDef::UpdateEventCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Update event detection Callback
- ***void(* __LPTIM_HandleTypeDef::RepCounterWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Repetition counter register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::UpdateEventHalfCpltCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Update event half complete detection Callback
- ***void(* __LPTIM_HandleTypeDef::ErrorCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Error Callback
- ***void(* __LPTIM_HandleTypeDef::IC_CaptureCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Input capture Callback
- ***void(* __LPTIM_HandleTypeDef::IC_CaptureHalfCpltCallback)(struct __LPTIM_HandleTypeDef *htim)***
  Input Capture half complete Callback
- ***void(* __LPTIM_HandleTypeDef::IC_OverCaptureCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Over capture Callback

42.2 LPTIM Firmware driver API description

The following section lists the various functions of the LPTIM library.

42.2.1 How to use this driver

The LPTIM HAL driver can be used as follows:

1. Initialize the LPTIM low level resources by implementing the HAL_LPTIM_MspInit():
   - Enable the LPTIM interface clock using __HAL_RCC_LPTIMx_CLK_ENABLE().
   - In case of using interrupts (e.g. HAL_LPTIM_PWM_Start_IT()):
     - Configure the LPTIM interrupt priority using HAL_NVIC_SetPriority().
     - Enable the LPTIM IRQ handler using HAL_NVIC_EnableIRQ().
     - In LPTIM IRQ handler, call HAL_LPTIM_IRQHandler().
2. Initialize the LPTIM HAL using HAL_LPTIM_Init(). This function configures mainly:
   - The instance: LPTIM1, LPTIM2, LPTIM3, LPTIM4 or LPTIM5.
   - Clock: the counter clock.
     - Source : it can be either the ULPTIM input (IN1) or one of the internal clock; (APB, LSE, LSI or MSI).
     - Prescaler: select the clock divider.
   - UltraLowPowerClock : To be used only if the ULPTIM is selected as counter clock source.
     - Polarity: polarity of the active edge for the counter unit if the ULPTIM input is selected.
     - SampleTime: clock sampling time to configure the clock glitch filter.
   - Trigger: How the counter start.
     - Source: trigger can be software or one of the hardware triggers.
     - ActiveEdge : only for hardware trigger.
     - SampleTime : trigger sampling time to configure the trigger glitch filter.
   - OutputPolarity : 2 opposite polarities are possible.
   - UpdateMode: specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period.
   - Input1Source: Source selected for input1 (GPIO or comparator output).
   - Input2Source: Source selected for input2 (GPIO or comparator output). Input2 is used only for encoder feature so is used only for LPTIM1 instance.
3. Six modes are available:
   - PWM Mode: To generate a PWM signal with specified period and pulse, call HAL_LPTIM_PWM_Start() or HAL_LPTIM_PWM_Start_IT() for interruption mode.
   - One Pulse Mode: To generate pulse with specified width in response to a stimulus, call HAL_LPTIM_OnePulse_Start() or HAL_LPTIM_OnePulse_Start_IT() for interruption mode.
   - Set once Mode: In this mode, the output changes the level (from low level to high level if the output polarity is configured high, else the opposite) when a compare match occurs. To start this mode, call HAL_LPTIM_SetOnce_Start() or HAL_LPTIM_SetOnce_Start_IT() for interruption mode.
   - Encoder Mode: To use the encoder interface call HAL_LPTIM_Encoder_Start() or HAL_LPTIM_Encoder_Start_IT() for interruption mode. Only available for LPTIM1 instance.
   - Time out Mode: an active edge on one selected trigger input rests the counter. The first trigger event will start the timer, any successive trigger event will reset the counter and the timer will restart. To start this mode call HAL_LPTIM_TimeOut_Start_IT() or HAL_LPTIM_TimeOut_Start_IT() for interruption mode.
   - Counter Mode: counter can be used to count external events on the LPTIM Input1 or it can be used to count internal clock cycles. To start this mode, call HAL_LPTIM_Counter_Start() or HAL_LPTIM_Counter_Start_IT() for interruption mode.
4. User can stop any process by calling the corresponding API: HAL_LPTIM_Xxx_Stop() or HAL_LPTIM_Xxx_Stop_IT() if the process is already started in interruption mode.
5. De-initialize the LPTIM peripheral using HAL_LPTIM_DeInit().

Callback registration

The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_LPTIM_RegisterCallback() to register a callback. HAL_LPTIM_RegisterCallback() takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_LPTIM_UnRegisterCallback() to reset a callback to the default weak function. HAL_LPTIM_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID.

These functions allow to register/unregister following callbacks:

- MspInitCallback : LPTIM Base Msp Init Callback.
- MspDeInitCallback : LPTIM Base Msp DeInit Callback.
- CompareMatchCallback : Compare match Callback.
- AutoReloadMatchCallback : Auto-reload match Callback.
- TriggerCallback : External trigger event detection Callback.
- CompareWriteCallback : Compare register write complete Callback.
- AutoReloadWriteCallback : Auto-reload register write complete Callback.
- DirectionUpCallback : Up-counting direction change Callback.
- DirectionDownCallback : Down-counting direction change Callback.
- UpdateEventCallback : Update event detection Callback.
- RepCounterWriteCallback : Repetition counter register write complete Callback.

By default, after the Init and when the state is HAL_LPTIM_STATE_RESET all interrupt callbacks are set to the corresponding weak functions: examples HAL_LPTIM_TriggerCallback(), HAL_LPTIM_CompareMatchCallback().

Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functionalities in the Init/DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the Init/DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand)

Callbacks can be registered/unregistered in HAL_LPTIM_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_LPTIM_STATE_READY or HAL_LPTIM_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_LPTIM_RegisterCallback() before calling DeInit or Init function.

When The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

42.2.2 Detailed description of functions

HAL_LPTIM_Init

Function name

HAL_StatusTypeDef HAL_LPTIM_Init (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_DeInit

Function name

HAL_StatusTypeDef HAL_LPTIM_DeInit (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_MspInit

Function name

void HAL_LPTIM_MspInit (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_MspDeInit

Function name

void HAL_LPTIM_MspDeInit (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_OC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_LPTIM_OC_ConfigChannel (LPTIM_HandleTypeDef * hlptim, const LPTIM_OC_ConfigTypeDef * sConfig, uint32_t Channel)

Function description

HAL_LPTIM_PWM_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_PWM_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_PWM_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_PWM_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_PWM_Start_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel, const uint32_t * pData, uint32_t Length)

Function description

HAL_LPTIM_PWM_Stop_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_OnePulse_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_OnePulse_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_OnePulse_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_OnePulse_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_SetOnce_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_SetOnce_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_SetOnce_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_SetOnce_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_Encoder_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_Encoder_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_Encoder_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start_IT (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_Encoder_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_TimeOut_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Timeout)

Function description

HAL_LPTIM_TimeOut_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_TimeOut_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Timeout)

Function description

HAL_LPTIM_TimeOut_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_Counter_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_Counter_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_Counter_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start_IT (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_Counter_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_IC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_ConfigChannel (LPTIM_HandleTypeDef * hlptim, const LPTIM_IC_ConfigTypeDef * sConfig, uint32_t Channel)

Function description

HAL_LPTIM_IC_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_IC_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_IC_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_IC_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_IC_Start_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel, uint32_t * pData, uint32_t Length)

Function description

HAL_LPTIM_IC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_ReadCounter

Function name

uint32_t HAL_LPTIM_ReadCounter (const LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_ReadAutoReload

Function name

uint32_t HAL_LPTIM_ReadAutoReload (const LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_ReadCapturedValue

Function name

uint32_t HAL_LPTIM_ReadCapturedValue (const LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_IC_GetOffset

Function name

uint8_t HAL_LPTIM_IC_GetOffset (const LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

HAL_LPTIM_IRQHandler

Function name

void HAL_LPTIM_IRQHandler (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_CompareMatchCallback

Function name

void HAL_LPTIM_CompareMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_AutoReloadMatchCallback

Function name

void HAL_LPTIM_AutoReloadMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_TriggerCallback

Function name

void HAL_LPTIM_TriggerCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_CompareWriteCallback

Function name

void HAL_LPTIM_CompareWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_AutoReloadWriteCallback

Function name

void HAL_LPTIM_AutoReloadWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_DirectionUpCallback

Function name

void HAL_LPTIM_DirectionUpCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_DirectionDownCallback

Function name

void HAL_LPTIM_DirectionDownCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_ErrorCallback

Function name

void HAL_LPTIM_ErrorCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_UpdateEventCallback

Function name

void HAL_LPTIM_UpdateEventCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_UpdateEventHalfCpltCallback

Function name

void HAL_LPTIM_UpdateEventHalfCpltCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_RepCounterWriteCallback

Function name

void HAL_LPTIM_RepCounterWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_IC_CaptureCallback

Function name

void HAL_LPTIM_IC_CaptureCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_IC_CaptureHalfCpltCallback

Function name

void HAL_LPTIM_IC_CaptureHalfCpltCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_IC_OverCaptureCallback

Function name

void HAL_LPTIM_IC_OverCaptureCallback (LPTIM_HandleTypeDef * hlptim)

Function description

HAL_LPTIM_RegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_RegisterCallback (LPTIM_HandleTypeDef * lphtim, HAL_LPTIM_CallbackIDTypeDef CallbackID, pLPTIM_CallbackTypeDef pCallback)

Function description

HAL_LPTIM_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_UnRegisterCallback (LPTIM_HandleTypeDef * lphtim, HAL_LPTIM_CallbackIDTypeDef CallbackID)

Function description

HAL_LPTIM_GetState

Function name

HAL_LPTIM_StateTypeDef HAL_LPTIM_GetState (const LPTIM_HandleTypeDef * hlptim)

Function description

42.3 LPTIM Firmware driver defines

The following section lists the various define and macros of the module.

42.3.1 LPTIM

LPTIM

LPTIM Channel

LPTIM_CHANNEL_1

Capture/compare channel 1 identifier

LPTIM_CHANNEL_2

Capture/compare channel 2 identifier

LPTIM Clock Polarity

LPTIM_CLOCKPOLARITY_RISING

LPTIM_CLOCKPOLARITY_FALLING

LPTIM_CLOCKPOLARITY_RISING_FALLING

LPTIM Clock Prescaler

LPTIM_PRESCALER_DIV1

LPTIM_PRESCALER_DIV2

LPTIM_PRESCALER_DIV4

LPTIM_PRESCALER_DIV8

LPTIM_PRESCALER_DIV16

LPTIM_PRESCALER_DIV32

LPTIM_PRESCALER_DIV64

LPTIM_PRESCALER_DIV128

LPTIM Clock Sample Time

LPTIM_CLOCKSAMPLETIME_DIRECTTRANSITION

LPTIM_CLOCKSAMPLETIME_2TRANSITIONS

LPTIM_CLOCKSAMPLETIME_4TRANSITIONS

LPTIM_CLOCKSAMPLETIME_8TRANSITIONS

LPTIM Clock Source

LPTIM_CLOCKSOURCE_APBCLOCK_LPOSC

LPTIM_CLOCKSOURCE_ULPTIM

LPTIM Counter Source

LPTIM_COUNTERSOURCE_INTERNAL

LPTIM_COUNTERSOURCE_EXTERNAL

LPTIM DMA Handle Index

LPTIM_DMA_ID_UPDATE

Index of the DMA handle used for Update DMA requests

LPTIM_DMA_ID_CC1

Index of the DMA handle used for Capture/Update event 1 DMA request

LPTIM_DMA_ID_CC2

Index of the DMA handle used for Capture/Update event 2 DMA request

LPTIM DMA Sources

LPTIM_DMA_UPDATE

DMA request is triggered by the update event

LPTIM_DMA_CC1

DMA request is triggered by the capture 1 event

LPTIM_DMA_CC2

DMA request is triggered by the capture 2 event

LPTIM Exported Macros

__HAL_LPTIM_RESET_HANDLE_STATE

Description:

- Reset LPTIM handle state.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_ENABLE

Description:

- Enable the LPTIM peripheral.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_DISABLE

Description:

- Disable the LPTIM peripheral.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_START_CONTINUOUS

Description:

- Start the LPTIM peripheral in Continuous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_START_SINGLE

Description:

- Start the LPTIM peripheral in single mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_RESET_COUNTER

Description:

- Reset the LPTIM Counter register in synchronous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_RESET_COUNTER_AFTERREAD

Description:

- Reset after read of the LPTIM Counter register in asynchronous mode.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- None

__HAL_LPTIM_AUTORELOAD_SET

Description:

- Write the passed parameter in the Autoreload register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Autoreload value

Return value:

- None

Notes:

- The ARR register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_COMPARE_SET

Description:

- Write the passed parameter in the Compare register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Compare value
- __CHANNEL__: TIM Channel to be configured

Return value:

- None

Notes:

- The CCRx registers can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_REPETITIONCOUNTER_SET

Description:

- Write the passed parameter in the Repetition register.

Parameters:

- __HANDLE__: LPTIM handle
- __VALUE__: Repetition value

Return value:

- None

__HAL_LPTIM_REPETITIONCOUNTER_GET

Description:

- Return the current Repetition value.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- Repetition: register value

Notes:

- The RCR register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_CAPTURE_COMPARE_ENABLE

Description:

- Enable the LPTIM signal input/output on the corresponding pin.

Parameters:

- __HANDLE__: LPTIM handle
- __CHANNEL__: LPTIM Channels to be enabled. This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return value:

- None

__HAL_LPTIM_CAPTURE_COMPARE_DISABLE

Description:

- Disable the LPTIM signal input/output on the corresponding pin.

Parameters:

- __HANDLE__: LPTIM handle
- __CHANNEL__: LPTIM Channels to be disabled. This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return value:

- None

__HAL_LPTIM_GET_FLAG

Description:

- Check whether the specified LPTIM flag is set or not.

Parameters:

- __HANDLE__: LPTIM handle
- __FLAG__: LPTIM flag to check This parameter can be a value of:
  - LPTIM_FLAG_REPOK : Repetition register update OK Flag.
  - LPTIM_FLAG_UPDATE : Update event Flag.
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMP1OK : Compare register 1 update OK Flag.
  - LPTIM_FLAG_CMP2OK : Compare register 2 update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CC1 : Capture/Compare 1 interrupt flag.
  - LPTIM_FLAG_CC2 : Capture/Compare 2 interrupt flag.
  - LPTIM_FLAG_CC1O : Capture/Compare 1 over-capture flag.
  - LPTIM_FLAG_CC2O : Capture/Compare 2 over-capture flag.
  - LPTIM_FLAG_DIEROK : DMA & interrupt enable update OK flag.

Return value:

- The: state of the specified flag (SET or RESET).

__HAL_LPTIM_CLEAR_FLAG

Description:

- Clear the specified LPTIM flag.

Parameters:

- __HANDLE__: LPTIM handle.
- __FLAG__: LPTIM flag to clear. This parameter can be a value of:
  - LPTIM_FLAG_REPOK : Repetition register update OK Flag.
  - LPTIM_FLAG_UPDATE : Update event Flag.
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMP1OK : Compare register 1 update OK Flag.
  - LPTIM_FLAG_CMP2OK : Compare register 2 update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CC1 : Capture/Compare 1 interrupt flag.
  - LPTIM_FLAG_CC2 : Capture/Compare 2 interrupt flag.
  - LPTIM_FLAG_CC1O : Capture/Compare 1 over-capture flag.
  - LPTIM_FLAG_CC2O : Capture/Compare 2 over-capture flag.
  - LPTIM_FLAG_DIEROK : DMA & interrupt enable update OK flag.

Return value:

- None.

__HAL_LPTIM_ENABLE_IT

Description:

- Enable the specified LPTIM interrupt.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:

- None.

Notes:

- The LPTIM interrupts can only be enabled when the LPTIM instance is enabled.

__HAL_LPTIM_DISABLE_IT

Description:

- Disable the specified LPTIM interrupt.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:

- None.

Notes:

- The LPTIM interrupts can only be disabled when the LPTIM instance is enabled.

__HAL_LPTIM_ENABLE_DMA

Description:

- Enable the specified DMA request.

Parameters:

- __HANDLE__: specifies the TIM Handle.
- __DMA__: specifies the LPTIM DMA request to enable. This parameter can be one of the following values:
  - LPTIM_DMA_UPDATE: Update DMA request
  - LPTIM_DMA_CC1: Capture/Compare 1 DMA request
  - LPTIM_DMA_CC2: Capture/Compare 2 DMA request

Return value:

- None

__HAL_LPTIM_DISABLE_DMA

Description:

- Disable the specified DMA request.

Parameters:

- __HANDLE__: specifies the LPTIM Handle.
- __DMA__: specifies the LPTIM DMA request to disable. This parameter can be one of the following values:
  - LPTIM_DMA_UPDATE: Update DMA request
  - LPTIM_DMA_CC1: Capture/Compare 1 DMA request
  - LPTIM_DMA_CC2: Capture/Compare 2 DMA request

Return value:

- None

__HAL_LPTIM_GET_IT_SOURCE

Description:

- Check whether the specified LPTIM interrupt source is enabled or not.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to check. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:

- Interrupt: status.

__HAL_LPTIM_LPTIM1_EXTI_ENABLE_IT

Description:

- Enable the LPTIM1 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM1_EXTI_DISABLE_IT

Description:

- Disable the LPTIM1 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM2_EXTI_ENABLE_IT

Description:

- Enable the LPTIM2 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM2_EXTI_DISABLE_IT

Description:

- Disable the LPTIM2 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM3_EXTI_ENABLE_IT

Description:

- Enable the LPTIM3 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM3_EXTI_DISABLE_IT

Description:

- Disable the LPTIM3 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM4_EXTI_ENABLE_IT

Description:

- Enable the LPTIM4 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM4_EXTI_DISABLE_IT

Description:

- Disable the LPTIM4 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM5_EXTI_ENABLE_IT

Description:

- Enable the LPTIM5 EXTI line in interrupt mode.

Return value:

- None

__HAL_LPTIM_LPTIM5_EXTI_DISABLE_IT

Description:

- Disable the LPTIM5 EXTI line in interrupt mode.

Return value:

- None

LPTIM Exported Types

LPTIM_EXTI_LINE_LPTIM1

External interrupt line 52 Connected to the LPTIM1 EXTI Line

LPTIM_EXTI_LINE_LPTIM2

External interrupt line 53 Connected to the LPTIM2 EXTI Line

LPTIM_EXTI_LINE_LPTIM3

External interrupt line 55 Connected to the LPTIM3 EXTI Line

LPTIM_EXTI_LINE_LPTIM4

External interrupt line 57 Connected to the LPTIM4 EXTI Line

LPTIM_EXTI_LINE_LPTIM5

External interrupt line 58 Connected to the LPTIM5 EXTI Line

LPTIM_INPUT1SOURCE_GPIO

For LPTIM1 and LPTIM2

LPTIM Input2 Source

LPTIM_INPUT2SOURCE_GPIO

For LPTIM1 and LPTIM2

LPTIM Input Capture Filter

LPTIM_ICFLT_CLOCK_DIV1

any external input capture signal level change is considered as a valid transition

LPTIM_ICFLT_CLOCK_DIV2

external input capture signal level change must be stable for at least 2 clock periods before it is considered as valid transition

LPTIM_ICFLT_CLOCK_DIV4

external input capture signal level change must be stable for at least 4 clock periods before it is considered as valid transition

LPTIM_ICFLT_CLOCK_DIV8

external input capture signal level change must be stable for at least 8 clock periods before it is considered as valid transition

LPTIM Input Capture Polarity

LPTIM_ICPOLARITY_RISING

Capture/Compare input rising polarity

LPTIM_ICPOLARITY_FALLING

Capture/Compare input falling polarity

LPTIM_ICPOLARITY_RISING_FALLING

Capture/Compare input rising and falling polarities

LPTIM Input Capture Prescaler

LPTIM_ICPSC_DIV1

Capture performed each time an edge is detected on the capture input

LPTIM_ICPSC_DIV2

Capture performed once every 2 events

LPTIM_ICPSC_DIV4

Capture performed once every 4 events

LPTIM_ICPSC_DIV8

Capture performed once every 8 events

LPTIM Input Capture Source

43 HAL LTDC Generic Driver

43.1 LTDC Firmware driver registers structures

43.1.1 LTDC_ColorTypeDef

LTDC_ColorTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint8_t Blue***
- ***uint8_t Green***
- ***uint8_t Red***
- ***uint8_t Reserved***

Field Documentation

- ***uint8_t LTDC_ColorTypeDef::Blue***
  Configures the blue value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Green***
  Configures the green value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Red***
  Configures the red value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Reserved***
  Reserved 0xFF

43.1.2 LTDC_InitTypeDef

LTDC_InitTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint32_t HSPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t DEPolarity***
- ***uint32_t PCPolarity***
- ***uint32_t HorizontalSync***
- ***uint32_t VerticalSync***
- ***uint32_t AccumulatedHBP***
- ***uint32_t AccumulatedVBP***
- ***uint32_t AccumulatedActiveW***
- ***uint32_t AccumulatedActiveH***
- ***uint32_t TotalWidth***
- ***uint32_t TotalHeigh***
- ***LTDC_ColorTypeDef Backcolor***

Field Documentation

- ***uint32_t LTDC_InitTypeDef::HSPolarity***
  configures the horizontal synchronization polarity. This parameter can be one value of ***LTDC_HS_POLARITY***
- ***uint32_t LTDC_InitTypeDef::VSPolarity***
  configures the vertical synchronization polarity. This parameter can be one value of ***LTDC_VS_POLARITY***
- ***uint32_t LTDC_InitTypeDef::DEPolarity***
  configures the data enable polarity. This parameter can be one of value of ***LTDC_DE_POLARITY***
- ***uint32_t LTDC_InitTypeDef::PCPolarity***
  configures the pixel clock polarity. This parameter can be one of value of ***LTDC_PC_POLARITY***

- ***uint32_t LTDC_InitTypeDef::HorizontalSync***
  configures the number of Horizontal synchronization width. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::VerticalSync***
  configures the number of Vertical synchronization height. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedHBP***
  configures the accumulated horizontal back porch width. This parameter must be a number between Min_Data = LTDC_HorizontalSync and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedVBP***
  configures the accumulated vertical back porch height. This parameter must be a number between Min_Data = LTDC_VerticalSync and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedActiveW***
  configures the accumulated active width. This parameter must be a number between Min_Data = LTDC_AccumulatedHBP and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedActiveH***
  configures the accumulated active height. This parameter must be a number between Min_Data = LTDC_AccumulatedVBP and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::TotalWidth***
  configures the total width. This parameter must be a number between Min_Data = LTDC_AccumulatedActiveW and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::TotalHeigh***
  configures the total height. This parameter must be a number between Min_Data = LTDC_AccumulatedActiveH and Max_Data = 0x7FF.
- ***LTDC_ColorTypeDef LTDC_InitTypeDef::Backcolor***
  Configures the background color.

43.1.3 LTDC_LayerCfgTypeDef

LTDC_LayerCfgTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint32_t WindowX0***
- ***uint32_t WindowX1***
- ***uint32_t WindowY0***
- ***uint32_t WindowY1***
- ***uint32_t PixelFormat***
- ***uint32_t Alpha***
- ***uint32_t Alpha0***
- ***uint32_t BlendingFactor1***
- ***uint32_t BlendingFactor2***
- ***uint32_t FBStartAdress***
- ***uint32_t ImageWidth***
- ***uint32_t ImageHeight***
- ***LTDC_ColorTypeDef Backcolor***

Field Documentation

- ***uint32_t LTDC_LayerCfgTypeDef::WindowX0***
  Configures the Window Horizontal Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_LayerCfgTypeDef::WindowX1***
  Configures the Window Horizontal Stop Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_LayerCfgTypeDef::WindowY0***
  Configures the Window vertical Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.

- ***uint32_t LTDC_LayerCfgTypeDef::WindowY1***
  Configures the Window vertical Stop Position. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_LayerCfgTypeDef::PixelFormat***
  Specifies the pixel format. This parameter can be one of value of ***LTDC_Pixelformat***
- ***uint32_t LTDC_LayerCfgTypeDef::Alpha***
  Specifies the constant alpha used for blending. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerCfgTypeDef::Alpha0***
  Configures the default alpha value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerCfgTypeDef::BlendingFactor1***
  Select the blending factor 1. This parameter can be one of value of ***LTDC_BlendingFactor1***
- ***uint32_t LTDC_LayerCfgTypeDef::BlendingFactor2***
  Select the blending factor 2. This parameter can be one of value of ***LTDC_BlendingFactor2***
- ***uint32_t LTDC_LayerCfgTypeDef::FBStartAdress***
  Configures the color frame buffer address
- ***uint32_t LTDC_LayerCfgTypeDef::ImageWidth***
  Configures the color frame buffer line length. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x1FFF.
- ***uint32_t LTDC_LayerCfgTypeDef::ImageHeight***
  Specifies the number of line in frame buffer. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***LTDC_ColorTypeDef LTDC_LayerCfgTypeDef::Backcolor***
  Configures the layer background color.

43.1.4 LTDC_LayerTypeDef

LTDC_LayerTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint32_t WindowX0***
- ***uint32_t WindowX1***
- ***uint32_t WindowY0***
- ***uint32_t WindowY1***
- ***uint32_t Alpha***
- ***uint32_t Alpha0***
- ***uint32_t BlendingFactor1***
- ***uint32_t BlendingFactor2***
- ***uint32_t ImageWidth***
- ***uint32_t ImageHeight***
- ***LTDC_ColorTypeDef Backcolor***

Field Documentation

- ***uint32_t LTDC_LayerTypeDef::WindowX0***
  Configures the Window Horizontal Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_LayerTypeDef::WindowX1***
  Configures the Window Horizontal Stop Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_LayerTypeDef::WindowY0***
  Configures the Window vertical Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_LayerTypeDef::WindowY1***
  Configures the Window vertical Stop Position. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x7FF.

- ***uint32_t LTDC_LayerTypeDef::Alpha***
  Specifies the constant alpha used for blending. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerTypeDef::Alpha0***
  Configures the default alpha value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerTypeDef::BlendingFactor1***
  Select the blending factor 1. This parameter can be one of value of ***LTDC_BlendingFactor1***
- ***uint32_t LTDC_LayerTypeDef::BlendingFactor2***
  Select the blending factor 2. This parameter can be one of value of ***LTDC_BlendingFactor2***
- ***uint32_t LTDC_LayerTypeDef::ImageWidth***
  Configures the color frame buffer line length. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x1FFF.
- ***uint32_t LTDC_LayerTypeDef::ImageHeight***
  Specifies the number of line in frame buffer. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***LTDC_ColorTypeDef LTDC_LayerTypeDef::Backcolor***
  Configures the layer background color.

43.1.5 LTDC_FlexARGBTypeDef

LTDC_FlexARGBTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint32_t PixelSize***
- ***uint32_t AlphaPos***
- ***uint32_t RedPos***
- ***uint32_t GreenPos***
- ***uint32_t BluePos***
- ***uint32_t AlphaWidth***
- ***uint32_t RedWidth***
- ***uint32_t GreenWidth***
- ***uint32_t BlueWidth***

Field Documentation

- ***uint32_t LTDC_FlexARGBTypeDef::PixelSize***
  Value of ARGB Pixel size. Could be a value of LTDC_ARGB_SIZE This parameter can be one of value of ***LTDC_ARGB_SIZE***
- ***uint32_t LTDC_FlexARGBTypeDef::AlphaPos***
  Position of the Alpha component inside the pixel memory word (in bits) This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x1F.
- ***uint32_t LTDC_FlexARGBTypeDef::RedPos***
  Position of the Red component inside the pixel memory word (in bits) This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x1F.
- ***uint32_t LTDC_FlexARGBTypeDef::GreenPos***
  Position of the Green component inside the pixel memory word (in bits) This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x1F.
- ***uint32_t LTDC_FlexARGBTypeDef::BluePos***
  Position of the Blue component inside the pixel memory word (in bits) This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xF.
- ***uint32_t LTDC_FlexARGBTypeDef::AlphaWidth***
  Width of the Alpha component in bits This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xF.
- ***uint32_t LTDC_FlexARGBTypeDef::RedWidth***
  Width of the Red component in bits This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xF.

- ***uint32_t LTDC_FlexARGBTypeDef::GreenWidth***
  Width of the Green component in bits This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xF.
- ***uint32_t LTDC_FlexARGBTypeDef::BlueWidth***
  Width of the Blue component in bits This parameter must be a number between Min_Data = 0x0 and Max_Data = 0xF.

43.1.6 LTDC_LayerFlexARGBTypeDef

LTDC_LayerFlexARGBTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***LTDC_LayerTypeDef Layer***
- ***LTDC_FlexARGBTypeDef FlexARGB***
- ***uint32_t ARGBAddress***

Field Documentation

- ***LTDC_LayerTypeDef LTDC_LayerFlexARGBTypeDef::Layer***
  Pointer to ***Section 43.3.1: LTDC_LayerTypeDef*** structure
- ***LTDC_FlexARGBTypeDef LTDC_LayerFlexARGBTypeDef::FlexARGB***
  Pointer to ***Section 43.3.1: LTDC_FlexARGBTypeDef*** structure
- ***uint32_t LTDC_LayerFlexARGBTypeDef::ARGBAddress***
  Configures the color frame buffer address

43.1.7 LTDC_FlexYUVTypeDef

LTDC_FlexYUVTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint32_t YUVOrder***
- ***uint32_t LuminanceOrder***
- ***uint32_t ChrominanceOrder***
- ***uint32_t LuminanceRescale***

Field Documentation

- ***uint32_t LTDC_FlexYUVTypeDef::YUVOrder***
  Y/UV order. This parameter can be one of value of ***LTDC_YUV_ORDER***
- ***uint32_t LTDC_FlexYUVTypeDef::LuminanceOrder***
  Y1/Y2 order. This parameter can be one of value of ***LTDC_LUMINANCE_ORDER***
- ***uint32_t LTDC_FlexYUVTypeDef::ChrominanceOrder***
  U/V order. This parameter can be one of value of ***LTDC_CHROMINANCE_ORDER***
- ***uint32_t LTDC_FlexYUVTypeDef::LuminanceRescale***
  Enable or disable luminance rescale. This parameter can be one of value of ***LTDC_LUMINANCE_RANGE***

43.1.8 LTDC_LayerFlexYUVCoPlanarTypeDef

LTDC_LayerFlexYUVCoPlanarTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***LTDC_LayerTypeDef Layer***
- ***LTDC_FlexYUVTypeDef FlexYUV***
- ***uint32_t YUVAddress***
- ***uint32_t ColorConverter***

Field Documentation

- ***LTDC_LayerTypeDef LTDC_LayerFlexYUVCoPlanarTypeDef::Layer***
  Pointer to ***Section 43.3.1: LTDC_LayerTypeDef*** structure
- ***LTDC_FlexYUVTypeDef LTDC_LayerFlexYUVCoPlanarTypeDef::FlexYUV***
  Pointer to ***Section 43.3.1: LTDC_FlexYUVTypeDef*** structure
- ***uint32_t LTDC_LayerFlexYUVCoPlanarTypeDef::YUVAddress***
  YUV Frame Buffer address

- ***uint32_t LTDC_LayerFlexYUVCoPlanarTypeDef::ColorConverter***
  Configure the YUV to RGB conversion. This parameter can be one of value of ***LTDC_YUV2RGBCONVERTOR***

43.1.9 LTDC_YUVSemiPlanarAddressTypeDef

LTDC_YUVSemiPlanarAddressTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint32_t YAddress***
- ***uint32_t UVAddress***

Field Documentation

- ***uint32_t LTDC_YUVSemiPlanarAddressTypeDef::YAddress***
  Y Frame Buffer address
- ***uint32_t LTDC_YUVSemiPlanarAddressTypeDef::UVAddress***
  UV Frame Buffer address

43.1.10 LTDC_YUVFullPlanarAddressTypeDef

LTDC_YUVFullPlanarAddressTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***uint32_t YAddress***
- ***uint32_t UAddress***
- ***uint32_t VAddress***

Field Documentation

- ***uint32_t LTDC_YUVFullPlanarAddressTypeDef::YAddress***
  Y Frame Buffer address
- ***uint32_t LTDC_YUVFullPlanarAddressTypeDef::UAddress***
  U Frame Buffer address
- ***uint32_t LTDC_YUVFullPlanarAddressTypeDef::VAddress***
  V Frame Buffer address

43.1.11 LTDC_LayerFlexYUVSemiPlanarTypeDef

LTDC_LayerFlexYUVSemiPlanarTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***LTDC_LayerTypeDef Layer***
- ***LTDC_FlexYUVTypeDef FlexYUV***
- ***LTDC_YUVSemiPlanarAddressTypeDef YUVSemiPlanarAddress***
- ***uint32_t ColorConverter***

Field Documentation

- ***LTDC_LayerTypeDef LTDC_LayerFlexYUVSemiPlanarTypeDef::Layer***
  Pointer to ***Section 43.3.1: LTDC_LayerTypeDef***
- ***LTDC_FlexYUVTypeDef LTDC_LayerFlexYUVSemiPlanarTypeDef::FlexYUV***
  Pointer ***Section 43.3.1: LTDC_FlexYUVTypeDef***
- ***LTDC_YUVSemiPlanarAddressTypeDef LTDC_LayerFlexYUVSemiPlanarTypeDef::YUVSemiPlanarAddress***
  Pointer ***Section 43.3.1: LTDC_YUVSemiPlanarAddressTypeDef***
- ***uint32_t LTDC_LayerFlexYUVSemiPlanarTypeDef::ColorConverter***
  Configure the YUV to RGB conversion. This parameter can be one of value of ***LTDC_YUV2RGBCONVERTOR***

43.1.12 LTDC_LayerFlexYUVFullPlanarTypeDef

LTDC_LayerFlexYUVFullPlanarTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***LTDC_LayerTypeDef Layer***

- ***LTDC_FlexYUVTypeDef FlexYUV***
- ***LTDC_YUVFullPlanarAddressTypeDef YUVFullPlanarAddress***
- ***uint32_t ColorConverter***

Field Documentation

- ***LTDC_LayerTypeDef LTDC_LayerFlexYUVFullPlanarTypeDef::Layer***
  Pointer to ***Section 43.3.1: LTDC_LayerTypeDef***
- ***LTDC_FlexYUVTypeDef LTDC_LayerFlexYUVFullPlanarTypeDef::FlexYUV***
  Pointer ***Section 43.3.1: LTDC_FlexYUVTypeDef***
- ***LTDC_YUVFullPlanarAddressTypeDef LTDC_LayerFlexYUVFullPlanarTypeDef::YUVFullPlanarAddress***
  Pointer ***Section 43.3.1: LTDC_YUVFullPlanarAddressTypeDef***
- ***uint32_t LTDC_LayerFlexYUVFullPlanarTypeDef::ColorConverter***
  Configure the YUV to RGB conversion. This parameter can be one of value of ***LTDC_YUV2RGBCONVERTOR***

43.1.13 __LTDC_HandleTypeDef

__LTDC_HandleTypeDef is defined in the stm32n6xx_hal_ltdc.h

Data Fields

- ***LTDC_TypeDef * Instance***
- ***LTDC_InitTypeDef Init***
- ***LTDC_LayerCfgTypeDef LayerCfg***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_LTDC_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* LineEventCallback***
- ***void(* ReloadEventCallback***
- ***void(* ErrorCallback***
- ***void(* WarningEventCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***LTDC_TypeDef* __LTDC_HandleTypeDef::Instance***
  LTDC Register base address
- ***LTDC_InitTypeDef __LTDC_HandleTypeDef::Init***
  LTDC parameters
- ***LTDC_LayerCfgTypeDef __LTDC_HandleTypeDef::LayerCfg[MAX_LAYER]***
  LTDC Layers parameters
- ***HAL_LockTypeDef __LTDC_HandleTypeDef::Lock***
  LTDC Lock
- ***__IO HAL_LTDC_StateTypeDef __LTDC_HandleTypeDef::State***
  LTDC state
- ***__IO uint32_t __LTDC_HandleTypeDef::ErrorCode***
  LTDC Error code
- ***void(* __LTDC_HandleTypeDef::LineEventCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Line Event Callback
- ***void(* __LTDC_HandleTypeDef::ReloadEventCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Reload Event Callback
- ***void(* __LTDC_HandleTypeDef::ErrorCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Error Callback
- ***void(* __LTDC_HandleTypeDef::WarningEventCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Warning Event
- ***void(* __LTDC_HandleTypeDef::MspInitCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Msp Init callback

- ***void(* __LTDC_HandleTypeDef::MspDeInitCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Msp DeInit callback

43.2 LTDC Firmware driver API description

The following section lists the various functions of the LTDC library.

43.2.1 How to use this driver

The LTDC HAL driver can be used as follows:

1. Declare a LTDC_HandleTypeDef handle structure, for example: LTDC_HandleTypeDef hltdc;
2. Initialize the LTDC low level resources by implementing the HAL_LTDC_MspInit() API:
   a. Enable the LTDC interface clock
   b. NVIC configuration if you need to use interrupt process
      - Configure the LTDC interrupt priority
      - Enable the NVIC LTDC IRQ Channel
3. Initialize the required configuration through the following parameters: the LTDC timing, the horizontal and vertical polarity, the pixel clock polarity, Data Enable polarity and the LTDC background color value using HAL_LTDC_Init() function

Configuration

1. Program the required configuration through the following parameters: the pixel format, the blending factors, input alpha value, the window size and the image size using HAL_LTDC_ConfigLayer() function for foreground or/and background layer.
2. Optionally, configure and enable the CLUT using HAL_LTDC_ConfigCLUT() and HAL_LTDC_EnableCLUT functions.
3. Optionally, enable the Dither using HAL_LTDC_EnableDither().
4. Optionally, configure and enable the Color keying using HAL_LTDC_ConfigColorKeying() and HAL_LTDC_EnableColorKeying functions.
5. Optionally, configure LineInterrupt using HAL_LTDC_ProgramLineEvent() function
6. If needed, reconfigure and change the pixel format value, the alpha value value, the window size, the window position and the layer start address for foreground or/and background layer using respectively the following functions: HAL_LTDC_SetPixelFormat(), HAL_LTDC_SetAlpha(), HAL_LTDC_SetWindowSize(), HAL_LTDC_SetWindowPosition() and HAL_LTDC_SetAddress().
7. Variant functions with _NoReload suffix allows to set the LTDC configuration/settings without immediate reload. This is useful in case when the program requires to modify serval LTDC settings (on one or both layers) then applying(reload) these settings in one shot by calling the function HAL_LTDC_Reload(). After calling the _NoReload functions to set different color/format/layer settings, the program shall call the function HAL_LTDC_Reload() to apply(reload) these settings. Function HAL_LTDC_Reload() can be called with the parameter ReloadType set to LTDC_RELOAD_IMMEDIATE if an immediate reload is required. Function HAL_LTDC_Reload() can be called with the parameter ReloadType set to LTDC_RELOAD_VERTICAL_BLANKING if the reload should be done in the next vertical blanking period, this option allows to avoid display flicker by applying the new settings during the vertical blanking period.
8. To control LTDC state you can use the following function: HAL_LTDC_GetState()

LTDC HAL driver macros list

Below the list of most used macros in LTDC HAL driver.

- __HAL_LTDC_ENABLE: Enable the LTDC.
- __HAL_LTDC_DISABLE: Disable the LTDC.
- __HAL_LTDC_LAYER_ENABLE: Enable an LTDC Layer.
- __HAL_LTDC_LAYER_DISABLE: Disable an LTDC Layer.
- __HAL_LTDC_RELOAD_IMMEDIATE_CONFIG: Reload Layer Configuration.
- __HAL_LTDC_GET_FLAG: Get the LTDC pending flags.
- __HAL_LTDC_CLEAR_FLAG: Clear the LTDC pending flags.
- __HAL_LTDC_ENABLE_IT: Enable the specified LTDC interrupts.

- __HAL_LTDC_DISABLE_IT: Disable the specified LTDC interrupts.
- __HAL_LTDC_GET_IT_SOURCE: Check whether the specified LTDC interrupt has occurred or not.

Note: You can refer to the LTDC HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_LTDC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_LTDC_RegisterCallback() to register a callback.

Function HAL_LTDC_RegisterCallback() allows to register following callbacks:

- LineEventCallback : LTDC Line Event Callback.
- ReloadEventCallback : LTDC Reload Event Callback.
- ErrorCallback : LTDC Error Callback
- MspInitCallback : LTDC MspInit.
- MspDeInitCallback : LTDC MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_LTDC_UnRegisterCallback() to reset a callback to the default weak function. HAL_LTDC_UnRegisterCallback() takes as parameters the HAL peripheral handle and the callback ID.

This function allows to reset following callbacks:

- LineEventCallback : LTDC Line Event Callback
- ReloadEventCallback : LTDC Reload Event Callback
- ErrorCallback : LTDC Error Callback
- MspInitCallback : LTDC MspInit
- MspDeInitCallback : LTDC MspDeInit.

By default, after the HAL_LTDC_Init and when the state is HAL_LTDC_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_LTDC_LineEventCallback(), HAL_LTDC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak (surcharged) functions in the HAL_LTDC_Init() and HAL_LTDC_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_LTDC_Init() and HAL_LTDC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_LTDC_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_LTDC_STATE_READY or HAL_LTDC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_LTDC_RegisterCallback() before calling HAL_LTDC_DeInit() or HAL_LTDC_Init() function.

When the compilation define USE_HAL_LTDC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

43.2.2 Detailed description of functions

HAL_LTDC_Init

Function name

HAL_StatusTypeDef HAL_LTDC_Init (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_DeInit

Function name

HAL_StatusTypeDef HAL_LTDC_DeInit (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_MspInit

Function name

void HAL_LTDC_MspInit (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_MspDeInit

Function name

void HAL_LTDC_MspDeInit (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_ErrorCallback

Function name

void HAL_LTDC_ErrorCallback (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_LineEventCallback

Function name

void HAL_LTDC_LineEventCallback (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_ReloadEventCallback

Function name

void HAL_LTDC_ReloadEventCallback (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_WarningEventCallback

Function name

void HAL_LTDC_WarningEventCallback (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_ConfigBurstLength

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigBurstLength (LTDC_HandleTypeDef * hltdc, uint32_t BurstLength, uint32_t LayerIdx)

Function description

HAL_LTDC_ConfigUnderrunThreshold

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigUnderrunThreshold (LTDC_HandleTypeDef * hltdc, uint16_t Threshold)

Function description

HAL_LTDC_ConfigMirror

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigMirror (LTDC_HandleTypeDef * hltdc, uint32_t Mirror, uint32_t LayerIdx)

Function description

HAL_LTDC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_LTDC_RegisterCallback (LTDC_HandleTypeDef * hltdc, HAL_LTDC_CallbackIDTypeDef CallbackID, pLTDC_CallbackTypeDef pCallback)

Function description

HAL_LTDC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_LTDC_UnRegisterCallback (LTDC_HandleTypeDef * hltdc, HAL_LTDC_CallbackIDTypeDef CallbackID)

Function description

HAL_LTDC_IRQHandler

Function name

void HAL_LTDC_IRQHandler (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_ConfigLayer

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayer (LTDC_HandleTypeDef * hltdc, LTDC_LayerCfgTypeDef * pLayerCfg, uint32_t LayerIdx)

Function description

HAL_LTDC_ConfigLayerFlexARGB

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayerFlexARGB (LTDC_HandleTypeDef * hltdc, const LTDC_LayerFlexARGBTypeDef * pLayerFlexARGB, uint32_t LayerIdx)

Function description

HAL_LTDC_ConfigLayerFlexYUVSemiPlanar

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayerFlexYUVSemiPlanar (LTDC_HandleTypeDef * hltdc, LTDC_LayerFlexYUVSemiPlanarTypeDef * pLayerFlexYUVSemiPlanar, uint32_t LayerIdx)

Function description

HAL_LTDC_ConfigLayerFlexYUVFullPlanar

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayerFlexYUVFullPlanar (LTDC_HandleTypeDef * hltdc, LTDC_LayerFlexYUVFullPlanarTypeDef * pLayerFlexYUVFullPlanar, uint32_t LayerIdx)

Function description

HAL_LTDC_ConfigCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigCLUT (LTDC_HandleTypeDef * hltdc, const uint32_t * pCLUT, uint32_t CLUTSize, uint32_t LayerIdx)

Function description

HAL_LTDC_EnableColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_EnableColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_DisableColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_DisableColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_ConfigBlendingOrder

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigBlendingOrder (LTDC_HandleTypeDef * hltdc, uint32_t Order, uint32_t LayerIdx)

Function description

HAL_LTDC_EnableDefaultColor

Function name

HAL_StatusTypeDef HAL_LTDC_EnableDefaultColor (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_DisableDefaultColor

Function name

HAL_StatusTypeDef HAL_LTDC_DisableDefaultColor (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_EnableGammaCorrection

Function name

HAL_StatusTypeDef HAL_LTDC_EnableGammaCorrection (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_DisableGammaCorrection

Function name

HAL_StatusTypeDef HAL_LTDC_DisableGammaCorrection (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_ConfigGammaCorrection

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigGammaCorrection (LTDC_HandleTypeDef * hltdc, uint32_t GammaOnes, uint32_t GammaTenths, uint32_t RGBComponent)

Function description

HAL_LTDC_EnableCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_EnableCLUT (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_DisableCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_DisableCLUT (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_ProgramLineEvent

Function name

HAL_StatusTypeDef HAL_LTDC_ProgramLineEvent (LTDC_HandleTypeDef * hltdc, uint32_t Line)

Function description

HAL_LTDC_EnableDither

Function name

HAL_StatusTypeDef HAL_LTDC_EnableDither (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_DisableDither

Function name

HAL_StatusTypeDef HAL_LTDC_DisableDither (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_Reload

Function name

HAL_StatusTypeDef HAL_LTDC_Reload (LTDC_HandleTypeDef * hltdc, uint32_t ReloadType)

Function description

HAL_LTDC_ReloadLayer

Function name

HAL_StatusTypeDef HAL_LTDC_ReloadLayer (LTDC_HandleTypeDef * hltdc, uint32_t ReloadType, uint32_t LayerIdx)

Function description

HAL_LTDC_SetOutputDisplay

Function name

HAL_StatusTypeDef HAL_LTDC_SetOutputDisplay (LTDC_HandleTypeDef * hltdc, uint32_t Display)

Function description

HAL_LTDC_SetExpectedCRC

Function name

HAL_StatusTypeDef HAL_LTDC_SetExpectedCRC (LTDC_HandleTypeDef * hltdc, uint16_t ExpectedCRC)

Function description

HAL_LTDC_EnableCRC

Function name

HAL_StatusTypeDef HAL_LTDC_EnableCRC (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_DisableCRC

Function name

HAL_StatusTypeDef HAL_LTDC_DisableCRC (LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_GetComputedCRC

Function name

HAL_StatusTypeDef HAL_LTDC_GetComputedCRC (LTDC_HandleTypeDef * hltdc, uint16_t * pComputedCRC)

Function description

HAL_LTDC_ConfigLayer_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayer_NoReload (LTDC_HandleTypeDef * hltdc, LTDC_LayerCfgTypeDef * pLayerCfg, uint32_t LayerIdx)

Function description

HAL_LTDC_SetWindowSize_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowSize_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t XSize, uint32_t YSize, uint32_t LayerIdx)

Function description

HAL_LTDC_SetWindowPosition_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowPosition_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t X0, uint32_t Y0, uint32_t LayerIdx)

Function description

HAL_LTDC_SetPixelFormat_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetPixelFormat_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Pixelformat, uint32_t LayerIdx)

Function description

HAL_LTDC_SetAlpha_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetAlpha_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Alpha, uint32_t LayerIdx)

Function description

HAL_LTDC_SetAddress_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetAddress_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Address, uint32_t LayerIdx)

Function description

HAL_LTDC_SetPitch_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetPitch_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LinePitchInPixels, uint32_t LayerIdx)

Function description

HAL_LTDC_EnableColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_EnableColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_DisableColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_DisableColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_EnableCLUT_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_EnableCLUT_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

HAL_LTDC_DisableCLUT_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_DisableCLUT_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

HAL_LTDC_GetState

Function name

HAL_LTDC_StateTypeDef HAL_LTDC_GetState (const LTDC_HandleTypeDef * hltdc)

Function description

HAL_LTDC_GetError

Function name

uint32_t HAL_LTDC_GetError (const LTDC_HandleTypeDef * hltdc)

Function description

43.3 LTDC Firmware driver defines

The following section lists the various define and macros of the module.

43.3.1 LTDC

LTDC

LTDC Alpha

LTDC_ALPHA

LTDC Constant Alpha mask

LTDC ARGB pixel size in bytes

LTDC_ARGB_PIXEL_SIZE_1_BYTE

Custom ARGB with 1 byte per pixel

LTDC_ARGB_PIXEL_SIZE_2_BYTES

Custom ARGB with 2 bytes per pixel

LTDC_ARGB_PIXEL_SIZE_3_BYTES

Custom ARGB with 3 bytes per pixel

LTDC_ARGB_PIXEL_SIZE_4_BYTES

Custom ARGB with 4 bytes per pixel

LTDC BACK COLOR

LTDC_COLOR

Color mask

LTDC Blending Factor1

LTDC_BLENDING_FACTOR1_CA

Blending factor : Cte Alpha

LTDC_BLENDING_FACTOR1_PAxCA

Blending factor : Cte Alpha x Pixel Alpha

LTDC Blending Factor2

LTDC_BLENDING_FACTOR2_CA

Blending factor : Cte Alpha

LTDC_BLENDING_FACTOR2_PAxCA

Blending factor : Cte Alpha x Pixel Alpha

LTDC layers blending order

LTDC_BLENDING_ORDER_FOREGROUND

Layer set to Foreground during blending

LTDC_BLENDING_ORDER_BACKGROUND

Layer set to Background during blending

LTDC chrominance order from LSB

LTDC_YUV_CHROMIANCE_ORDER_U_FIRST

Chrominance order U first

LTDC_YUV_CHROMIANCE_ORDER_V_FIRST

Chrominance order V first

LTDC DE POLARITY

LTDC_DEPOLARITY_AL

Data Enable, is active low.

LTDC_DEPOLARITY_AH

Data Enable, is active high.

LTDC Display

LTDC_OUT_RGB

Select RGB as output format (default)

LTDC_OUT_YUV_HDTV

RGB converted to YUV using ITU-R BT.709

LTDC_OUT_YUV_SDTV

RGB converted to YUV using ITU-R BT.601

LTDC_OUT_YVU_HDTV

RGB converted to YVU using ITU-R BT.709

LTDC_OUT_YVU_SDTV

RGB converted to YVU using ITU-R BT.601

LTDC Error Code

HAL_LTDC_ERROR_NONE

LTDC No error

HAL_LTDC_ERROR_TE

LTDC Transfer error

HAL_LTDC_ERROR_FU

LTDC FIFO Underrun

HAL_LTDC_ERROR_CRC

LTDC CRC error

HAL_LTDC_ERROR_TIMEOUT

LTDC Timeout error

HAL_LTDC_ERROR_INVALID_CALLBACK

LTDC Invalid Callback error

LTDC Exported Macros

__HAL_LTDC_RESET_HANDLE_STATE

Description:

- Reset LTDC handle state.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None

__HAL_LTDC_ENABLE

Description:

- Enable the LTDC.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_DISABLE

Description:

- Disable the LTDC.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_LAYER_ENABLE

Description:

- Enable the LTDC Layer.

Parameters:

- __HANDLE__: LTDC handle
- __LAYER__: Specify the layer to be enabled. This parameter can be LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return value:

- None.

__HAL_LTDC_LAYER_DISABLE

Description:

- Disable the LTDC Layer.

Parameters:

- __HANDLE__: LTDC handle
- __LAYER__: Specify the layer to be disabled. This parameter can be LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return value:

- None.

__HAL_LTDC_RELOAD_IMMEDIATE_CONFIG

Description:

- Reload immediately all LTDC Layers.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_VERTICAL_BLANKING_RELOAD_CONFIG

Description:

- Reload during vertical blanking period all LTDC Layers.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_GET_FLAG

Description:

- Get the LTDC pending flags.

Parameters:

- __HANDLE__: LTDC handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - LTDC_FLAG_LI: Line Interrupt flag
  - LTDC_FLAG_FU: FIFO Underrun Interrupt flag
  - LTDC_FLAG_TE: Transfer Error interrupt flag
  - LTDC_FLAG_RR: Register Reload Interrupt Flag
  - LTDC_FLAG_CRC: LTDC CRC error interrupt flag
  - LTDC_FLAG_FUW: FIFO Warning Underrun interrupt flag

Return value:

- The: state of FLAG (SET or RESET).

__HAL_LTDC_CLEAR_FLAG

Description:

- Clears the LTDC pending flags.

Parameters:

- __HANDLE__: LTDC handle
- __FLAG__: Specify the flag to clear. This parameter can be any combination of the following values:
  - LTDC_FLAG_LI: Line Interrupt flag
  - LTDC_FLAG_FU: FIFO Underrun Interrupt flag
  - LTDC_FLAG_TE: Transfer Error interrupt flag
  - LTDC_FLAG_RR: Register Reload Interrupt Flag
  - LTDC_FLAG_CRC: LTDC CRC error Interrupt flag
  - LTDC_FLAG_FUW: FIFO Warning Underrun Interrupt flag

Return value:

- None

__HAL_LTDC_ENABLE_IT

Description:

- Enables the specified LTDC interrupts.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt sources to be enabled. This parameter can be any combination of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag
  - LTDC_IT_CRC: LTDC CRC error Interrupt
  - LTDC_IT_FUW: FIFO Warning Underrun Interrupt

Return value:

- None

__HAL_LTDC_DISABLE_IT

Description:

- Disables the specified LTDC interrupts.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt sources to be disabled. This parameter can be any combination of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag
  - LTDC_IT_CRC: LTDC CRC error Interrupt
  - LTDC_IT_FUW: FIFO Underrun Warning Interrupt

Return value:

- None

__HAL_LTDC_GET_IT_SOURCE

Description:

- Check whether the specified LTDC interrupt has occurred or not.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt source to check. This parameter can be one of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag
  - LTDC_IT_CRC: LTDC CRC error Interrupt
  - LTDC_IT_FUW: FIFO Underrun Warning Interrupt

Return value:

- The: state of INTERRUPT (SET or RESET).

LTDC Exported Types

MAX_LAYER

LTDC Flags

LTDC_FLAG_LI

LTDC Line Interrupt Flag

LTDC_FLAG_FU

LTDC FIFO Underrun interrupt Flag

LTDC_FLAG_TE

LTDC Transfer Error interrupt Flag

LTDC_FLAG_RR

LTDC Register Reload interrupt Flag

LTDC_FLAG_CRC

LTDC CRC error Interrupt

LTDC_FLAG_FUW

LTDC FIFO Warning Underrun Interrupt

LTDC HS POLARITY

LTDC_HSPOLARITY_AL

Horizontal Synchronization is active low.

LTDC_HSPOLARITY_AH

Horizontal Synchronization is active high.

LTDC Interrupts

LTDC_IT_LI

LTDC Line Interrupt

LTDC_IT_FU

LTDC FIFO Underrun Interrupt

LTDC_IT_TE

LTDC Transfer Error Interrupt

LTDC_IT_RR

LTDC Register Reload Interrupt

LTDC_IT_CRC

LTDC CRC error Interrupt

LTDC_IT_FUW

LTDC FIFO Warning Underrun Interrupt

LTDC Layer

LTDC_LAYER_1

LTDC Layer 1

LTDC_LAYER_2

LTDC Layer 2

LTDC LAYER Config

LTDC_STOPPOSITION

LTDC Layer stop position

LTDC_STARTPOSITION

LTDC Layer start position

LTDC_COLOR_FRAME_BUFFER

LTDC Layer Line length

LTDC_LINE_NUMBER

LTDC Layer Line number

LTDC luminance order from LSB

LTDC_YUV_LUMINANCE_ORDER_ODD_FIRST

Lumiance order Y1 then Y2

LTDC_YUV_LUMINANCE_ORDER_EVEN_FIRST

Luminance order Y2 then Y1

LTDC luminance range

LTDC_YUV_LUMINANCE_RESCALE_ENABLE

Rescale Luminance from [16-235] to [0-255]

LTDC_YUV_LUMINANCE_RESCALE_DISABLE

Luminance provided in range [0-255]

LTDC Mirror Configuration

LTDC_MIRROR_HORIZONTAL

Enable Horizontal Mirroring

LTDC_MIRROR_VERTICAL

Enable Vertical Mirroring

LTDC_MIRROR_HORIZONTAL_VERTICAL

Enable Horizontal and vertical Mirroring

LTDC_MIRROR_NONE

Disable Horizontal and vertical Mirroring

LTDC PC POLARITY

LTDC_PCPOLARITY_IPC

input pixel clock.

LTDC_PCPOLARITY_IIPC

inverted input pixel clock.

LTDC Pixel format

LTDC_PIXEL_FORMAT_ARGB8888

ARGB8888 LTDC pixel format

LTDC_PIXEL_FORMAT_ABGR8888

ABGR888 LTDC pixel format

LTDC_PIXEL_FORMAT_RGBA8888

RGBA888 LTDC pixel format

LTDC_PIXEL_FORMAT_BGRA8888

BGRA8888 LTDC pixel format

LTDC_PIXEL_FORMAT_RGB565

RGB565 LTDC pixel format

LTDC_PIXEL_FORMAT_BGR565

BGR565 LTDC pixel format

LTDC_PIXEL_FORMAT_RGB888

RGB888 LTDC pixel format

LTDC_PIXEL_FORMAT_ARGB1555

ARGB1555 LTDC pixel format

LTDC_PIXEL_FORMAT_ARGB4444

ARGB4444 LTDC pixel format

LTDC_PIXEL_FORMAT_L8

L8 LTDC pixel format

LTDC_PIXEL_FORMAT_AL44

AL44 LTDC pixel format

LTDC_PIXEL_FORMAT_AL88

AL88 LTDC pixel format

LTDC Reload Type

LTDC_RELOAD_IMMEDIATE

Immediate Reload

LTDC_RELOAD_VERTICAL_BLANKING

Vertical Blanking Reload

LTDC RGB component

LTDC_RGB_COMPONENT_RED

Red component

LTDC_RGB_COMPONENT_GREEN

Green component

LTDC_RGB_COMPONENT_BLUE

Blue component

LTDC_RGB_COMPONENT_ALL

Red, Blue and Green components

LTDC SYNC

LTDC_HORIZONTALSYNC

Horizontal synchronization width.

LTDC_VERTICALSYNC

Vertical synchronization height.

LTDC VS POLARITY

LTDC_VSPOLARITY_AL

Vertical Synchronization is active low.

LTDC_VSPOLARITY_AH

Vertical Synchronization is active high.

LTDC YUV to RGB color convertor

LTDC_YUV2RGBCONVERTOR_BT601_REDUCED_RANGE

Select ITU-R BT.601 as output format

LTDC_YUV2RGBCONVERTOR_BT709_REDUCED_RANGE

Select ITU-R BT.709 as output format

LTDC_YUV2RGBCONVERTOR_BT601_FULL_RANGE

Select RGB as output format

LTDC_YUV2RGBCONVERTOR_BT709_FULL_RANGE

Select RGB as output format

LTDC YUV order from LSB

LTDC_YUV_ORDER_LUMINANCE_FIRST

Luminance component first

LTDC_YUV_ORDER_CHROMINANCE_FIRST

Chrominance component (U or V) first

44 HAL MCE Generic Driver

44.1 MCE Firmware driver registers structures

44.1.1 MCE_RegionConfigTypeDef

MCE_RegionConfigTypeDef is defined in the stm32n6xx_hal_mce.h

Data Fields

- ***uint32_t ContextID***
- ***uint32_t StartAddress***
- ***uint32_t EndAddress***

Field Documentation

- ***uint32_t MCE_RegionConfigTypeDef::ContextID***
  MCE region context ID (can be null) This parameter is a value of ***MCE_Context_Index***.
- ***uint32_t MCE_RegionConfigTypeDef::StartAddress***
  MCE region start address
- ***uint32_t MCE_RegionConfigTypeDef::EndAddress***
  MCE region end address

44.1.2 MCE_AESConfigTypeDef

MCE_AESConfigTypeDef is defined in the stm32n6xx_hal_mce.h

Data Fields

- ***uint32_t Nonce***
- ***uint32_t Version***
- ***uint32_t * pKey***
- ***uint32_t KeySize***
- ***uint32_t Cipher_Mode***

Field Documentation

- ***uint32_t MCE_AESConfigTypeDef::Nonce[2]***
  MCE context nonce
- ***uint32_t MCE_AESConfigTypeDef::Version***
  16-bit long MCE context version
- ***uint32_t* MCE_AESConfigTypeDef::pKey***
  Pointer at the key used for encryption/decryption
- ***uint32_t MCE_AESConfigTypeDef::KeySize***
  This parameter can be MCE_AES_128 or MCE_AES_256
- ***uint32_t MCE_AESConfigTypeDef::Cipher_Mode***
  Authorized cipher mode

44.1.3 MCE_NoekeonConfigTypeDef

MCE_NoekeonConfigTypeDef is defined in the stm32n6xx_hal_mce.h

Data Fields

- ***uint32_t KeyType***
- ***uint32_t * pKey***

Field Documentation

- ***uint32_t MCE_NoekeonConfigTypeDef::KeyType***
  This parameter is a value of ***MCE_KeyType***.
- ***uint32_t* MCE_NoekeonConfigTypeDef::pKey***
  Pointer at the key used for encryption/decryption .

44.1.4 __MCE_HandleTypeDef

__MCE_HandleTypeDef is defined in the stm32n6xx_hal_mce.h

Data Fields

- ***MCE_TypeDef * Instance***
- ***HAL_MCE_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***MCE_TypeDef* __MCE_HandleTypeDef::Instance***
  MCE registers base address
- ***HAL_MCE_StateTypeDef __MCE_HandleTypeDef::State***
  MCE state
- ***HAL_LockTypeDef __MCE_HandleTypeDef::Lock***
  MCE Locking object
- ***__IO uint32_t __MCE_HandleTypeDef::ErrorCode***
  MCE error code
- ***void(* __MCE_HandleTypeDef::ErrorCallback)(struct __MCE_HandleTypeDef *hmce)***
  MCE error callback
- ***void(* __MCE_HandleTypeDef::MspInitCallback)(struct __MCE_HandleTypeDef *hmce)***
  MCE Msp Init callback
- ***void(* __MCE_HandleTypeDef::MspDeInitCallback)(struct __MCE_HandleTypeDef *hmce)***
  MCE Msp DeInit callback

44.2 MCE Firmware driver defines

The following section lists the various define and macros of the module.

44.2.1 MCE

MCE

MCE Ciphering Algorithm

MCE_NO_CIPHER

MCE no cipher

MCE_STREAM_CIPHER

MCE stream cipher

MCE_BLOCK_CIPHER

MCE block cipher

MCE_FASTBLOCK_CIPHER

MCE fast block cipher

MCE Cipher Selection

MCE_AES_128

AES-128 cipher selected for all encrypted regions

MCE_AES_256

AES-256 cipher selected for all encrypted regions

MCE_NOEKEON

Noekeon cipher selected for all encrypted regions

MCE Configuration Attributes

MCE_ATTRIBUTE_NPRIV

Non-privileged access protection

MCE_ATTRIBUTE_PRIV

Privileged access protection

MCE Context Mode

MCE_CONTEXT_STREAM_CIPHER

Stream cipher is allowed with this cipher context

MCE_CONTEXT_BLOCK_CIPHER

Block cipher is allowed with this cipher context

MCE_CONTEXT_FASTBLOCK_CIPHER

Fast block cipher is allowed with this cipher context

MCE Context Index

MCE_NO_CONTEXT

MCE no context

MCE_CONTEXT1

MCE context 1

MCE_CONTEXT2

MCE context 2

MCE Error Definition

HAL_MCE_ERROR_NONE

No error

HAL_MCE_CONFIGURATION_ACCESS_ERROR

Configuration access error

HAL_MCE_ILLEGAL_ACCESS_READ_PRIV_ERROR

Illegal privileged data read or instruction fetch access error

HAL_MCE_ILLEGAL_ACCESS_READ_NPRIV_ERROR

Illegal unprivileged data read or instruction fetch access error

HAL_MCE_ILLEGAL_ACCESS_WRITE_PRIV_ERROR

Illegal privileged data write access error

HAL_MCE_ILLEGAL_ACCESS_WRITE_NPRIV_ERROR

Illegal un privileged data write access error

HAL_MCE_MASTER_KEY_ERROR

Master key error

HAL_MCE_FASTMASTER_KEY_ERROR

Fast master key error

HAL_MCE_CONTEXT_KEY_ERROR

Context key error

HAL_MCE_ERROR_INVALID_CALLBACK

Invalid Callback error

MCE Exported Macros

__HAL_MCE_RESET_HANDLE_STATE

Description:

- Reset MCE handle state.

Parameters:

- __HANDLE__: pointer to an MCE_HandleTypeDef structure that contains the configuration information for MCE module

Return value:

- None

__HAL_MCE_ENABLE_IT

Description:

- Enable MCE peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an MCE_HandleTypeDef structure that contains the configuration information for MCE module
- __INTERRUPT__: mask on enabled interrupts This parameter can be one of the following values:
  - MCE_IT_ILLEGAL_ACCESS_ERROR MCE illegal access error interrupt

Return value:

- None

__HAL_MCE_DISABLE_IT

Description:

- Disable MCE peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an MCE_HandleTypeDef structure that contains the configuration information for MCE module
- __INTERRUPT__: mask on disabled interrupts This parameter can be one of the following values:
  - MCE_IT_ILLEGAL_ACCESS_ERROR MCE illegal access error interrupt

Return value:

- None

__HAL_MCE_GET_FLAG

Description:

- Get MCE peripheral access error flag.

Parameters:

- __HANDLE__: pointer to an MCE_HandleTypeDef structure that contains the configuration information for MCE module
- __FLAG__: access error flag to check This parameter can be one of the following values:
  - MCE_ILLEGAL_ACCESS_READ_NPRIV MCE illegal access error flag

Return value:

- 0: (not set) or 1 (set)

__HAL_MCE_CLEAR_FLAG

Description:

- Clear MCE peripheral illegal/configuration access flag.

Parameters:

- __HANDLE__: pointer to an MCE_HandleTypeDef structure that contains the configuration information for MCE module
- __FLAG__: illegal access flag to check This parameter can be one of the following values:
  - MCE_ILLEGAL_ACCESS_READ_NPRIV MCE illegal access error flag

Return value:

- 0: (not set) or 1 (set)

MCE Illegal Access Flags

MCE_ILLEGAL_ACCESS_READ_NPRIV

Illegal unprivileged data read/instruction fetch access flag

MCE Interrupts

MCE_IT_ILLEGAL_ACCESS_ERROR

Illegal access error interrupt

key type used for encryption, Master key or Fast Master key

MCE_USE_MASTERKEYS

Master keys used for encryption

MCE_USE_FASTMASTERKEYS

Fast Master keys used for encryption

MCE Lock values

MCE_LOCK_OFF

No global lock set

MCE_LOCK_ON

Global lock set

MCE_MASTERKEYS_LOCK_OFF

No master keys lock set

MCE_MASTERKEYS_LOCK_ON

Master keys lock set

MCE Regions Index

MCE_REGION1

MCE region 1

MCE_REGION2

MCE region 2

MCE_REGION3

MCE region 3

MCE_REGION4

MCE region 4

MCE Region Privilege

MCE_REGION_READONLY

Writes to region are ignored, reads are allowed

MCE_REGION_READWRITE

Region can be read and written

45 HAL MDF Generic Driver

45.1 MDF Firmware driver registers structures

45.1.1 MDF_ClockTriggerTypeDef

MDF_ClockTriggerTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Source***
- ***uint32_t Edge***

Field Documentation

- ***FunctionalState MDF_ClockTriggerTypeDef::Activation***
  Output clock trigger enable/disable
- ***uint32_t MDF_ClockTriggerTypeDef::Source***
  Output clock trigger source. This parameter can be a value of ***MDF_ClockTriggerSource***
- ***uint32_t MDF_ClockTriggerTypeDef::Edge***
  Output clock trigger edge. This parameter can be a value of ***MDF_ClockTriggerEdge***

45.1.2 MDF_OutputClockTypeDef

MDF_OutputClockTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Pins***
- ***uint32_t Divider***
- ***MDF_ClockTriggerTypeDef Trigger***

Field Documentation

- ***FunctionalState MDF_OutputClockTypeDef::Activation***
  Output clock enable/disable
- ***uint32_t MDF_OutputClockTypeDef::Pins***
  Output clock pins. This parameter can be a value of ***MDF_OuputClockPins***
- ***uint32_t MDF_OutputClockTypeDef::Divider***
  Output clock divider. This parameter must be a number between Min_Data = 1 and Max_Data = 16
- ***MDF_ClockTriggerTypeDef MDF_OutputClockTypeDef::Trigger***
  Output clock trigger parameters

45.1.3 MDF_CommonParamTypeDef

MDF_CommonParamTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***uint32_t InterleavedFilters***
- ***uint32_t ProcClockDivider***
- ***MDF_OutputClockTypeDef OutputClock***

Field Documentation

- ***uint32_t MDF_CommonParamTypeDef::InterleavedFilters***
  Number of filters in interleaved mode with filter 0. This parameter must be a number between Min_Data = 0 and Max_Data = 5.
  Note:
  – This parameter is not used for ADF instance
- ***uint32_t MDF_CommonParamTypeDef::ProcClockDivider***
  Processing clock divider. This parameter must be a number between Min_Data = 1 and Max_Data = 128

- ***MDF_OutputClockTypeDef MDF_CommonParamTypeDef::OutputClock***
  Output clock parameters

45.1.4 MDF_SerialInterfaceTypeDef

MDF_SerialInterfaceTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Mode***
- ***uint32_t ClockSource***
- ***uint32_t Threshold***

Field Documentation

- ***FunctionalState MDF_SerialInterfaceTypeDef::Activation***
  Serial interface enable/disable
- ***uint32_t MDF_SerialInterfaceTypeDef::Mode***
  Serial interface mode. This parameter can be a value of ***MDF_SitfMode***
- ***uint32_t MDF_SerialInterfaceTypeDef::ClockSource***
  Serial interface clock source. This parameter can be a value of ***MDF_SitfClockSource***
- ***uint32_t MDF_SerialInterfaceTypeDef::Threshold***
  SPI threshold for clock absence detection or Manchester symbol threshold. This parameter must be a number between Min_Data = 4 and Max_Data = 31

45.1.5 MDF_InitTypeDef

MDF_InitTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***MDF_CommonParamTypeDef CommonParam***
- ***MDF_SerialInterfaceTypeDef SerialInterface***
- ***uint32_t FilterBistream***

Field Documentation

- ***MDF_CommonParamTypeDef MDF_InitTypeDef::CommonParam***
  MDF common parameters
- ***MDF_SerialInterfaceTypeDef MDF_InitTypeDef::SerialInterface***
  MDF serial interface parameters
- ***uint32_t MDF_InitTypeDef::FilterBistream***
  MDF filter bitstream selection. This parameter can be a value of ***MDF_FilterBitstream***

45.1.6 __MDF_HandleTypeDef

__MDF_HandleTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***MDF_Filter_TypeDef * Instance***
- ***MDF_InitTypeDef Init***
- ***DMA_HandleTypeDef * hdma***
- ***__IO HAL_MDF_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* OldCallback***
- ***void(* AcqCpltCallback***
- ***void(* AcqHalfCpltCallback***
- ***void(* SndLvCallback***
- ***void(* SadCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***MDF_Filter_TypeDef* __MDF_HandleTypeDef::Instance***
  MDF instance
- ***MDF_InitTypeDef __MDF_HandleTypeDef::Init***
  MDF init parameters
- ***DMA_HandleTypeDef* __MDF_HandleTypeDef::hdma***
  Pointer on DMA handler for acquisitions
- ***__IO HAL_MDF_StateTypeDef __MDF_HandleTypeDef::State***
  MDF state
- ***__IO uint32_t __MDF_HandleTypeDef::ErrorCode***
  MDF error code
- ***void(* __MDF_HandleTypeDef::OldCallback)(struct __MDF_HandleTypeDef *hmdf, uint32_t Threshold)***
  MDF out-off limit detector callback.
  Note:
  – Not used for ADF instance
- ***void(* __MDF_HandleTypeDef::AcqCpltCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF acquisition complete callback
- ***void(* __MDF_HandleTypeDef::AcqHalfCpltCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF acquisition half complete callback
- ***void(* __MDF_HandleTypeDef::SndLvCallback)(struct __MDF_HandleTypeDef *hmdf, uint32_t SoundLevel, uint32_t AmbientNoise)***
  MDF sound level callback.
  Note:
  – Not used for MDF instance
- ***void(* __MDF_HandleTypeDef::SadCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF sound activity detector callback.
  Note:
  – Not used for MDF instance
- ***void(* __MDF_HandleTypeDef::ErrorCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF error callback
- ***void(* __MDF_HandleTypeDef::MspInitCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF MSP init callback
- ***void(* __MDF_HandleTypeDef::MspDeInitCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF MSP de-init callback

45.1.7 MDF_ReshapeFilterTypeDef

MDF_ReshapeFilterTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t DecimationRatio***

Field Documentation

- ***FunctionalState MDF_ReshapeFilterTypeDef::Activation***
  Reshape filter enable/disable
- ***uint32_t MDF_ReshapeFilterTypeDef::DecimationRatio***
  Reshape filter decimation ratio. This parameter can be a value of ***MDF_ReshapeDecimationRatio***

45.1.8 MDF_HighPassFilterTypeDef

MDF_HighPassFilterTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t CutOffFrequency***

Field Documentation

- ***FunctionalState MDF_HighPassFilterTypeDef::Activation***
  High pass filter enable/disable

- ***uint32_t MDF_HighPassFilterTypeDef::CutOffFrequency***
  High pass filter cut-off frequency. This parameter can be a value of ***MDF_HighPassCutOffFreq***

45.1.9 MDF_IntegratorTypeDef

MDF_IntegratorTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Value***
- ***uint32_t OutputDivision***

Field Documentation

- ***FunctionalState MDF_IntegratorTypeDef::Activation***
  Integrator enable/disable
- ***uint32_t MDF_IntegratorTypeDef::Value***
  Integrator value. This parameter must be a number between Min_Data = 2 and Max_Data = 128
- ***uint32_t MDF_IntegratorTypeDef::OutputDivision***
  Integrator output division. This parameter can be a value of ***MDF_IntegratorOutputDiv***

45.1.10 MDF_SoundActivityTypeDef

MDF_SoundActivityTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Mode***
- ***uint32_t FrameSize***
- ***FunctionalState Hysteresis***
- ***uint32_t SoundTriggerEvent***
- ***uint32_t DataMemoryTransfer***
- ***uint32_t MinNoiseLevel***
- ***uint32_t HangoverWindow***
- ***uint32_t LearningFrames***
- ***uint32_t AmbientNoiseSlope***
- ***uint32_t SignalNoiseThreshold***
- ***FunctionalState SoundLevelInterrupt***

Field Documentation

- ***FunctionalState MDF_SoundActivityTypeDef::Activation***
  Sound activity detector enable/disable
- ***uint32_t MDF_SoundActivityTypeDef::Mode***
  Sound activity detector mode. This parameter can be a value of ***MDF_SadMode***
- ***uint32_t MDF_SoundActivityTypeDef::FrameSize***
  Size of one frame to compute short-term signal level. This parameter can be a value of ***MDF_SadFrameSize***
- ***FunctionalState MDF_SoundActivityTypeDef::Hysteresis***
  Hysteresis enable/disable.
  Note:
  – This parameter is not used if Mode is set to MDF_SAD_AMBIENT_NOISE_ESTIMATOR
- ***uint32_t MDF_SoundActivityTypeDef::SoundTriggerEvent***
  Sound trigger event configuration. This parameter can be a value of ***MDF_SadSoundTriggerEvent***
- ***uint32_t MDF_SoundActivityTypeDef::DataMemoryTransfer***
  Data memory transfer mode. This parameter can be a value of ***MDF_SadDataMemoryTransfer***
- ***uint32_t MDF_SoundActivityTypeDef::MinNoiseLevel***
  Minimum noise level. This parameter must be a number between Min_Data = 0 and Max_Data = 8191
- ***uint32_t MDF_SoundActivityTypeDef::HangoverWindow***
  Hangover time window in frames. This parameter can be a value of ***MDF_SadHangoverWindow***

- ***uint32_t MDF_SoundActivityTypeDef::LearningFrames***
  Number of learning frames for the first estimation of noise level. This parameter can be a value of ***MDF_SadLearningFrames***
- ***uint32_t MDF_SoundActivityTypeDef::AmbientNoiseSlope***
  Ambient noise slope control. This parameter must be a number between Min_Data = 0 and Max_Data = 7.
  Note:
  – This parameter is not used if Mode is set to MDF_SAD_SOUND_DETECTOR
- ***uint32_t MDF_SoundActivityTypeDef::SignalNoiseThreshold***
  Signal to noise threshold. This parameter can be a value of ***MDF_SadSignalNoiseThreshold***
- ***FunctionalState MDF_SoundActivityTypeDef::SoundLevelInterrupt***
  Sound level interrupt enable/disable.
  Note:
  – This interrupt is mainly used for debug purpose

45.1.11 MDF_FilterTriggerTypeDef

MDF_FilterTriggerTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Edge***

Field Documentation

- ***uint32_t MDF_FilterTriggerTypeDef::Source***
  Filter trigger source. This parameter can be a value of ***MDF_FilterTriggerSource***
- ***uint32_t MDF_FilterTriggerTypeDef::Edge***
  Filter trigger edge. This parameter can be a value of ***MDF_FilterTriggerEdge***

45.1.12 MDF_FilterConfigTypeDef

MDF_FilterConfigTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***uint32_t DataSource***
- ***uint32_t Delay***
- ***uint32_t CicMode***
- ***uint32_t DecimationRatio***
- ***int32_t Offset***
- ***int32_t Gain***
- ***MDF_ReshapeFilterTypeDef ReshapeFilter***
- ***MDF_HighPassFilterTypeDef HighPassFilter***
- ***MDF_IntegratorTypeDef Integrator***
- ***MDF_SoundActivityTypeDef SoundActivity***
- ***uint32_t AcquisitionMode***
- ***uint32_t FifoThreshold***
- ***uint32_t DiscardSamples***
- ***MDF_FilterTriggerTypeDef Trigger***
- ***uint32_t SnapshotFormat***

Field Documentation

- ***uint32_t MDF_FilterConfigTypeDef::DataSource***
  Filter data source. This parameter can be a value of ***MDF_DataSource***
- ***uint32_t MDF_FilterConfigTypeDef::Delay***
  Delay to apply on data source in number of samples. This parameter must be a number between Min_Data = 0 and Max_Data = 127
- ***uint32_t MDF_FilterConfigTypeDef::CicMode***
  CIC filter mode. This parameter can be a value of ***MDF_CicMode***

- ***uint32_t MDF_FilterConfigTypeDef::DecimationRatio***
  Filter decimation ratio. This parameter must be a number between Min_Data = 2 and Max_Data = 512
- ***int32_t MDF_FilterConfigTypeDef::Offset***
  Filter offset error compensation. This parameter must be a number between Min_Data = -33554432 and Max_Data = 33554431.
  Note:
  – This parameter is not used for ADF instance
- ***int32_t MDF_FilterConfigTypeDef::Gain***
  Filter gain in step of around 3db (from -48db to 72dB). This parameter must be a number between Min_Data = -16 and Max_Data = 24
- ***MDF_ReshapeFilterTypeDef MDF_FilterConfigTypeDef::ReshapeFilter***
  Reshape filter configuration
- ***MDF_HighPassFilterTypeDef MDF_FilterConfigTypeDef::HighPassFilter***
  High pass filter configuration
- ***MDF_IntegratorTypeDef MDF_FilterConfigTypeDef::Integrator***
  Integrator configuration.
  Note:
  – This parameter is not used for ADF instance
- ***MDF_SoundActivityTypeDef MDF_FilterConfigTypeDef::SoundActivity***
  Sound activity detector configuration.
  Note:
  – This parameter is not used for MDF instance
- ***uint32_t MDF_FilterConfigTypeDef::AcquisitionMode***
  Filter acquisition mode. This parameter can be a value of ***MDF_AcquisitionMode***
- ***uint32_t MDF_FilterConfigTypeDef::FifoThreshold***
  Filter RXFIFO threshold. This parameter can be a value of ***MDF_FifoThreshold***
- ***uint32_t MDF_FilterConfigTypeDef::DiscardSamples***
  Number of samples to discard after filter enable. This parameter must be a number between Min_Data = 0 and Max_Data = 255
- ***MDF_FilterTriggerTypeDef MDF_FilterConfigTypeDef::Trigger***
  Filter trigger configuration.
  Note:
  – This parameter is not used if AcquisitionMode is set to MDF_MODE_ASYNC_CONT or MDF_MODE_ASYNC_SINGLE
- ***uint32_t MDF_FilterConfigTypeDef::SnapshotFormat***
  Snapshot format. This parameter can be a value of ***MDF_SnapshotFormat***.
  Note:
  – This parameter is used only if AcquisitionMode is set to MDF_MODE_SYNC_SNAPSHOT and for MDF instance

45.1.13 MDF_SnapshotParamTypeDef

MDF_SnapshotParamTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***int32_t Value***
- ***uint32_t DecimationCounter***
- ***uint32_t IntegratorCounter***

Field Documentation

- ***int32_t MDF_SnapshotParamTypeDef::Value***
  Snapshot acquisition value on 16 or 23 MSB depending on snapshot format
- ***uint32_t MDF_SnapshotParamTypeDef::DecimationCounter***
  Decimation counter value when snapshot trigger occurs
- ***uint32_t MDF_SnapshotParamTypeDef::IntegratorCounter***
  Integrator counter value when snapshot trigger occurs. This value is available only if snapshot format is 16 bits resolution

45.1.14 MDF_DmaConfigTypeDef

MDF_DmaConfigTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***uint32_t Address***
- ***uint32_t DataLength***
- ***FunctionalState MsbOnly***

Field Documentation

- ***uint32_t MDF_DmaConfigTypeDef::Address***
  DMA destination address
- ***uint32_t MDF_DmaConfigTypeDef::DataLength***
  Length of data to transfer in bytes
- ***FunctionalState MDF_DmaConfigTypeDef::MsbOnly***
  Transfer only the 16MSB of the acquistion data

45.1.15 MDF_ScdConfigTypeDef

MDF_ScdConfigTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***uint32_t Threshold***
- ***uint32_t BreakSignal***

Field Documentation

- ***uint32_t MDF_ScdConfigTypeDef::Threshold***
  Short-circuit detector threshold. This parameter must be a number between Min_Data = 2 and Max_Data = 256
- ***uint32_t MDF_ScdConfigTypeDef::BreakSignal***
  Break signal assignment for short-circuit detector. This parameter can be a values combination of ***MDF_BreakSignals***

45.1.16 MDF_OldConfigTypeDef

MDF_OldConfigTypeDef is defined in the stm32n6xx_hal_mdf.h

Data Fields

- ***uint32_t OldCicMode***
- ***uint32_t OldDecimationRatio***
- ***int32_t HighThreshold***
- ***int32_t LowThreshold***
- ***uint32_t OldEventConfig***
- ***uint32_t BreakSignal***

Field Documentation

- ***uint32_t MDF_OldConfigTypeDef::OldCicMode***
  Out-off limit detector CIC filter mode. This parameter can be a value of ***MDF_OldCicMode***
- ***uint32_t MDF_OldConfigTypeDef::OldDecimationRatio***
  Out-off limit detector decimation ratio. This parameter must be a number between Min_Data = 1 and Max_Data = 32
- ***int32_t MDF_OldConfigTypeDef::HighThreshold***
  Out-off limit detector high threshold. This parameter must be a number between Min_Data = -33554432 and Max_Data = 33554431
- ***int32_t MDF_OldConfigTypeDef::LowThreshold***
  Out-off limit detector low threshold. This parameter must be a number between Min_Data = -33554432 and Max_Data = 33554431
- ***uint32_t MDF_OldConfigTypeDef::OldEventConfig***
  Out-off limit event configuration. This parameter can be a value of ***MDF_OldEventConfig***
- ***uint32_t MDF_OldConfigTypeDef::BreakSignal***
  Break signal assignment for out-off limit detector. This parameter can be a values combination of ***MDF_BreakSignals***

45.2 MDF Firmware driver API description

The following section lists the various functions of the MDF library.

45.2.1 How to use this driver

Initialization and de-initialization

1. User has first to initialize MDF or ADF instance.
2. As prerequisite, fill in the HAL_MDF_MspInit() :
   – Enable MDFz or ADFz clock interface with __HAL_RCC_MDFz_CLK_ENABLE() or __HAL_RCC_ADFz_CLK_ENABLE().
   – Enable the clocks for the used GPIOS with __HAL_RCC_GPIOx_CLK_ENABLE().
   – Configure these pins in alternate mode using HAL_GPIO_Init().
   – If interrupt mode is used, enable and configure MDFz_FLTx or ADFz interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
   – If DMA mode is used, initialize and configure DMA.
3. Configure the common parameters (only for first MDF or ADF instance init), serial interface parameters and filter bitstream selection by calling HAL_MDF_Init() function.
1. User can de-initialize MDF or ADF instance with HAL_MDF_DeInit() function.

Acquisition

1. Configure filter parameters and start acquisition using HAL_MDF_AcqStart(), HAL_MDF_AcqStart_IT() or HAL_MDF_AcqStart_DMA().
2. In polling mode :
   – Use HAL_MDF_PollForAcq() to detect the end of acquisition. Use HAL_MDF_GetAcqValue to get acquisition value.
   – Only for MDF instance, use HAL_MDF_PollForSnapshotAcq() to detect the end of snapshot acquisition. Use HAL_MDF_GetSnapshotAcqValue to get snapshot acquisition value.
   – Only for ADF instance, use HAL_MDF_PollForSndLvl() to detect and get new sound level value and ambient noise value.
   – Only for ADF instance, use HAL_MDF_PollForSad() to detect sound activity.
3. In interrupt mode :
   – HAL_MDF_AcqCpltCallback() will be called at the end of acquisition. Use HAL_MDF_GetAcqValue to get acquisition value or use HAL_MDF_GetSnapshotAcqValue to get snapshot acquisition value.
   – Only for ADF instance, HAL_MDF_SndLvlCallback() will be called when new sound level and ambient noise values are available.
   – Only for ADF instance, HAL_MDF_SadCallback() will be called when sound activity detection occurs.
   – HAL_MDF_ErrorCallback() will be called if overflow, filter overrun or saturation occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
4. In DMA mode :
   – HAL_MDF_AcqHalfCpltCallback() and HAL_MDF_AcqCpltCallback() will be called respectively at the half acquisition and at the acquisition complete.
   – Only for ADF instance, HAL_MDF_SndLvlCallback() will be called when new sound level and ambient noise values are available.
   – Only for ADF instance, HAL_MDF_SadCallback() will be called when sound activity detection occurs.
   – HAL_MDF_ErrorCallback() will be called if overflow, filter overrun, saturation or DMA error occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
5. Use HAL_MDF_GenerateTrgo() to generate pulse on TRGO signal.
6. During acquisition, use HAL_MDF_SetDelay() and HAL_MDF_GetDelay() to respectively set and get the delay on data source.
7. During acquisition, use HAL_MDF_SetGain() and HAL_MDF_GetGain() to respectively set and get the filter gain.

8. During acquisition, use HAL_MDF_SetOffset() and HAL_MDF_GetOffset() to respectively set and get the filter offset error compensation.
9. During acquisition, only for MDF instance, use HAL_MDF_SetOffset() and HAL_MDF_GetOffset() to respectively set and get the filter offset error compensation.
10. Stop acquisition using HAL_MDF_AcqStop(), HAL_MDF_AcqStop_IT() or HAL_MDF_AcqStop_DMA().

Clock absence detection

1. Clock absence detection is always enabled so no need to start clock absence detection in polling mode. Use HAL_MDF_CkabStart_IT() to start clock absence detection in interrupt mode.
2. In polling mode, use HAL_MDF_PollForCkab() to detect the clock absence.
3. In interrupt mode, HAL_MDF_ErrorCallback() will be called if clock absence detection occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
4. Stop clock absence detection in interrupt mode using HAL_MDF_CkabStop_IT().

Short circuit detection

1. Only for MDF instance, start short circuit detection using HAL_MDF_ScdStart() or HAL_MDF_ScdStart_IT().
2. In polling mode, use HAL_MDF_PollForScd() to detect short circuit.
3. In interrupt mode, HAL_MDF_ErrorCallback() will be called if short circuit detection occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
4. Stop short circuit detection using HAL_MDF_ScdStop() or HAL_MDF_ScdStop_IT().

Out-off limit detection

1. Only for MDF instance, start out-off limit detection using HAL_MDF_OldStart() or HAL_MDF_OldStart_IT().
2. In polling mode, use HAL_MDF_PollForOld() to detect out-off limit and to get threshold information.
3. In interrupt mode, HAL_MDF_OldCallback() will be called if out-off limit detection occurs.
4. Stop out-off limit detection using HAL_MDF_OldStop() or HAL_MDF_OldStop_IT().

generic functions

1. HAL_MDF_IRQHandler will be called when MDF or ADF interrupt occurs.
2. HAL_MDF_ErrorCallback will be called when MDF or ADF error occurs.
3. Use HAL_MDF_GetState() to get the current MDF or ADF instance state.
4. Use HAL_MDF_GetErrorCode() to get the current MDF or ADF instance error code.

Callback registration

The compilation define USE_HAL_MDF_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_MDF_RegisterCallback(), HAL_MDF_RegisterOldCallback() or HAL_MDF_RegisterSndLvlCallback() to register a user callback.

Function HAL_MDF_RegisterCallback() allows to register following callbacks :

- AcqCpltCallback : Acquisition complete callback.
- AcqHalfCpltCallback : Acquisition half complete callback.
- SadCallback : Sound activity detection callback (only for ADF instance).
- ErrorCallback : Error callback.
- MspInitCallback : MSP init callback.
- MspDeInitCallback : MSP de-init callback.

This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For MDF instance and for specific out-off limit detection callback use dedicated register callback : HAL_MDF_RegisterOldCallback().

For ADF instance and for specific sound level callback use dedicated register callback : HAL_MDF_RegisterSndLvlCallback().

Use function HAL_MDF_UnRegisterCallback() to reset a callback to the default weak function.

HAL_MDF_UnRegisterCallback() takes as parameters the HAL peripheral handle and the Callback ID.

This function allows to reset following callbacks :

- AcqCpltCallback : Acquisition complete callback.
- AcqHalfCpltCallback : Acquisition half complete callback.
- SadCallback : Sound activity detection callback (only for ADF instance).
- ErrorCallback : Error callback.
- MspInitCallback : MSP init callback.
- MspDeInitCallback : MSP de-init callback.

For MDF instance and for specific out-off limit detection callback use dedicated unregister callback : HAL_MDF_UnRegisterOldCallback().

For ADF instance and for specific sound level callback use dedicated unregister callback : HAL_MDF_UnRegisterSndLvlCallback().

By default, after the call of init function and if the state is RESET all callbacks are reset to the corresponding legacy weak functions : examples HAL_MDF_AcqCpltCallback(), HAL_MDF_ErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the init and de-init only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the init and de-init keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the init/de-init. In that case first register the MspInit/MspDeInit user callbacks using HAL_MDF_RegisterCallback() before calling init or de-init function.

When the compilation define USE_HAL_MDF_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

45.2.2 Detailed description of functions

HAL_MDF_Init

Function name

HAL_StatusTypeDef HAL_MDF_Init (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_DeInit

Function name

HAL_StatusTypeDef HAL_MDF_DeInit (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_MspInit

Function name

void HAL_MDF_MspInit (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_MspDeInit

Function name

void HAL_MDF_MspDeInit (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MDF_RegisterCallback (MDF_HandleTypeDef * hmdf, HAL_MDF_CallbackIDTypeDef CallbackID, pMDF_CallbackTypeDef pCallback)

Function description

HAL_MDF_UnRegisterCallback

HAL_MDF_RegisterSndLvlCallback

Function name

HAL_StatusTypeDef HAL_MDF_RegisterSndLvlCallback (MDF_HandleTypeDef * hmdf, pMDF_SndLvlCallbackTypeDef pCallback)

Function description

HAL_MDF_UnRegisterSndLvlCallback

Function name

HAL_StatusTypeDef HAL_MDF_UnRegisterSndLvlCallback (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_AcqStart

Function name

HAL_StatusTypeDef HAL_MDF_AcqStart (MDF_HandleTypeDef * hmdf, const MDF_FilterConfigTypeDef * pFilterConfig)

Function description

HAL_MDF_PollForAcq

Function name

HAL_StatusTypeDef HAL_MDF_PollForAcq (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

HAL_MDF_PollForSnapshotAcq

Function name

HAL_StatusTypeDef HAL_MDF_PollForSnapshotAcq (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

HAL_MDF_GetAcqValue

Function name

HAL_StatusTypeDef HAL_MDF_GetAcqValue (const MDF_HandleTypeDef * hmdf, int32_t * pValue)

Function description

HAL_MDF_GetSnapshotAcqValue

Function name

HAL_StatusTypeDef HAL_MDF_GetSnapshotAcqValue (MDF_HandleTypeDef * hmdf, MDF_SnapshotParamTypeDef * pSnapshotParam)

Function description

HAL_MDF_AcqStop

Function name

HAL_StatusTypeDef HAL_MDF_AcqStop (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_AcqStart_IT

Function name

HAL_StatusTypeDef HAL_MDF_AcqStart_IT (MDF_HandleTypeDef * hmdf, const MDF_FilterConfigTypeDef * pFilterConfig)

Function description

HAL_MDF_AcqStop_IT

Function name

HAL_StatusTypeDef HAL_MDF_AcqStop_IT (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_AcqStart_DMA

Function name

HAL_StatusTypeDef HAL_MDF_AcqStart_DMA (MDF_HandleTypeDef * hmdf, const MDF_FilterConfigTypeDef * pFilterConfig, const MDF_DmaConfigTypeDef * pDmaConfig)

Function description

HAL_MDF_AcqStop_DMA

Function name

HAL_StatusTypeDef HAL_MDF_AcqStop_DMA (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_GenerateTrgo

Function name

HAL_StatusTypeDef HAL_MDF_GenerateTrgo (const MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_SetDelay

Function name

HAL_StatusTypeDef HAL_MDF_SetDelay (MDF_HandleTypeDef * hmdf, uint32_t Delay)

Function description

HAL_MDF_GetDelay

Function name

HAL_StatusTypeDef HAL_MDF_GetDelay (const MDF_HandleTypeDef * hmdf, uint32_t * pDelay)

Function description

HAL_MDF_SetGain

Function name

HAL_StatusTypeDef HAL_MDF_SetGain (MDF_HandleTypeDef * hmdf, int32_t Gain)

Function description

HAL_MDF_GetGain

Function name

HAL_StatusTypeDef HAL_MDF_GetGain (const MDF_HandleTypeDef * hmdf, int32_t * pGain)

Function description

HAL_MDF_SetOffset

Function name

HAL_StatusTypeDef HAL_MDF_SetOffset (MDF_HandleTypeDef * hmdf, int32_t Offset)

Function description

HAL_MDF_GetOffset

Function name

HAL_StatusTypeDef HAL_MDF_GetOffset (const MDF_HandleTypeDef * hmdf, int32_t * pOffset)

Function description

HAL_MDF_PollForSndLvl

Function name

HAL_StatusTypeDef HAL_MDF_PollForSndLvl (MDF_HandleTypeDef * hmdf, uint32_t Timeout, uint32_t * pSoundLevel, uint32_t * pAmbientNoise)

Function description

HAL_MDF_PollForSad

Function name

HAL_StatusTypeDef HAL_MDF_PollForSad (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

HAL_MDF_AcqCpltCallback

Function name

void HAL_MDF_AcqCpltCallback (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_AcqHalfCpltCallback

Function name

void HAL_MDF_AcqHalfCpltCallback (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_SndLvlCallback

Function name

void HAL_MDF_SndLvlCallback (MDF_HandleTypeDef * hmdf, uint32_t SoundLevel, uint32_t AmbientNoise)

Function description

HAL_MDF_SadCallback

Function name

void HAL_MDF_SadCallback (MDF_HandleTypeDef * hmdf)

Function description

HAL_MDF_PollForCkab

Function name

HAL_StatusTypeDef HAL_MDF_PollForCkab (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

45.3 MDF Firmware driver defines

The following section lists the various define and macros of the module.

45.3.1 MDF

MDF

MDF acquisition mode

MDF_MODE_ASYNC_CONT

Asynchronous, continuous acquisition mode

MDF_MODE_ASYNC_SINGLE

Notes:

- Not available for ADF instance with SAD usage

Asynchronous, single-shot acquisition mode.

MDF_MODE_SYNC_CONT

Synchronous, continuous acquisition mode

MDF_MODE_SYNC_SINGLE

Notes:

- Not available for ADF instance with SAD usage

Synchronous, single-shot acquisition mode.

MDF_MODE_WINDOW_CONT

Notes:

- Not available for ADF instance with SAD usage

Window, continuous acquisition mode.

MDF_MODE_SYNC_SNAPSHOT

Notes:

- Not available for ADF instance

Synchronous, snapshot acquisition mode.

MDF break signals

MDF_NO_BREAK_SIGNAL

No break signal

MDF_TIM1_BREAK_SIGNAL

TIM1_BREAK signal

MDF_TIM1_BREAK2_SIGNAL

TIM1_BREAK2 signal

MDF_TIM8_BREAK_SIGNAL

TIM8_BREAK signal

MDF_TIM8_BREAK2_SIGNAL

TIM8_BREAK2 signal

MDF CIC mode

MDF_TWO_FILTERS_MCIC_FASTSINC

Notes:

- Not available for ADF instance

Two filters, main filter in FastSinc order.

MDF_TWO_FILTERS_MCIC_SINC1

Notes:

- Not available for ADF instance

Two filters, main filter in Sinc1 order.

MDF_TWO_FILTERS_MCIC_SINC2

Notes:

- Not available for ADF instance

Two filters, main filter in Sinc2 order.

MDF_TWO_FILTERS_MCIC_SINC3

Notes:

- Not available for ADF instance

Two filters, main filter in Sinc3 order.

MDF_ONE_FILTER_SINC4

One filter in Sinc4 order

MDF_ONE_FILTER_SINC5

One filter in Sinc5 order

MDF output clock trigger edge

MDF_CLOCK_TRIG_RISING_EDGE

Rising edge

MDF_CLOCK_TRIG_FALLING_EDGE

Falling edge

MDF output clock trigger source

MDF_CLOCK_TRIG_TRGO

MDF_CLOCK_TRIG_EXTI15

MDF_CLOCK_TRIG_EXTI11

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM1_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM1_TRGO2

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM3_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM4_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM6_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM7_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM8_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM8_TRGO2

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM15_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_LPTIM1_OUT

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_SAD_DET

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_SAD_TRGO

Notes:

- Not available for ADF instance

MDF data source

MDF_DATA_SOURCE_BSMX

Data from bitstream matrix

MDF_DATA_SOURCE_ADCITF1

Notes:

- Not available for ADF instance

Data from ADC interface 1.

MDF_DATA_SOURCE_ADCITF2

Notes:

- Not available for ADF instance

Data from ADC interface 2.

MDF error code

MDF_ERROR_NONE

No error

MDF_ERROR_ACQUISITION_OVERFLOW

Overflow occurs during acquisition

MDF_ERROR_RSF_OVERRUN

Overrun occurs on reshape filter

MDF_ERROR_CLOCK_ABSENCE

Clock absence detection occurs

MDF_ERROR_SHORT_CIRCUIT

Notes:

- Not used for ADF instance

Short circuit detection occurs.

MDF_ERROR_SATURATION

Saturation detection occurs

MDF_ERROR_OUT_OFF_LIMIT

Notes:

- Not used for ADF instance

Out-off limit detection occurs.

MDF_ERROR_DMA

DMA error occurs

MDF_ERROR_INVALID_CALLBACK

Invalid callback error occurs

MDF Exported Macros

__HAL_MDF_RESET_HANDLE_STATE

Description:

- Reset MDF handle state.

Parameters:

- __HANDLE__: MDF handle.

Return value:

- None

MDF RXFIFO threshold

MDF_FIFO_THRESHOLD_NOT_EMPTY

Event generated when RXFIFO is not empty

MDF_FIFO_THRESHOLD_HALF_FULL

Event generated when RXFIFO is half_full

MDF filter bitstream

MDF_BITSTREAM0_RISING

MDF_BITSTREAM0_FALLING

MDF_BITSTREAM1_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM1_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM2_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM2_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM3_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM3_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM4_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM4_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM5_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM5_FALLING

Notes:

- Not available for ADF instance

MDF filter trigger edge

MDF_FILTER_TRIG_RISING_EDGE

Rising edge

MDF_FILTER_TRIG_FALLING_EDGE

Falling edge

MDF filter trigger source

MDF_FILTER_TRIG_TRGO

MDF_FILTER_TRIG_OLD_EVENT

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_EXTI15

MDF_FILTER_TRIG_EXTI11

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM1_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM1_TRGO2

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM3_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM4_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM6_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM7_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM8_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM8_TRGO2

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM15_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_LPTIM1_OUT

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_ADF_SAD_DET

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_ADF_TRGO

Notes:

- Not available for ADF instance

MDF high pass filter cut-off frequency

MDF_HPF_CUTOFF_0_000625FPCM

Cut-off frequency of 0.000625xFpcm

MDF_HPF_CUTOFF_0_00125FPCM

Cut-off frequency of 0.00125xFpcm

MDF_HPF_CUTOFF_0_0025FPCM

Cut-off frequency of 0.0025xFpcm

MDF_HPF_CUTOFF_0_0095FPCM

Cut-off frequency of 0.0095xFpcm

MDF integrator output division

MDF_INTEGRATOR_OUTPUT_DIV_128

Integrator data outputs divided by 128

MDF_INTEGRATOR_OUTPUT_DIV_32

Integrator data outputs divided by 32

MDF_INTEGRATOR_OUTPUT_DIV_4

Integrator data outputs divided by 4

MDF_INTEGRATOR_OUTPUT_NO_DIV

Integrator data outputs not divided

MDF out-off limit detector CIC mode

MDF_OLD_FILTER_FASTSINC

Out-off limit detector filter in FastSinc order

MDF_OLD_FILTER_SINC1

Out-off limit detector filter in Sinc1 order

MDF_OLD_FILTER_SINC2

Out-off limit detector filter in Sinc2 order

MDF_OLD_FILTER_SINC3

Out-off limit detector filter in Sinc3 order

MDF out-off limit detector event configuration

MDF_OLD_SIGNAL_OUTSIDE_THRESHOLDS

Out-off limit detector event is generated if signal is outside thresholds

MDF_OLD_SIGNAL_IN_THRESHOLDS

Out-off limit detector event is generated if signal is in thresholds

MDF out-off limit detector threshold information

MDF_OLD_IN_THRESHOLDS

The signal was in thresholds when out-off limit detection occurs

MDF_OLD_HIGH_THRESHOLD

The signal was higher than high threshold when out-off limit detection occurs

MDF_OLD_LOW_THRESHOLD

The signal was lower than low threshold when out-off limit detection occurs

MDF output clock pins

MDF_OUTPUT_CLOCK_0

MDF_CCK0 is used as output clock

MDF_OUTPUT_CLOCK_1

MDF_CCK1 is used as output clock

MDF_OUTPUT_CLOCK_ALL

MDF_CCK0 and MDF_CCK1 are used as output clock

MDF reshape filter decimation ratio

MDF_RSF_DECIMATION_RATIO_4

Reshape filter decimation ratio is 4

MDF_RSF_DECIMATION_RATIO_1

Reshape filter decimation ratio is 1

MDF sound activity detector data memory transfer mode

MDF_SAD_NO_MEMORY_TRANSFER

No memory transfer

MDF_SAD_MEMORY_TRANSFER_IN_DETECT

Memory transfer only in detect state

MDF_SAD_MEMORY_TRANSFER_ALWAYS

Memory transfer always

MDF sound activity detector frame size

MDF_SAD_8_PCM_SAMPLES

Frame size of 8 PCM samples

MDF_SAD_16_PCM_SAMPLES

Frame size of 16 PCM samples

MDF_SAD_32_PCM_SAMPLES

Frame size of 32 PCM samples

MDF_SAD_64_PCM_SAMPLES

Frame size of 64 PCM samples

MDF_SAD_128_PCM_SAMPLES

Frame size of 128 PCM samples

MDF_SAD_256_PCM_SAMPLES

Frame size of 256 PCM samples

MDF_SAD_512_PCM_SAMPLES

Frame size of 512 PCM samples

MDF sound activity detector data hangover time window

MDF_SAD_HANGOVER_4_FRAMES

Hangover window of 4 frames

MDF_SAD_HANGOVER_8_FRAMES

Hangover window of 8 frames

MDF_SAD_HANGOVER_16_FRAMES

Hangover window of 16 frames

MDF_SAD_HANGOVER_32_FRAMES

Hangover window of 32 frames

MDF_SAD_HANGOVER_64_FRAMES

Hangover window of 64 frames

MDF_SAD_HANGOVER_128_FRAMES

Hangover window of 128 frames

MDF_SAD_HANGOVER_256_FRAMES

Hangover window of 256 frames

MDF_SAD_HANGOVER_512_FRAMES

Hangover window of 512 frames

MDF sound activity detector data learning frames

MDF_SAD_LEARNING_2_FRAMES

2 learning frames

MDF_SAD_LEARNING_4_FRAMES

4 learning frames

MDF_SAD_LEARNING_8_FRAMES

8 learning frames

MDF_SAD_LEARNING_16_FRAMES

16 learning frames

MDF_SAD_LEARNING_32_FRAMES

32 learning frames

MDF sound activity detector mode

MDF_SAD_VOICE_ACTIVITY_DETECTOR

Voice activity detector

MDF_SAD_SOUND_DETECTOR

Sound detector

MDF_SAD_AMBIENT_NOISE_DETECTOR

Ambient noise detector

MDF sound activity detector data signal to noise threshold

MDF_SAD_SIGNAL_NOISE_3_5DB

Signal to noise threshold is 3.5dB

MDF_SAD_SIGNAL_NOISE_6DB

Signal to noise threshold is 6dB

MDF_SAD_SIGNAL_NOISE_9_5DB

Signal to noise threshold is 9.5dB

MDF_SAD_SIGNAL_NOISE_12DB

Signal to noise threshold is 12dB

MDF_SAD_SIGNAL_NOISE_15_6DB

Signal to noise threshold is 15.6dB

MDF_SAD_SIGNAL_NOISE_18DB

Signal to noise threshold is 18dB

MDF_SAD_SIGNAL_NOISE_21_6DB

Signal to noise threshold is 21.6dB

MDF_SAD_SIGNAL_NOISE_24_1DB

Signal to noise threshold is 24.1dB

MDF_SAD_SIGNAL_NOISE_27_6DB

Signal to noise threshold is 27.6dB

MDF_SAD_SIGNAL_NOISE_30_1DB

Signal to noise threshold is 30.1dB

MDF sound activity detector trigger event

MDF_SAD_ENTER_DETECT

Event when SAD enters in detect state

MDF_SAD_ENTER_EXIT_DETECT

Event when SAD enters or exits from detect state

MDF serial interface clock source

MDF_SITF_CCK0_SOURCE

Common clock 0 source

MDF_SITF_CCK1_SOURCE

Common clock 1 source

MDF_SITF_CKI_SOURCE

Notes:

- Not available for ADF instance

Dedicated input clock source.

MDF serial interface mode

MDF_SITF_LF_MASTER_SPI_MODE

Low frequency master SPI mode

MDF_SITF_NORMAL_SPI_MODE

Normal SPI mode

MDF_SITF_MANCHESTER_FALLING_MODE

Manchester mode rising edge logic 0 and falling edge logic 1

MDF_SITF_MANCHESTER_RISING_MODE

Manchester mode rising edge logic 1 and falling edge logic 0

MDF snapshot format

MDF_SNAPSHOT_23BITS

Snapshot data resolution of 23 bits

MDF_SNAPSHOT_16BITS

Snapshot data resolution of 16 bits

46 HAL MDIOS Generic Driver

46.1 MDIOS Firmware driver registers structures

46.1.1 MDIOS_InitTypeDef

MDIOS_InitTypeDef is defined in the stm32n6xx_hal_mdios.h

Data Fields

- ***uint32_t PortAddress***
- ***uint32_t PreambleCheck***

Field Documentation

- ***uint32_t MDIOS_InitTypeDef::PortAddress***
  Specifies the MDIOS port address. This parameter can be a value from 0 to 31
- ***uint32_t MDIOS_InitTypeDef::PreambleCheck***
  Specifies whether the preamble check is enabled or disabled. This parameter can be a value of ***MDIOS_Preamble_Check***

46.1.2 MDIOS_HandleTypeDef

MDIOS_HandleTypeDef is defined in the stm32n6xx_hal_mdios.h

Data Fields

- ***MDIOS_TypeDef * Instance***
- ***MDIOS_InitTypeDef Init***
- ***__IO HAL_MDIOS_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***HAL_LockTypeDef Lock***

Field Documentation

- ***MDIOS_TypeDef* MDIOS_HandleTypeDef::Instance***
  Register base address
- ***MDIOS_InitTypeDef MDIOS_HandleTypeDef::Init***
  MDIOS Init Structure
- ***__IO HAL_MDIOS_StateTypeDef MDIOS_HandleTypeDef::State***
  MDIOS communication state This parameter can be a value of of **HAL_MDIOS_StateTypeDef**
- ***__IO uint32_t MDIOS_HandleTypeDef::ErrorCode***
  Holds the global Error code of the MDIOS HAL status machine This parameter can be a value of of ***MDIOS_Error_Code***
- ***HAL_LockTypeDef MDIOS_HandleTypeDef::Lock***
  MDIOS Lock

46.2 MDIOS Firmware driver API description

The following section lists the various functions of the MDIOS library.

46.2.1 How to use this driver

Note: A callback is executed for each generated interrupt, so the driver provide the following HAL_MDIOS_WriteCpltCallback(), HAL_MDIOS_ReadCpltCallback() and HAL_MDIOS_ErrorCallback()

Note: HAL_MDIOS_IRQHandler() must be called from the MDIOS IRQ Handler, to handle the interrupt and execute the previous callbacks (#) Reset the MDIOS peripheral and all related resources by calling the HAL_MDIOS_DeInit() API. (##) HAL_MDIOS_MspDeInit() must be implemented to reset low level resources (GPIO, Clocks, NVIC configuration ...)

Callback registration

46.2.2 Detailed description of functions

HAL_MDIOS_Init

Function name

HAL_StatusTypeDef HAL_MDIOS_Init (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_DeInit

Function name

HAL_StatusTypeDef HAL_MDIOS_DeInit (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_MspInit

Function name

void HAL_MDIOS_MspInit (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_MspDeInit

Function name

void HAL_MDIOS_MspDeInit (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_WriteReg

Function name

HAL_StatusTypeDef HAL_MDIOS_WriteReg (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum, uint16_t Data)

Function description

HAL_MDIOS_ReadReg

Function name

HAL_StatusTypeDef HAL_MDIOS_ReadReg (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum, uint16_t * pData)

Function description

HAL_MDIOS_GetWrittenRegAddress

Function name

uint32_t HAL_MDIOS_GetWrittenRegAddress (const MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_GetReadRegAddress

Function name

uint32_t HAL_MDIOS_GetReadRegAddress (const MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_ClearWriteRegAddress

Function name

HAL_StatusTypeDef HAL_MDIOS_ClearWriteRegAddress (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum)

Function description

HAL_MDIOS_ClearReadRegAddress

Function name

HAL_StatusTypeDef HAL_MDIOS_ClearReadRegAddress (MDIOS_HandleTypeDef * hmdios, uint32_t RegNum)

Function description

HAL_MDIOS_EnableEvents

Function name

HAL_StatusTypeDef HAL_MDIOS_EnableEvents (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_IRQHandler

Function name

void HAL_MDIOS_IRQHandler (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_WriteCpltCallback

Function name

void HAL_MDIOS_WriteCpltCallback (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_ReadCpltCallback

Function name

void HAL_MDIOS_ReadCpltCallback (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_ErrorCallback

Function name

void HAL_MDIOS_ErrorCallback (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_WakeUpCallback

Function name

void HAL_MDIOS_WakeUpCallback (MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_GetError

Function name

uint32_t HAL_MDIOS_GetError (const MDIOS_HandleTypeDef * hmdios)

Function description

HAL_MDIOS_GetState

Function name

HAL_MDIOS_StateTypeDef HAL_MDIOS_GetState (const MDIOS_HandleTypeDef * hmdios)

Function description

46.3 MDIOS Firmware driver defines

The following section lists the various define and macros of the module.

46.3.1 MDIOS

MDIOS

MDIOS Error Code

HAL_MDIOS_ERROR_NONE

No error

HAL_MDIOS_ERROR_PARAM

Busy error

HAL_MDIOS_ERROR_BUSY

Parameter error

HAL_MDIOS_ERROR_TIMEOUT

Timeout error

HAL_MDIOS_ERROR_DATA

Data transfer error

MDIOS Exported Macros

__HAL_MDIOS_RESET_HANDLE_STATE

Description:

- Reset MDIOS handle state.

Parameters:

- __HANDLE__: MDIOS handle.

Return value:

- None

__HAL_MDIOS_ENABLE

Description:

- Enable/Disable the MDIOS peripheral.

Parameters:

- __HANDLE__: specifies the MDIOS handle.

Return value:

- None

__HAL_MDIOS_DISABLE

__HAL_MDIOS_ENABLE_IT

Description:

- Enable the MDIOS device interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __INTERRUPT__: : specifies the MDIOS interrupt sources to be enabled. This parameter can be one or a combination of the following values:
  - MDIOS_IT_WRITE: Register write interrupt
  - MDIOS_IT_READ: Register read interrupt
  - MDIOS_IT_ERROR: Error interrupt

Return value:

- None

__HAL_MDIOS_DISABLE_IT

Description:

- Disable the MDIOS device interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __INTERRUPT__: : specifies the MDIOS interrupt sources to be disabled. This parameter can be one or a combination of the following values:
  - MDIOS_IT_WRITE: Register write interrupt
  - MDIOS_IT_READ: Register read interrupt
  - MDIOS_IT_ERROR: Error interrupt

Return value:

- None

__HAL_MDIOS_GET_WRITE_FLAG

Description:

- Set MDIOS slave get write register flag.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: specifies the write register flag

Return value:

- The: state of write flag

__HAL_MDIOS_GET_READ_FLAG

Description:

- MDIOS slave get read register flag.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: specifies the read register flag

Return value:

- The: state of read flag

__HAL_MDIOS_GET_ERROR_FLAG

Description:

- MDIOS slave get interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: : specifies the Error flag. This parameter can be one or a combination of the following values:
  - MDIOS_TURNARROUND_ERROR_FLAG: Register write interrupt
  - MDIOS_START_ERROR_FLAG: Register read interrupt
  - MDIOS_PREAMBLE_ERROR_FLAG: Error interrupt

Return value:

- The: state of the error flag

__HAL_MDIOS_CLEAR_ERROR_FLAG

Description:

- MDIOS slave clear interrupt.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __FLAG__: : specifies the Error flag. This parameter can be one or a combination of the following values:
  - MDIOS_TURNARROUND_ERROR_FLAG: Register write interrupt
  - MDIOS_START_ERROR_FLAG: Register read interrupt
  - MDIOS_PREAMBLE_ERROR_FLAG: Error interrupt

Return value:

- none

__HAL_MDIOS_GET_IT_SOURCE

Description:

- Checks whether the specified MDIOS interrupt is set or not.

Parameters:

- __HANDLE__: specifies the MDIOS handle.
- __INTERRUPT__: : specifies the MDIOS interrupt sources This parameter can be one or a combination of the following values:
  - MDIOS_IT_WRITE: Register write interrupt
  - MDIOS_IT_READ: Register read interrupt
  - MDIOS_IT_ERROR: Error interrupt

Return value:

- The: state of the interrupt source

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_IT

Description:

- Enable the MDIOS WAKEUP Exti Line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be enabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_MDIOS_WAKEUP_EXTI_GET_FLAG

Description:

- checks whether the specified MDIOS WAKEUP Exti interrupt flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be cleared. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- EXTI: MDIOS WAKEUP Line Status.

__HAL_MDIOS_WAKEUP_EXTI_CLEAR_FLAG

Description:

- Clear the MDIOS WAKEUP Exti flag.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP Exti sources to be cleared. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None.

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_RISING_EDGE

Description:

- enable rising edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_MDIOS_WAKEUP_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- enable falling edge interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

__HAL_MDIOS_WAKEUP_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on selected EXTI line.

Parameters:

- __EXTI_LINE__: specifies the MDIOS WAKEUP EXTI sources to be disabled. This parameter can be:
  - MDIOS_WAKEUP_EXTI_LINE

Return value:

- None

47 HAL MMC Generic Driver

47.1 MMC Firmware driver registers structures

47.1.1 HAL_MMC_CardInfoTypeDef

HAL_MMC_CardInfoTypeDef is defined in the stm32n6xx_hal_mmc.h

Data Fields

- ***uint32_t CardType***
- ***uint32_t Class***
- ***uint32_t RelCardAdd***
- ***uint32_t BlockNbr***
- ***uint32_t BlockSize***
- ***uint32_t LogBlockNbr***
- ***uint32_t LogBlockSize***

Field Documentation

- ***uint32_t HAL_MMC_CardInfoTypeDef::CardType***
  Specifies the card Type
- ***uint32_t HAL_MMC_CardInfoTypeDef::Class***
  Specifies the class of the card class
- ***uint32_t HAL_MMC_CardInfoTypeDef::RelCardAdd***
  Specifies the Relative Card Address
- ***uint32_t HAL_MMC_CardInfoTypeDef::BlockNbr***
  Specifies the Card Capacity in blocks
- ***uint32_t HAL_MMC_CardInfoTypeDef::BlockSize***
  Specifies one block size in bytes
- ***uint32_t HAL_MMC_CardInfoTypeDef::LogBlockNbr***
  Specifies the Card logical Capacity in blocks
- ***uint32_t HAL_MMC_CardInfoTypeDef::LogBlockSize***
  Specifies logical block size in bytes

47.1.2 __MMC_HandleTypeDef

__MMC_HandleTypeDef is defined in the stm32n6xx_hal_mmc.h

Data Fields

- ***MMC_TypeDef * Instance***

  CID CRC
- ***__IO uint8_t HAL_MMC_CardCIDTypeDef::Reserved2***
  Always 1

47.2 MMC Firmware driver API description

The following section lists the various functions of the MMC library.

47.2.1 How to use this driver

This driver implements a high level communication layer for read and write from/to this memory. The needed STM32 hardware resources (SDMMC and GPIO) are performed by the user in HAL_MMC_MspInit() function (MSP layer). Basically, the MSP layer configuration should be the same as we provide in the examples. You can easily tailor this configuration according to hardware resources.

This driver is a generic layered driver for SDMMC memories which uses the HAL SDMMC driver functions to interface with MMC and eMMC cards devices. It is used as follows:

1. Initialize the SDMMC low level resources by implement the HAL_MMC_MspInit() API:
   a. Enable the SDMMC interface clock using __HAL_RCC_SDMMC_CLK_ENABLE();
   b. SDMMC pins configuration for MMC card
      - Enable the clock for the SDMMC GPIOs using the functions __HAL_RCC_GPIOx_CLK_ENABLE();
      - Configure these SDMMC pins as alternate function pull-up using HAL_GPIO_Init() and according to your pin assignment;
   c. NVIC configuration if you need to use interrupt process (HAL_MMC_ReadBlocks_IT() and HAL_MMC_WriteBlocks_IT() APIs).
      - Configure the SDMMC interrupt priorities using function HAL_NVIC_SetPriority();
      - Enable the NVIC SDMMC IRQs using function HAL_NVIC_EnableIRQ()
      - SDMMC interrupts are managed using the macros __HAL_MMC_ENABLE_IT() and __HAL_MMC_DISABLE_IT() inside the communication process.
      - SDMMC interrupts pending bits are managed using the macros __HAL_MMC_GET_IT() and __HAL_MMC_CLEAR_IT()
   d. No general propose DMA Configuration is needed, an Internal DMA for SDMMC Peripheral are used.
2. At this stage, you can perform MMC read/write/erase operations after MMC card initialization

MMC Card Initialization and configuration

To initialize the MMC Card, use the HAL_MMC_Init() function. It Initializes SDMMC Peripheral (STM32 side) and the MMC Card, and put it into StandBy State (Ready for data transfer). This function provide the following operations:

1. Initialize the SDMMC peripheral interface with default configuration. The initialization process is done at 400KHz. You can change or adapt this frequency by adjusting the "ClockDiv" field. The MMC Card frequency (SDMMC_CK) is computed as follows: SDMMC_CK = SDMMCCLK / (2 * ClockDiv) In initialization mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 400KHz. This phase of initialization is done through SDMMC_Init() and SDMMC_PowerState_ON() SDMMC low level APIs.
2. Initialize the MMC card. The API used is HAL_MMC_InitCard(). This phase allows the card initialization and identification and check the MMC Card type (Standard Capacity or High Capacity) The initialization flow is compatible with MMC standard. This API (HAL_MMC_InitCard()) could be used also to reinitialize the card in case of plug-off plug-in.
3. Configure the MMC Card Data transfer frequency. By Default, the card transfer frequency by adjusting the "ClockDiv" field. In transfer mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 25MHz and 100MHz in High-speed mode switch.
4. Select the corresponding MMC Card according to the address read with the step 2.
5. Configure the MMC Card in wide bus mode: 4-bits data.
6. Select the MMC Card partition using HAL_MMC_SwitchPartition()

MMC Card Read operation

- You can read from MMC card in polling mode by using function HAL_MMC_ReadBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can read from MMC card in DMA mode by using function HAL_MMC_ReadBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Rx interrupt event.
- You can read from MMC card in Interrupt mode by using function HAL_MMC_ReadBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Rx interrupt event.

MMC Card Write operation

- You can write to MMC card in polling mode by using function HAL_MMC_WriteBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can write to MMC card in DMA mode by using function HAL_MMC_WriteBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 byte). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Tx interrupt event.
- You can write to MMC card in Interrupt mode by using function HAL_MMC_WriteBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Tx interrupt event.

MMC card information

- To get MMC card information, you can use the function HAL_MMC_GetCardInfo(). It returns useful information about the MMC card such as block size, card type, block number ...

MMC card CSD register

- The HAL_MMC_GetCardCSD() API allows to get the parameters of the CSD register. Some of the CSD parameters are useful for card initialization and identification.

MMC card CID register

- The HAL_MMC_GetCardCID() API allows to get the parameters of the CID register. Some of the CID parameters are useful for card initialization and identification.

MMC Card Reply Protected Memory Block (RPMB) Key Programming operation

- You can program the authentication key of RPMB area in polling mode by using function HAL_MMC_RPMB_ProgramAuthenticationKey(). This function is only used once during the life of an MMC card. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.
- You can program the authentication key of RPMB area in Interrupt mode by using function HAL_MMC_RPMB_ProgramAuthenticationKey_IT(). This function is only used once during the life of an MMC card. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.

MMC Card Reply Protected Memory Block (RPMB) write counter operation

- You can get the write counter value of RPMB area in polling mode by using function HAL_MMC_RPMB_GetWriteCounter().
- You can get the write counter value of RPMB area in Interrupt mode by using function HAL_MMC_RPMB_GetWriteCounter_IT().

MMC Card Reply Protected Memory Block (RPMB) write operation

- You can write to the RPMB area of MMC card in polling mode by using function HAL_MMC_WriteBlocks(). This function supports the one, two, or thirty two blocks write operation (with 512-bytes block length). You can choose the number of blocks at the multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.

- You can write to the RPMB area of MMC card in Interrupt mode by using function HAL_MMC_WriteBlocks_IT(). This function supports the one, two, or thirty two blocks write operation (with 512-bytes block length). You can choose the number of blocks at the multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.

MMC Card Reply Protected Memory Block (RPMB) read operation

- You can read from the RPMB area of MMC card in polling mode by using function HAL_MMC_RPMB_ReadBlocks(). The block size should be chosen as multiple of 512 bytes. You can choose the number of blocks by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for MMC card state.
- You can read from the RPMB area of MMC card in Interrupt mode by using function HAL_MMC_RPMB_ReadBlocks_IT(). The block size should be chosen as multiple of 512 bytes. You can choose the number of blocks by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for MMC card state.

MMC HAL driver macros list

Below the list of most used macros in MMC HAL driver.

- __HAL_MMC_ENABLE_IT: Enable the MMC device interrupt
- __HAL_MMC_DISABLE_IT: Disable the MMC device interrupt
- __HAL_MMC_GET_FLAG:Check whether the specified MMC flag is set or not
- __HAL_MMC_CLEAR_FLAG: Clear the MMC's pending flags

Note: You can refer to the MMC HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_MMC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_MMC_RegisterCallback() to register a user callback, it allows to register following callbacks:

- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMALnkLstBufCpltCallback : callback when the DMA reception of linked list node buffer is completed.
- Write_DMALnkLstBufCpltCallback : callback when the DMA transmission of linked list node buffer is completed.
- MspInitCallback : MMC MspInit.
- MspDeInitCallback : MMC MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_MMC_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMADblBuf0CpltCallback : callback when the DMA reception of first buffer is completed.
- Read_DMADblBuf1CpltCallback : callback when the DMA reception of second buffer is completed.
- Write_DMADblBuf0CpltCallback : callback when the DMA transmission of first buffer is completed.
- Write_DMADblBuf1CpltCallback : callback when the DMA transmission of second buffer is completed.
- MspInitCallback : MMC MspInit.

- MspDeInitCallback : MMC MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_MMC_Init and if the state is HAL_MMC_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_MMC_Init and HAL_MMC_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_MMC_Init and HAL_MMC_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_MMC_RegisterCallback before calling HAL_MMC_DeInit or HAL_MMC_Init function. When The compilation define USE_HAL_MMC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

47.2.2 Detailed description of functions

HAL_MMC_Init

Function name

HAL_StatusTypeDef HAL_MMC_Init (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_InitCard

Function name

HAL_StatusTypeDef HAL_MMC_InitCard (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_DeInit

Function name

HAL_StatusTypeDef HAL_MMC_DeInit (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_MspInit

Function name

void HAL_MMC_MspInit (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_MspDeInit

Function name

void HAL_MMC_MspDeInit (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

HAL_MMC_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

HAL_MMC_Erase

Function name

HAL_StatusTypeDef HAL_MMC_Erase (MMC_HandleTypeDef * hmmc, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

HAL_MMC_ReadBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_IT (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMC_WriteBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMC_ReadBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_DMA (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMC_WriteBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_DMA (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMC_IRQHandler

Function name

void HAL_MMC_IRQHandler (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_TxCpltCallback

Function name

void HAL_MMC_TxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_RxCpltCallback

Function name

void HAL_MMC_RxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_ErrorCallback

Function name

void HAL_MMC_ErrorCallback (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_AbortCallback

Function name

void HAL_MMC_AbortCallback (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_RegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId, pMMC_CallbackTypeDef pCallback)

Function description

HAL_MMC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_UnRegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId)

Function description

HAL_MMC_ConfigWideBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigWideBusOperation (MMC_HandleTypeDef * hmmc, uint32_t WideMode)

Function description

HAL_MMC_ConfigSpeedBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSpeedBusOperation (MMC_HandleTypeDef * hmmc, uint32_t SpeedMode)

Function description

HAL_MMC_SwitchPartition

Function name

HAL_StatusTypeDef HAL_MMC_SwitchPartition (MMC_HandleTypeDef * hmmc, HAL_MMC_PartitionTypeDef Partition)

Function description

HAL_MMC_GetCardState

Function name

HAL_MMC_CardStateTypeDef HAL_MMC_GetCardState (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_GetCardCID

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCID (const MMC_HandleTypeDef * hmmc, HAL_MMC_CardCIDTypeDef * pCID)

Function description

HAL_MMC_GetCardCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCSD (MMC_HandleTypeDef * hmmc, HAL_MMC_CardCSDTypeDef * pCSD)

Function description

HAL_MMC_GetCardInfo

Function name

HAL_StatusTypeDef HAL_MMC_GetCardInfo (const MMC_HandleTypeDef * hmmc, HAL_MMC_CardInfoTypeDef * pCardInfo)

Function description

HAL_MMC_GetCardExtCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardExtCSD (MMC_HandleTypeDef * hmmc, uint32_t * pExtCSD, uint32_t Timeout)

Function description

HAL_MMC_GetState

Function name

HAL_MMC_StateTypeDef HAL_MMC_GetState (const MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_GetError

Function name

uint32_t HAL_MMC_GetError (const MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_GetRPMBError

Function name

uint32_t HAL_MMC_GetRPMBError (const MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_Abort

Function name

HAL_StatusTypeDef HAL_MMC_Abort (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_Abort_IT

Function name

HAL_StatusTypeDef HAL_MMC_Abort_IT (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_EraseSequence

Function name

HAL_StatusTypeDef HAL_MMC_EraseSequence (MMC_HandleTypeDef * hmmc, uint32_t EraseType, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

HAL_MMC_Sanitize

Function name

HAL_StatusTypeDef HAL_MMC_Sanitize (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_ConfigSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t SRTMode)

Function description

HAL_MMC_GetSupportedSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_GetSupportedSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t * SupportedSRT)

Function description

HAL_MMC_SleepDevice

Function name

HAL_StatusTypeDef HAL_MMC_SleepDevice (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_AwakeDevice

Function name

HAL_StatusTypeDef HAL_MMC_AwakeDevice (MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_RPMB_ProgramAuthenticationKey

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ProgramAuthenticationKey (MMC_HandleTypeDef * hmmc, const uint8_t * pKey, uint32_t Timeout)

Function description

HAL_MMC_RPMB_ProgramAuthenticationKey_IT

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ProgramAuthenticationKey_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pKey, uint32_t Timeout)

Function description

HAL_MMC_RPMB_GetWriteCounter

Function name

uint32_t HAL_MMC_RPMB_GetWriteCounter (MMC_HandleTypeDef * hmmc, uint8_t * pNonce, uint32_t Timeout)

Function description

HAL_MMC_RPMB_GetWriteCounter_IT

Function name

uint32_t HAL_MMC_RPMB_GetWriteCounter_IT (MMC_HandleTypeDef * hmmc, uint8_t * pNonce)

Function description

HAL_MMC_RPMB_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_WriteBlocks (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pMAC, uint32_t Timeout)

Function description

HAL_MMC_RPMB_WriteBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_WriteBlocks_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pMAC)

Function description

HAL_MMC_RPMB_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ReadBlocks (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pNonce, uint8_t * pMAC, uint32_t Timeout)

Function description

HAL_MMC_RPMB_ReadBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ReadBlocks_IT (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pNonce, uint8_t * pMAC)

Function description

47.3 MMC Firmware driver defines

The following section lists the various define and macros of the module.

47.3.1 MMC

MMC

MMC Error status enumeration Structure definition

HAL_MMC_ERROR_NONE

No error

HAL_MMC_ERROR_CMD_CRC_FAIL

Command response received (but CRC check failed)

HAL_MMC_ERROR_DATA_CRC_FAIL

Data block sent/received (CRC check failed)

HAL_MMC_ERROR_CMD_RSP_TIMEOUT

Command response timeout

HAL_MMC_ERROR_DATA_TIMEOUT

Data timeout

HAL_MMC_ERROR_TX_UNDERRUN

Transmit FIFO underrun

HAL_MMC_ERROR_RX_OVERRUN

Receive FIFO overrun

HAL_MMC_ERROR_ADDR_MISALIGNED

Misaligned address

HAL_MMC_ERROR_BLOCK_LEN_ERR

Transferred block length is not allowed for the card or the number of transferred bytes does not match the block length

HAL_MMC_ERROR_ERASE_SEQ_ERR

An error in the sequence of erase command occurs

HAL_MMC_ERROR_BAD_ERASE_PARAM

An invalid selection for erase groups

HAL_MMC_ERROR_WRITE_PROT_VIOLATION

Attempt to program a write protect block

HAL_MMC_ERROR_LOCK_UNLOCK_FAILED

Sequence or password error has been detected in unlock command or if there was an attempt to access a locked card

HAL_MMC_ERROR_COM_CRC_FAILED

CRC check of the previous command failed

HAL_MMC_ERROR_ILLEGAL_CMD

Command is not legal for the card state

HAL_MMC_ERROR_CARD_ECC_FAILED

Card internal ECC was applied but failed to correct the data

HAL_MMC_ERROR_CC_ERR

Internal card controller error

HAL_MMC_ERROR_GENERAL_UNKNOWN_ERR

General or unknown error

HAL_MMC_ERROR_STREAM_READ_UNDERRUN

The card could not sustain data reading in stream rmode

HAL_MMC_ERROR_STREAM_WRITE_OVERRUN

The card could not sustain data programming in stream mode

HAL_MMC_ERROR_CID_CSD_OVERWRITE

CID/CSD overwrite error

HAL_MMC_ERROR_WP_ERASE_SKIP

Only partial address space was erased

HAL_MMC_ERROR_CARD_ECC_DISABLED

Command has been executed without using internal ECC

HAL_MMC_ERROR_ERASE_RESET

Erase sequence was cleared before executing because an out of erase sequence command was received

HAL_MMC_ERROR_AKE_SEQ_ERR

Error in sequence of authentication

HAL_MMC_ERROR_INVALID_VOLTRANGE

Error in case of invalid voltage range

HAL_MMC_ERROR_ADDR_OUT_OF_RANGE

Error when addressed block is out of range

HAL_MMC_ERROR_REQUEST_NOT_APPLICABLE

Error when command request is not applicable

HAL_MMC_ERROR_PARAM

the used parameter is not valid

HAL_MMC_ERROR_UNSUPPORTED_FEATURE

Error when feature is not insupported

HAL_MMC_ERROR_BUSY

Error when transfer process is busy

HAL_MMC_ERROR_DMA

Error while DMA transfer

HAL_MMC_ERROR_TIMEOUT

Timeout error response results after operating with RPMB partition

HAL_MMC_ERROR_RPMB_OPERATION_OK

Operation OK

HAL_MMC_ERROR_RPMB_GENERAL_FAILURE

General failure

HAL_MMC_ERROR_RPMB_AUTHENTICATION_FAILURE

Authentication failure

HAL_MMC_ERROR_RPMB_COUNTER_FAILURE

Counter failure

HAL_MMC_ERROR_RPMB_ADDRESS_FAILURE

Address failure

HAL_MMC_ERROR_RPMB_WRITE_FAILURE

Write failure

HAL_MMC_ERROR_RPMB_READ_FAILURE

Read failure

HAL_MMC_ERROR_RPMB_KEY_NOT_YET_PROG

Authentication Key not yet programmed

HAL_MMC_ERROR_RPMB_COUNTER_EXPIRED

Write Counter has expired i.e. reached its max value

HAL_MMC_ERROR_INVALID_CALLBACK

Invalid callback error

MMC context enumeration

MMC_CONTEXT_NONE

None

MMC_CONTEXT_READ_SINGLE_BLOCK

Read single block operation

MMC_CONTEXT_READ_MULTIPLE_BLOCK

Read multiple blocks operation

MMC_CONTEXT_WRITE_SINGLE_BLOCK

Write single block operation

MMC_CONTEXT_WRITE_MULTIPLE_BLOCK

Write multiple blocks operation

MMC_CONTEXT_IT

Process in Interrupt mode

MMC_CONTEXT_DMA

Process in DMA mode

MMC Voltage mode

MMC_HIGH_VOLTAGE_RANGE

High voltage in byte mode

MMC_DUAL_VOLTAGE_RANGE

Dual voltage in byte mode

MMC_LOW_VOLTAGE_RANGE

Low voltage in byte mode

EMMC_HIGH_VOLTAGE_RANGE

High voltage in sector mode

EMMC_DUAL_VOLTAGE_RANGE

Dual voltage in sector mode

EMMC_LOW_VOLTAGE_RANGE

Low voltage in sector mode

MMC_INVALID_VOLTAGE_RANGE

MMC Memory Cards

MMC_LOW_CAPACITY_CARD

MMC Card Capacity <=2Gbytes

MMC_HIGH_CAPACITY_CARD

MMC Card Capacity >2Gbytes and <2Tbytes

MMC Erase Type

HAL_MMC_ERASE

Erase the erase groups identified by CMD35 & 36

HAL_MMC_TRIM

Erase the write blocks identified by CMD35 & 36

HAL_MMC_DISCARD

Discard the write blocks identified by CMD35 & 36

HAL_MMC_SECURE_ERASE

Perform a secure purge according SRT on the erase groups identified by CMD35 & 36

HAL_MMC_SECURE_TRIM_STEP1

Mark the write blocks identified by CMD35 & 36 for secure erase

HAL_MMC_SECURE_TRIM_STEP2

Perform a secure purge according SRT on the write blocks previously identified

IS_MMC_ERASE_TYPE

MMC Secure Removal Type

HAL_MMC_SRT_ERASE

Information removed by an erase

HAL_MMC_SRT_WRITE_CHAR_ERASE

Information removed by an overwriting with a character followed by an erase

HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM

Information removed by an overwriting with a character, its complement then a random character

HAL_MMC_SRT_VENDOR_DEFINED

Information removed using a vendor defined

IS_MMC_SRT_TYPE

MMC Partitions types

HAL_MMC_USER_AREA_PARTITION

User area partition

HAL_MMC_BOOT_PARTITION1

Boot partition 1

HAL_MMC_BOOT_PARTITION2

Boot partition 2

HAL_MMC_RPMB_PARTITION

RPMB partition

Exported Constants

MMC_BLOCKSIZE

Block size is 512 bytes

MMC Exported Macros

__HAL_MMC_RESET_HANDLE_STATE

Description:

- Reset MMC handle state.

Parameters:

- __HANDLE__: MMC Handle.

Return value:

- None

__HAL_MMC_ENABLE_IT

Description:

- Enable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be enabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_DISABLE_IT

Description:

- Disable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be disabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_GET_FLAG

Description:

- Check whether the specified MMC flag is set or not.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_DPSMACT: Data path state machine active
  - SDMMC_FLAG_CPSMACT: Command path state machine active
  - SDMMC_FLAG_TXFIFOHE: Transmit FIFO Half Empty
  - SDMMC_FLAG_RXFIFOHF: Receive FIFO Half Full
  - SDMMC_FLAG_TXFIFOF: Transmit FIFO full
  - SDMMC_FLAG_RXFIFOF: Receive FIFO full
  - SDMMC_FLAG_TXFIFOE: Transmit FIFO empty
  - SDMMC_FLAG_RXFIFOE: Receive FIFO empty
  - SDMMC_FLAG_BUSYD0: Inverted value of SDMMC_D0 line (Busy)
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- The: new state of MMC FLAG (SET or RESET).

__HAL_MMC_CLEAR_FLAG

Description:

- Clear the MMC's pending flags.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to clear. This parameter can be one or a combination of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- None

__HAL_MMC_GET_IT

Description:

- Check whether the specified MMC interrupt has occurred or not.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt source to check. This parameter can be one of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- The: new state of MMC IT (SET or RESET).

__HAL_MMC_CLEAR_IT

Description:

- Clear the MMC's interrupt pending bits.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

MMC Card State enumeration structure

HAL_MMC_CARD_IDLE

Card is in idle state (can't be checked by CMD13)

HAL_MMC_CARD_READY

Card state is ready (can't be checked by CMD13)

HAL_MMC_CARD_IDENTIFICATION

Card is in identification state (can't be checked by CMD13)

HAL_MMC_CARD_STANDBY

Card is in standby state

HAL_MMC_CARD_TRANSFER

Card is in transfer state

HAL_MMC_CARD_SENDING

Card is sending an operation

HAL_MMC_CARD_RECEIVING

Card is receiving operation information

HAL_MMC_CARD_PROGRAMMING

Card is in programming state

HAL_MMC_CARD_DISCONNECTED

Card is disconnected

HAL_MMC_CARD_BUSTEST

Card is in bus test state

HAL_MMC_CARD_SLEEP

Card is in sleep state (can't be checked by CMD13)

HAL_MMC_CARD_ERROR

Card response Error (can't be checked by CMD13)

MMC_TypeDef

48 HAL MMC Extension Driver

48.1 MMCEx Firmware driver API description

The following section lists the various functions of the MMCEx library.

48.1.1 How to use this driver

The MMC Extension HAL driver can be used as follows:

- Configure Buffer0 and Buffer1 start address and Buffer size using HAL_MMCEx_ConfigDMAMultiBuffer() function.
- Start Read and Write for multibuffer mode using HAL_MMCEx_ReadBlocksDMAMultiBuffer() and HAL_MMCEx_WriteBlocksDMAMultiBuffer() functions.

48.1.2 Detailed description of functions

HAL_MMCEx_DMALinkedList_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_ReadBlocks (MMC_HandleTypeDef * hmmc, const MMC_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMCEx_DMALinkedList_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_WriteBlocks (MMC_HandleTypeDef * hmmc, const MMC_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMCEx_DMALinkedList_BuildNode

Function name

49.2 NAND Firmware driver API description

The following section lists the various functions of the NAND library.

49.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NAND flash memories. It uses the FMC layer functions to interface with NAND devices. This driver is used as follows:

- NAND flash memory configuration sequence using the function HAL_NAND_Init() with control and timing parameters for both common and attribute spaces.
- Read NAND flash memory maker and device IDs using the function HAL_NAND_Read_ID(). The read information is stored in the NAND_ID_TypeDef structure declared by the function caller.

- Access NAND flash memory by read/write operations using the functions HAL_NAND_Read_Page_8b()/ HAL_NAND_Read_SpareArea_8b(), HAL_NAND_Write_Page_8b()/HAL_NAND_Write_SpareArea_8b(), HAL_NAND_Read_Page_16b()/HAL_NAND_Read_SpareArea_16b(), HAL_NAND_Write_Page_16b()/ HAL_NAND_Write_SpareArea_16b() to read/write page(s)/spare area(s). These functions use specific device information (Block, page size..) predefined by the user in the NAND_DeviceConfigTypeDef structure. The read/write address information is contained by the Nand_Address_Typedef structure passed as parameter.
- Perform NAND flash Reset chip operation using the function HAL_NAND_Reset().
- Perform NAND flash erase block operation using the function HAL_NAND_Erase_Block(). The erase block address information is contained in the Nand_Address_Typedef structure passed as parameter.
- Read the NAND flash status operation using the function HAL_NAND_Read_Status().
- You can also control the NAND device by calling the control APIs HAL_NAND_ECC_Enable()/ HAL_NAND_ECC_Disable() to respectively enable/disable the ECC code correction feature or the function HAL_NAND_GetECC() to get the ECC correction code.
- You can monitor the NAND device HAL state by calling the function HAL_NAND_GetState()

Note: This driver is a set of generic APIs which handle standard NAND flash operations. If a NAND flash device contains different operations and/or implementations, it should be implemented separately.

Callback registration

The compilation define USE_HAL_NAND_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NAND_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NAND_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NAND_Init and if the state is HAL_NAND_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_NAND_Init and HAL_NAND_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NAND_Init and HAL_NAND_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NAND_RegisterCallback before calling HAL_NAND_DeInit or HAL_NAND_Init function. When The compilation define USE_HAL_NAND_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

  NOR Msp DeInit callback

50.2 NOR Firmware driver API description

The following section lists the various functions of the NOR library.

50.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NOR flash memories. It uses the FMC layer functions to interface with NOR devices. This driver is used as follows:

- NOR flash memory configuration sequence using the function HAL_NOR_Init() with control and timing parameters for both normal and extended mode.
- Read NOR flash memory manufacturer code and device IDs using the function HAL_NOR_Read_ID(). The read information is stored in the NOR_ID_TypeDef structure declared by the function caller.
- Access NOR flash memory by read/write data unit operations using the functions HAL_NOR_Read(), HAL_NOR_Program().
- Perform NOR flash erase block/chip operations using the functions HAL_NOR_Erase_Block() and HAL_NOR_Erase_Chip().
- Read the NOR flash CFI (common flash interface) IDs using the function HAL_NOR_Read_CFI(). The read information is stored in the NOR_CFI_TypeDef structure declared by the function caller.
- You can also control the NOR device by calling the control APIs HAL_NOR_WriteOperation_Enable()/ HAL_NOR_WriteOperation_Disable() to respectively enable/disable the NOR write operation
- You can monitor the NOR device HAL state by calling the function HAL_NOR_GetState()

Note: This driver is a set of generic APIs which handle standard NOR flash operations. If a NOR flash device contains different operations and/or implementations, it should be implemented separately.

NOR HAL driver macros list

Below the list of most used macros in NOR HAL driver.

- NOR_WRITE : NOR memory write data to specified address

Callback registration

The compilation define USE_HAL_NOR_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NOR_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NOR MspInit.
- MspDeInitCallback : NOR MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NOR_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- MspInitCallback : NOR MspInit.

- MspDeInitCallback : NOR MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NOR_Init and if the state is HAL_NOR_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_NOR_Init and HAL_NOR_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NOR_Init and HAL_NOR_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NOR_RegisterCallback before calling HAL_NOR_DeInit or HAL_NOR_Init function. When The compilation define USE_HAL_NOR_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

51.2 PCD Firmware driver API description

The following section lists the various functions of the PCD library.

51.2.1 How to use this driver

The PCD HAL driver can be used as follows:

1. Declare a PCD_HandleTypeDef handle structure, for example: PCD_HandleTypeDef hpcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_PCD_Init() API to initialize the PCD peripheral (Core, Device core, ...)
4. Initialize the PCD low level resources through the HAL_PCD_MspInit() API:
   a. Enable the PCD/USB Low Level interface clock using
      - __HAL_RCC_USB_OTG_FS_CLK_ENABLE();
      - __HAL_RCC_USB_OTG_HS_CLK_ENABLE(); (For High Speed Mode)
   b. Initialize the related GPIO clocks
   c. Configure PCD pin-out
   d. Configure PCD NVIC interrupt
5. Associate the Upper USB device stack to the HAL PCD Driver:
   a. hpcd.pData = pdev;
6. Enable PCD transmission and reception:
   a. HAL_PCD_Start();

53.2 PSSI Firmware driver API description

The following section lists the various functions of the PSSI library.

53.2.1 How to use this driver

The PSSI HAL driver can be used as follows:

1. Declare a PSSI_HandleTypeDef handle structure, for example: PSSI_HandleTypeDef hpssi;
2. Initialize the PSSI low level resources by implementing the HAL_PSSI_MspInit() API:
   a. Enable the PSSIx interface clock
   b. PSSI pins configuration
      - Enable the clock for the PSSI GPIOs
      - Configure PSSI pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the PSSIx interrupt priority
      - Enable the NVIC PSSI IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare DMA_HandleTypeDef handles structure for the transmit and receive
      - Enable the DMAx interface clock
      - Configure the DMA handle parameters
      - Configure the DMA Tx and Rx
      - Associate the initialized DMA handle to the hpssi DMA Tx and Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx and Rx
3. Configure the Communication Bus Width, Control Signals, Input Polarity and Output Polarity in the hpssi Init structure.
4. Initialize the PSSI registers by calling HAL_PSSI_Init(), configure also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL_PSSI_MspInit(&hpssi) API.
5. Configure the PSSI clock as internal or external by calling HAL_PSSI_ClockConfig().
6. For PSSI IO operations, two operation modes are available within this driver :

Polling mode IO operation

- Transmit an amount of data by byte in blocking mode using HAL_PSSI_Transmit()
- Receive an amount of data by byte in blocking mode using HAL_PSSI_Receive()

DMA mode IO operation

- Transmit an amount of data in non-blocking mode (DMA) using HAL_PSSI_Transmit_DMA()
- At transmission end of transfer, HAL_PSSI_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_PSSI_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL_PSSI_Receive_DMA()
- At reception end of transfer, HAL_PSSI_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_PSSI_RxCpltCallback()
- In case of transfer Error, HAL_PSSI_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_PSSI_ErrorCallback()
- Abort a PSSI process communication with Interrupt using HAL_PSSI_Abort_IT()
- End of abort process, HAL_PSSI_AbortCpltCallback() is executed and user can add his own code by customization of function pointer HAL_PSSI_AbortCpltCallback()

PSSI HAL driver macros list

Below the list of most used macros in PSSI HAL driver.

- HAL_PSSI_ENABLE : Enable the PSSI peripheral
- HAL_PSSI_DISABLE : Disable the PSSI peripheral
- HAL_PSSI_GET_FLAG : Check whether the specified PSSI flag is set or not
- HAL_PSSI_CLEAR_FLAG : Clear the specified PSSI pending flag
- HAL_PSSI_ENABLE_IT : Enable the specified PSSI interrupt
- HAL_PSSI_DISABLE_IT : Disable the specified PSSI interrupt

Callback registration

Note: You can refer to the PSSI HAL driver header file for more useful macros

53.2.2 Detailed description of functions

HAL_PSSI_Init

HAL_PSSI_ERROR_INVALID_CALLBACK

Invalid callback error

PSSI Exported Macros

HAL_PSSI_RESET_HANDLE_STATE

Description:

- Reset PSSI handle state.

Parameters:

- __HANDLE__: specifies the PSSI handle.

Return value:

- None

HAL_PSSI_ENABLE

Description:

- Enable the PSSI.

Parameters:

- __HANDLE__: PSSI handle

Return value:

- None.

HAL_PSSI_DISABLE

Description:

- Disable the PSSI.

Parameters:

- __HANDLE__: PSSI handle

Return value:

- None.

HAL_PSSI_GET_STATUS

Description:

- Get the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - PSSI_FLAG_RTT1B: FIFO is ready to transfer one byte
  - PSSI_FLAG_RTT4B: FIFO is ready to transfer four bytes

Return value:

- The: state of FLAG.

HAL_PSSI_GET_FLAG

Description:

- Get the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:

- The: state of FLAG.

HAL_PSSI_CLEAR_FLAG

Description:

- Clear the PSSI pending flags.

Parameters:

- __HANDLE__: PSSI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:

- None

HAL_PSSI_ENABLE_IT

Description:

- Enable the specified PSSI interrupts.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Configuration error mask

Return value:

- None

HAL_PSSI_DISABLE_IT

Description:

- Disable the specified PSSI interrupts.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be disabled. This parameter can be any combination of the following values:
  - PSSI_IT_OVR_IE: Configuration error mask

Return value:

- None

HAL_PSSI_GET_IT_SOURCE

Description:

- Check whether the specified PSSI interrupt source is enabled or not.

Parameters:

- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt source to check. This parameter can be one of the following values:
  - PSSI_IT_OVR_IE: Data Buffer overrun/underrun error interrupt mask

Return value:

- The: state of INTERRUPT source.

IS_PSSI_CONTROL_SIGNAL

Description:

- Check whether the PSSI Control signal is valid.

Parameters:

- __CONTROL__: Control signals configuration

Return value:

- Valid: or not.

IS_PSSI_BUSWIDTH

Description:

- Check whether the PSSI Bus Width is valid.

Parameters:

- __BUSWIDTH__: PSSI Bush width

Return value:

- Valid: or not.

IS_PSSI_CLOCK_POLARITY

Description:

- Check whether the PSSI Clock Polarity is valid.

Parameters:

- __CLOCKPOL__: PSSI Clock Polarity

Return value:

- Valid: or not.

IS_PSSI_DE_POLARITY

Description:

- Check whether the PSSI Data Enable Polarity is valid.

Parameters:

- __DEPOL__: PSSI DE Polarity

Return value:

- Valid: or not.

IS_PSSI_RDY_POLARITY

Description:

- Check whether the PSSI Ready Polarity is valid.

Parameters:

- __RDYPOL__: PSSI RDY Polarity

Return value:

- Valid: or not.

IS_PSSI_CLOCK_SOURCE

Description:

- Check whether the PSSI Clock source is valid.

Parameters:

- __CLOCKSRC__: PSSI Clock Source

Return value:

- Valid: or not.

PSSI Interrupts

PSSI_FLAG_OVR_RIS

Overrun, Underrun errors flag

PSSI_FLAG_MASK

Overrun, Underrun errors Mask

PSSI_FLAG_OVR_MIS

Overrun, Underrun masked errors flag

PSSI mode

HAL_PSSI_UNIDIRECTIONAL

Uni-directional mode

HAL_PSSI_BIDIRECTIONAL

Bi-directional mode

54 HAL PWR Generic Driver

54.1 PWR Firmware driver registers structures

54.1.1 PWR_PVDTypeDef

PWR_PVDTypeDef is defined in the stm32n6xx_hal_pwr.h

Data Fields

- ***uint32_t Mode***

Field Documentation

- ***uint32_t PWR_PVDTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***PWR_PVD_Mode***.

54.2 PWR Firmware driver API description

The following section lists the various functions of the PWR library.

54.2.1 PWR peripheral overview

1. The Power control (PWR) provides an overview of the supply architecture for the different power domains and of the supply configuration controller.
2. Several low-power modes are available to save power when the CPU does not need to execute code :
   – Sleep (CPU clock stopped and still in RUN mode)
   – Stop (System clock stopped)
   – Standby (System powered down)

54.2.2 How to use this driver

1. Call HAL_PWR_EnableBkUpAccess() and HAL_PWR_DisableBkUpAccess() functions to enable/disable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).
2. Call HAL_PWR_ConfigPVD() after setting parameters to be configured (event mode and voltage threshold) in order to set up the Programmed Voltage Detector, then use HAL_PWR_EnablePVD() and HAL_PWR_DisablePVD() functions to start and stop the PVD detection.
   – PVD level on PVD_IN is compared to the internal VREFINT level. PVDO flag is available in PWR_CR2 to indicate if the voltage level on PVD_IN is higher or lower than the PVD threshold.
3. Call HAL_PWR_EnableWakeUpPin() and HAL_PWR_DisableWakeUpPin() functions with the right parameter to configure the wake up pin polarity (Low or High), the wake up pin selection and to enable and disable it.
4. Call HAL_PWREx_GetWakeupFlag() and HAL_PWREx_ClearWakeupFlag() functions to manage wake-up flag for the selected pin.
5. Call HAL_PWR_EnterSLEEPMode() function to enter the CPU in Sleep mode. Wake-up from Sleep mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()).
6. Call HAL_PWR_EnterSTOPMode() function to enter the whole system to Stop mode. Wake-up from Stop mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on STM32N6 devices is managed internally but regulator parameter is kept for product compatibility).
7. Call HAL_PWR_EnterSTANDBYMode() function to enter the whole system in Standby mode. Wake-up from Standby mode can be following only by an interrupt.
8. Call HAL_PWR_EnableSleepOnExit() and HAL_PWR_DisableSleepOnExit() APIs to enable and disable the Cortex-M55 re-entry in Sleep mode after an interruption handling is over.
9. Call HAL_PWR_EnableSEVOnPend() and HAL_PWR_DisableSEVOnPend() functions to configure the Cortex-M55 to wake-up after any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry.
10. Call HAL_PWR_WAKEUP_PIN_IRQHandler() function to handle all wake-up pins interrupts.

11. Call HAL_PWR_ConfigAttributes() function to configure PWR item secure and privilege attributes and call HAL_PWR_GetConfigAttributes() function to get the attribute configuration for the selected item.

PWR HAL driver macros list

Below the list of most used macros in PWR HAL driver.

- __HAL_PWR_GET_FLAG() : Get the PWR pending flags.
- __HAL_PWR_CLEAR_FLAG() : Clear the PWR pending flags.

54.2.3 Initialization and De-Initialization Functions

This section provides functions allowing to deinitialize power peripheral.

After system reset, the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM) is protected against possible unwanted write accesses. The HAL_PWR_EnableBkUpAccess() function enables the access to the backup domain. The HAL_PWR_DisableBkUpAccess() function disables the access to the backup domain.

This section contains the following APIs:

- ***HAL_PWR_DeInit()***
- ***HAL_PWR_EnableBkUpAccess()***
- ***HAL_PWR_DisableBkUpAccess()***

54.2.4 Peripheral Control Functions

This section provides functions allowing to control power peripheral.

PVD configuration

- The PVD is used to monitor the VDD power supply by comparing it to the internal VREFINT.
- A PVDO flag is available to indicate if VDD is higher or lower than the PVD threshold. This event is internally connected to the EXTI line 66 to generate an interrupt if enabled. It is configurable through __HAL_PWR_PVD_EXTI_ENABLE_IT() macro.
- The PVD is stopped in STANDBY mode.

Wake-up pin configuration

- Wake-up pin is used to wake up the system from STANDBY mode. The pin pull is configurable through the WKUPEPR register to be in No-pull, Pull-up and Pull-down. The pin polarity is configurable through the WKUPEPR register to be active on rising or falling edges.
- There are up to four Wake-up pin in the STM32N6 devices family.

Low Power modes configuration

The device present 3 principles low-power modes :

- SLEEP mode : Cortex-M55 is stopped and all PWR domains are remaining active (Powered and Clocked).
- STOP mode : Cortex-M55 is stopped, clocks are stopped and the regulator is running. The Main regulator or the LP regulator could be selected.
- STANDBY mode : All PWR domains enter DSTANDBY mode and the VCORE supply regulator is powered off.

SLEEP mode

- Entry: The SLEEP mode is entered by using the HAL_PWR_EnterSLEEPMode(Regulator, SLEEPEntry) function.
  - PWR_SLEEPENTRY_WFI: enter SLEEP mode with WFI instruction.
  - PWR_SLEEPENTRY_WFE: enter SLEEP mode with WFE instruction.
  - PWR_SLEEPENTRY_WFE_NO_EVT_CLEAR: enter SLEEP mode with WFE instruction and no clear of pending event.

Note: The Regulator parameter is not used for the STM32N6 family and is kept as parameter just to maintain compatibility with the lower power families.

- Exit: Any peripheral interrupt acknowledged by the nested vectored interrupt controller (NVIC) can wake up the device from SLEEP mode.

STOP mode

In system STOP mode, the CPU clock is stopped. All CPU subsystem peripheral clocks are stopped too. The voltage regulator can be configured either in normal or low-power mode. To minimize the consumption in STOP mode, FLASH can be powered off before entering the STOP mode using the HAL_PWREx_EnableFlashPowerDown() function. It can be switched on again by software after exiting the STOP mode using the HAL_PWREx_DisableFlashPowerDown() function.

- Entry: The STOP mode is entered using the HAL_PWR_EnterSTOPMode(Regulator, STOPEntry) function with:
  - Regulator:
    - PWR_MAINREGULATOR_ON: Main regulator ON. This parameter is not used for the STM32N6 family and is kept as parameter just to maintain compatibility with the lower power families.
  - STOPEntry:
    - PWR_STOPENTRY_WFI: enter STOP mode with WFI instruction.
    - PWR_STOPENTRY_WFE: enter STOP mode with WFE instruction.
    - PWR_STOPENTRY_WFE_NO_EVT_CLEAR: enter STOP mode with WFE instruction and no clear of pending event.
- Exit: Any EXTI Line (Internal or External) configured in Interrupt/Event mode.

STANDBY mode

- The system STANDBY mode allows to achieve the lowest power consumption. It is based on the Cortex-M55 deep SLEEP mode, with the voltage regulator disabled. The system is consequently powered off. The PLL, the HSI oscillator and the HSE oscillator are also switched off. SRAM and register contents are lost except for the RTC registers, RTC backup registers, backup SRAM and standby circuitry.
- The voltage regulator is OFF.
  - Entry:
    - The STANDBY mode is entered using the HAL_PWR_EnterSTANDBYMode() function.
  - Exit:
    - WKUP pin rising or falling edge, RTC alarm (Alarm A and Alarm B), RTC wakeup, tamper event, time stamp event, external reset in NRST pin, IWDG reset.

Auto-wakeup (AWU) from low-power mode

- The MCU can be woken up from low-power mode by an RTC Alarm event, an RTC Wakeup event, a tamper event or a time-stamp event, without depending on an external interrupt (Auto-wakeup mode).
- RTC auto-wakeup (AWU) from the STOP and STANDBY modes
  - To wake up from the STOP mode with an RTC alarm event, it is necessary to configure the RTC to generate the RTC alarm using the HAL_RTC_SetAlarm_IT() function.
  - To wake up from the STOP mode with an RTC Tamper or time stamp event, it is necessary to configure the RTC to detect the tamper or time stamp event using the HAL_RTCEx_SetTimeStamp_IT() or HAL_RTCEx_SetTamper_IT() functions.
  - To wake up from the STOP mode with an RTC WakeUp event, it is necessary to configure the RTC to generate the RTC WakeUp event using the HAL_RTCEx_SetWakeUpTimer_IT() function.

This section contains the following APIs:

- ***HAL_PWR_ConfigPVD()***
- ***HAL_PWR_EnablePVD()***
- ***HAL_PWR_DisablePVD()***
- ***HAL_PWR_EnableWakeUpPin()***
- ***HAL_PWR_DisableWakeUpPin()***
- ***HAL_PWR_GetWakeupFlag()***
- ***HAL_PWR_ClearWakeupFlag()***

- *HAL_PWR_WKUP4_Callback()*

54.2.5 PWR Attributes Functions

- The PWR is able to protect register bits from being modified by non-secure and unprivileged accesses. The protection can be activated for the following features through PWR_SECCFGR and PWR_PRIVCFGR:
  - System supply configuration.
  - Voltage scaling.
  - Low-power mode.
  - Wake-up (WKUP) pins.
  - Voltage detection and monitoring.
  - VBAT mode.
- A non-secure access to a secure-protected register bit is denied :
  - The secured bits are not written (WI) with a non-secure write access.
  - The secured bits are read as 0 (RAZ) with a non-secure read access.
- After any application reset or system reset, the PWR does not filter any access (default configuration: non-secure, any privileged) until the trusted agent has programmed the security and privileged protection.
- Secure/non-secure access filtering
- To enable the filtering access based on this attribute, the authorized master agent must set SECx in PWR_SECCFGR related to the PWR feature. When a register is configured as secure, read and write operations are only allowed by a secure access. Non-secure read or write accesses are denied (RAZ/WI). An illegal secure access event is generated to the IAC (illegal access controller). There is no bus error generated. When a register is configured as non-secure, read and write operations are allowed by both secure and non-secure accesses.
- Privileged/unprivileged access filtering
- To enable the filtering access based on this attribute, the authorized master agent has to set PRIVx in PWR_PRIVCFGR related to the PWR feature. When a register is configured as privileged, read and write operations are only allowed by a privileged access. Unprivileged read or write accesses are denied (RAZ/WI). An illegal privileged access event is generated to the IAC. There is no bus error generated. When a register is configured as unprivileged, read and write operations are allowed by both privileged and unprivileged accesses.

This section contains the following APIs:

- *HAL_PWR_ConfigAttributes()*
- *HAL_PWR_GetConfigAttributes()*

54.2.6 Detailed description of functions

HAL_PWR_DeInit

Function name

void HAL_PWR_DeInit (void)

Function description

Deinitialize the HAL PWR peripheral registers to their default reset values.

Return values

- **None.:**

Notes

- This functionality is not available in this product. The prototype is kept just to maintain compatibility with other products.

HAL_PWR_EnableBkUpAccess

Function name

void HAL_PWR_EnableBkUpAccess (void)

Function description

Enable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).

Return values

- **None.:**

Notes

- After a system reset, the backup domain is protected against possible unwanted write accesses.

HAL_PWR_DisableBkUpAccess

Function name

void HAL_PWR_DisableBkUpAccess (void)

Function description

Disable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).

Return values

- **None.:**

HAL_PWR_ConfigPVD

Function name

void HAL_PWR_ConfigPVD (const PWR_PVDTypeDef * pConfigPVD)

Function description

Configure the voltage threshold detected by the Programmed Voltage Detector (PVD).

Parameters

- **pConfigPVD:** : Pointer to a PWR_PVDTypeDef structure that contains the PVD configuration information (EventMode).

Return values

- **None.:**

HAL_PWR_EnablePVD

Function name

void HAL_PWR_EnablePVD (void)

Function description

Enable the programmable voltage detector (PVD).

Return values

- **None.:**

HAL_PWR_DisablePVD

Function name

void HAL_PWR_DisablePVD (void)

Function description

Disable the programmable voltage detector (PVD).

Return values

- **None.:**

HAL_PWR_EnableWakeUpPin

Function name

void HAL_PWR_EnableWakeUpPin (uint32_t WakeUpPinPolarity)

Function description

Enable the WakeUp PINx functionality.

Parameters

- **WakeUpPinPolarity:** : Specifies which Wake-Up pin to enable. This parameter can be one of the following legacy values, which sets the default (rising edge):
  - PWR_WAKEUP_PIN1, PWR_WAKEUP_PIN2, PWR_WAKEUP_PIN3, PWR_WAKEUP_PIN4. or one of the following values where the user can explicitly states the enabled pin and the chosen polarity:
  - PWR_WAKEUP_PIN1_HIGH, PWR_WAKEUP_PIN1_LOW, PWR_WAKEUP_PIN2_HIGH, PWR_WAKEUP_PIN2_LOW, PWR_WAKEUP_PIN3_HIGH, PWR_WAKEUP_PIN3_LOW, PWR_WAKEUP_PIN4_HIGH, PWR_WAKEUP_PIN4_LOW.

Return values

- **None.:**

Notes

- PWR_WAKEUP_PINx and PWR_WAKEUP_PINx_HIGH are equivalent.

HAL_PWR_DisableWakeUpPin

Function name

void HAL_PWR_DisableWakeUpPin (uint32_t WakeUpPinx)

Function description

Disable the WakeUp PINx functionality.

Parameters

- **WakeUpPinx:** : Specifies the Power Wake-Up pin to disable. This parameter can be one of the following values:
  - PWR_WAKEUP_PIN1, PWR_WAKEUP_PIN2, PWR_WAKEUP_PIN3, PWR_WAKEUP_PIN4, PWR_WAKEUP_PIN1_HIGH, PWR_WAKEUP_PIN1_LOW, PWR_WAKEUP_PIN2_HIGH, PWR_WAKEUP_PIN2_LOW, PWR_WAKEUP_PIN3_HIGH, PWR_WAKEUP_PIN3_LOW, PWR_WAKEUP_PIN4_HIGH, PWR_WAKEUP_PIN4_LOW.

Return values

- **None.:**

HAL_PWR_GetWakeupFlag

Function name

uint32_t HAL_PWR_GetWakeupFlag (uint32_t WakeUpFlag)

Function description

Get the Wake-Up Pin pending flags.

Parameters

- **WakeUpFlag:** : Specifies the Wake-Up PIN flag to be checked. This parameter can be one of the following values:
  - PWR_WAKEUP_FLAG1 : Get wakeup event received from PA0.
  - PWR_WAKEUP_FLAG2 : Get wakeup event received from PA2.
  - PWR_WAKEUP_FLAG3 : Get wakeup event received from PC13.
  - PWR_WAKEUP_FLAG4 : Get wakeup event received from PD2.
  - PWR_WAKEUP_FLAG_ALL : Get Wakeup event received from all wake up pins.

Return values

- **The:** Wake-Up pin flag.

HAL_PWR_ClearWakeupFlag

Function name

HAL_StatusTypeDef HAL_PWR_ClearWakeupFlag (uint32_t WakeUpFlag)

Function description

Clear the Wake-Up pin pending flag.

Parameters

- **WakeUpFlag:** Specifies the Wake-Up PIN flag to clear. This parameter can be one of the following values:
  - PWR_WAKEUP_FLAG1 : Clear the wakeup event received from PA0.
  - PWR_WAKEUP_FLAG2 : Clear the wakeup event received from PA2.
  - PWR_WAKEUP_FLAG3 : Clear the wakeup event received from PC13.
  - PWR_WAKEUP_FLAG4 : Clear the wakeup event received from PD2.
  - PWR_WAKEUP_FLAG_ALL : Clear the wakeup events received from all wake up pins.

Return values

- **HAL:** status.

HAL_PWR_EnterSTOPMode

Function name

void HAL_PWR_EnterSTOPMode (uint32_t Regulator, uint8_t STOPEntry)

Function description

Enter the whole system to Stop mode.

Parameters

- **Regulator:** : This parameter is not used for this product family. and is kept as parameter just to maintain compatibility with the lower power families.
- **STOPEntry:** : Specifies if STOP mode in entered with WFI or WFE intrinsic instruction. This parameter can be one of the following values:
  - PWR_STOPENTRY_WFI : Enter STOP mode with WFI instruction.
  - PWR_STOPENTRY_WFE : Enter STOP mode with WFE instruction.
  - PWR_STOPENTRY_WFE_NO_EVT_CLEAR : Enter STOP mode with WFE and no clear of pending event before.

Return values

- **None.:**

Notes

- This API will enter the system in STOP mode
- In System STOP mode, all I/O pins keep the same state as in Run mode.
- When exiting System STOP mode by issuing an interrupt or a wakeup event, the HSI RC oscillator is selected as default system wakeup clock.
- In System STOP mode, when the voltage regulator operates in low power mode, an additional startup delay is incurred when the system is waking up. By keeping the internal regulator ON during STOP mode, the consumption is higher although the startup time is reduced.

HAL_PWR_EnterSLEEPMode

Function name

void HAL_PWR_EnterSLEEPMode (uint32_t Regulator, uint8_t SLEEPEntry)

Function description

Enter the current core in SLEEP mode (CSLEEP).

Parameters

- **Regulator:** : NA in this family project Specifies the regulator state in SLEEP mode.
- **SLEEPEntry:** : Specifies if SLEEP mode is entered with WFI or WFE intrinsic instruction. This parameter can be one of the following values:
  - PWR_SLEEPENTRY_WFI : Enter SLEEP mode with WFI instruction.
  - PWR_SLEEPENTRY_WFE : Enter SLEEP mode with WFE instruction.
  - PWR_SLEEPENTRY_WFE_NO_EVT_CLEAR: Enter SLEEP mode with WFE and no clear of pending event before.

Return values

- **None.:**

Notes

- This parameter is not used for the STM32N6 family and is kept as parameter just to maintain compatibility with the lower power families.
- Ensure to clear pending events before calling this API through HAL_PWREx_ClearPendingEvent() when the SLEEP entry is WFE.

HAL_PWR_EnterSTANDBYMode

Function name

void HAL_PWR_EnterSTANDBYMode (void)

Function description

Enter the whole system to Standby mode.

Return values

- **None.:**

Notes

- The Standby mode allows achieving the lowest power consumption.
- When the system enters in Standby mode, the voltage regulator is disabled. The complete VCORE domain is consequently powered off. The PLLs, HSI oscillator, CSI oscillator, HSI48 and the HSE oscillator are also switched off. SRAM and register contents are lost except for backup domain registers (RTC registers, RTC backup register and backup RAM), and Standby circuitry.
- When the System exit STANDBY mode by issuing an interrupt or a wakeup event, the HSI RC oscillator is selected as system clock.

HAL_PWR_EnableSleepOnExit

Function name

void HAL_PWR_EnableSleepOnExit (void)

Function description

Indicate SLEEP-ON-EXIT feature when returning from handler mode to thread mode.

Return values

- **None.:**

Notes

- Set SLEEPONEXIT bit of SCR register. When this bit is set, the processor re-enters Sleep mode when an interruption handling is over. Setting this bit is useful when the processor is expected to run only on interruptions handling.

HAL_PWR_DisableSleepOnExit

Function name

void HAL_PWR_DisableSleepOnExit (void)

Function description

Disable SLEEP-ON-EXIT feature when returning from handler mode to thread mode.

Return values

- **None.:**

Notes

- Clears SLEEPONEXIT bit of SCR register. When this bit is set, the processor re-enters Sleep mode when an interruption handling is over.

HAL_PWR_EnableSEVOnPend

Function name

void HAL_PWR_EnableSEVOnPend (void)

Function description

Enable CORTEX SEV-ON-PEND feature.

Return values

- **None.:**

Notes

- Sets SEVONPEND bit of SCR register. When this bit is set, any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry wakes up the Cortex-M55.

HAL_PWR_DisableSEVOnPend

Function name

void HAL_PWR_DisableSEVOnPend (void)

Function description

Disable CORTEX SEVONPEND feature.

Return values

- **None.:**

Notes

- Resets SEVONPEND bit of SCR register. When this bit is reset, only enabled pending causes exception entry wakes up the Cortex-M55.

HAL_PWR_PVD_Rising_Callback

Function name

void HAL_PWR_PVD_Rising_Callback (void)

Function description

PWR PVD interrupt Rising callback.

Return values

- **None:**

HAL_PWR_PVD_Falling_Callback

Function name

void HAL_PWR_PVD_Falling_Callback (void)

Function description

PWR PVD interrupt Falling callback.

Return values

- **None:**

HAL_PWR_WAKEUP_PIN_IRQHandler

Function name

void HAL_PWR_WAKEUP_PIN_IRQHandler (void)

Function description

This function handles the PWR WAKEUP PIN interrupt request.

Return values

- **None.:**

Notes

- This API should be called under the WAKEUP_PIN_IRQHandler().

HAL_PWR_WKUP1_Callback

Function name

void HAL_PWR_WKUP1_Callback (void)

Function description

PWR WKUP1 interrupt callback.

Return values

- **None.:**

HAL_PWR_WKUP2_Callback

Function name

void HAL_PWR_WKUP2_Callback (void)

Function description

PWR WKUP2 interrupt callback.

Return values

- **None.:**

HAL_PWR_WKUP3_Callback

Function name

void HAL_PWR_WKUP3_Callback (void)

Function description

PWR WKUP3 interrupt callback.

Return values

- **None.:**

HAL_PWR_WKUP4_Callback

Function name

void HAL_PWR_WKUP4_Callback (void)

Function description

PWR WKUP4 interrupt callback.

Return values

- **None.:**

HAL_PWR_ConfigAttributes

Function name

void HAL_PWR_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the PWR item attributes.

Parameters

- **Item:** : Specifies the item(s) to set attributes on. This parameter can be a combination of PWR_ITEMS.
- **Attributes:** : Specifies the available attribute(s). This parameter can be one of PWR_ATTRIBUTES.

Return values

- **None.:**

Notes

- Available attributes are security and privilege protection.
- Security attribute can only be set only by secure access.
- Privilege attribute for secure items can be managed only by a secure privileged access.
- Privilege attribute for nsecure items can be managed by a secure privileged access or by a nsecure privileged access.

HAL_PWR_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_PWR_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get attribute(s) of a PWR item.

Parameters

- **Item:** : Specifies the item(s) to get attributes on. This parameter can be one of PWR_ITEMS.
- **pAttributes:** : Pointer to return attribute(s). Returned value could be on of PWR_ATTRIBUTES.

Return values

- **HAL:** Status.

54.3 PWR Firmware driver defines

The following section lists the various define and macros of the module.

54.3.1 PWR

PWR

PWR Attributes

PWR_ITEM_ATTR_NSEC_PRIV_MASK

NSecure Privilege / NPrivilege attribute item mask

PWR_ITEM_ATTR_SEC_PRIV_MASK

Secure Privilege / NPrivilege attribute item mask

PWR_NSEC_PRIV

NSecure and Privileged attribute

PWR_NSEC_NPRIV

NSecure and NPrivileged attribute

PWR_SEC_PRIV

Secure and Privileged attribute

PWR_SEC_NPRIV

Secure and NPrivileged attribute

PWR Enable WUP Mask

PWR_EWUP_MASK

PWR Exported Macro

__HAL_PWR_GET_FLAG

Description:

- Check whether or not a specific PWR flag is set.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - PWR_FLAG_PVDO: This flag is valid only if PVD is enabled by the HAL_PWR_EnablePVD()function. The PVD is stopped by STANDBY mode.
  - PWR_FLAG_ACTVOSRDY: This flag indicates that the regulator voltage scaling output selection is ready.
  - PWR_FLAG_ACTVOS: This flag indicates that the regulator voltage scaling output selection is ready.
  - PWR_FLAG_VOSRDY When an internal regulator is used, this bit indicates that all the features allowed by the selected VOS can be used.
  - PWR_FLAG_VCOREH: This flag indicates if the VDDCORE level is above the high monitoring threshold.
  - PWR_FLAG_VCOREL This flag indicates if the VDDCORE level is above the low monitoring threshold.
  - PWR_FLAG_TEMPH: This flag indicates if the temperature level is above the high monitoring threshold.
  - PWR_FLAG_TEMPL This flag indicates if the temperature level is above the low monitoring threshold.
  - PWR_FLAG_VBATH: This flag indicates if the VBAT level is above the high monitoring threshold.
  - PWR_FLAG_VBATL: This flag indicates if the VBAT level is above the low monitoring threshold.
  - PWR_FLAG_SBF: Standby mode flag.
  - PWR_FLAG_STOPF: STOP mode flag.
  - PWR_FLAG_VDDIO5RDY: This flag indicates if the VDDIO5 is ready.
  - PWR_FLAG_VDDIO4RDY: This flag indicates if the VDDIO4 is ready.
  - PWR_FLAG_VDDIO3RDY: This flag indicates if the VDDIO3 is ready.
  - PWR_FLAG_VDDIO2RDY: This flag indicates if the VDDIO2 is ready.
  - PWR_FLAG_ARDY: This flag indicates if the VDDA18ADC is ready.
  - PWR_FLAG_USB33RDY: This flag indicates if the VDD33USB is ready.
  - PWR_FLAG_WUF1: This flag indicates a wakeup event was received from WKUP1 pin.
  - PWR_FLAG_WUF2: This flag indicates a wakeup event was received from WKUP2 pin.
  - PWR_FLAG_WUF3: This flag indicates a wakeup event was received from WKUP3 pin.
  - PWR_FLAG_WUF4: This flag indicates a wakeup event was received from WKUP4 pin.

Return value:

- The: (__FLAG__) state (TRUE or FALSE).

__HAL_PWR_CLEAR_FLAG

Description:

- Clear PWR flags.

Parameters:

- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - PWR_FLAG_STOPF : Stop flag. Indicates that the device was resumed from Stop mode.
  - PWR_FLAG_SBF : Standby flag. Indicates that the device was resumed from Standby mode.

Return value:

- None.

__HAL_PWR_GET_WAKEUPFLAG

Description:

- Check PWR wake up flags are set or not.

Parameters:

- __FLAG__: specifies the wake up flag to check. This parameter can be one of the following values:
  - PWR_FLAG_WKUP1 : This parameter gets Wake up line 1 flag.
  - PWR_FLAG_WKUP2 : This parameter gets Wake up line 2 flag.
  - PWR_FLAG_WKUP3 : This parameter gets Wake up line 3 flag.
  - PWR_FLAG_WKUP4 : This parameter gets Wake up line 4 flag.
  - PWR_FLAG_WKUP : This parameter gets Wake up lines 1 to 4 flags.

Return value:

- The: (__FLAG__) state (TRUE or FALSE).

__HAL_PWR_CLEAR_WAKEUPFLAG

Description:

- Clear CPU PWR wake up flags.

Parameters:

- __FLAG__: : Specifies the wake up flag to be cleared. This parameter can be one of the following values :
  - PWR_FLAG_WKUP1 : This parameter clears Wake up line 1 flag.
  - PWR_FLAG_WKUP2 : This parameter clears Wake up line 2 flag.
  - PWR_FLAG_WKUP3 : This parameter clears Wake up line 3 flag.
  - PWR_FLAG_WKUP4 : This parameter clears Wake up line 4 flag.
  - PWR_FLAG_WKUP : This parameter clears Wake up lines 1 to 4 flags.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_IT

Description:

- Enable the PVD Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_IT

Description:

- Disable the PVD Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_EVENT

Description:

- Enable the PVD Event Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_EVENT

Description:

- Disable the PVD Event Line.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_RISING_EDGE

Description:

- Enable the PVD Extended Interrupt Rising Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_RISING_EDGE

Description:

- Disable the PVD Extended Interrupt Rising Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_FALLING_EDGE

Description:

- Enable the PVD Extended Interrupt Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_FALLING_EDGE

Description:

- Disable the PVD Extended Interrupt Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- Enable the PVD Extended Interrupt Rising & Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_DISABLE_RISING_FALLING_EDGE

Description:

- Disable the PVD Extended Interrupt Rising & Falling Trigger.

Return value:

- None.

__HAL_PWR_PVD_EXTI_GET_RISING_FLAG

Description:

- Check whether or not the PVD EXTI interrupt Rising flag is set.

Return value:

- EXTI: PVD Line Status.

__HAL_PWR_PVD_EXTI_GET_FALLING_FLAG

Description:

- Check whether or not the PVD EXTI interrupt Falling flag is set.

Return value:

- EXTI: PVD Line Status.

__HAL_PWR_PVD_EXTI_CLEAR_RISING_FLAG

Description:

- Clear the PVD EXTI interrupt Rising flag.

Return value:

- None

__HAL_PWR_PVD_EXTI_CLEAR_FALLING_FLAG

Description:

- Clear the PVD EXTI interrupt Falling flag.

Return value:

- None

__HAL_PWR_PVD_EXTI_GENERATE_SWIT

Description:

- Generates a Software interrupt on PVD EXTI line.

Return value:

- None.

PWR Status Flags

PWR_FLAG_PVDO

Programmable voltage detect output

PWR_FLAG_ACTVOSRDY

Voltage levels ready bit

PWR_FLAG_ACTVOS

Programmable voltage detect output

PWR_FLAG_VOSRDY

- ***void(* __RAMCFG_HandleTypeDef::DetectDoubleErrorCallback)(struct __RAMCFG_HandleTypeDef *hramcfg)***
  RAMCFG Double Error Detect Callback

55.2 RAMCFG Firmware driver API description

The following section lists the various functions of the RAMCFG library.

55.2.1 How to use this driver

- Each SRAM is managed by a RAMCFG instance (AHBSRAM1/2, AXISRAM1 to 6, BKPSRAM, FLEXRAM, and VENCRAM).
- Each SRAM can be erased independently through its RAMCFG instance.
- AXISRAM 1 to 6 are the main SRAMs. AHBSRAM1/2 are preferably for DMA-controlled peripheral-to-memory data flow. AXISRAM 2 to 6 can be shut down when the application is in Run mode.
- FLEXMEM can be either allocated as Cortex-M55 TCM, or as system RAM (FLEXRAM). 80 Kbytes of the FLEXMEM are retained in Standby mode, either allocated as extended ITCM (64 +16-Kbyte ECC), or allocated as FLEXRAM.
- The BKPSRAM content is retained in low-power modes, even when VDD is off in VBAT mode. On a tamper event detection, the BKPSRAM content is erased.
- The VENCRAM implements hardware and software erases.

- FLEXRAM and BKPRAM support ECC correction feature:
  - Single error detection and correction with interrupt generation.
  - Double error detection with interrupt generation.
  - Status with failing address
- Call HAL_RAMCFG_Init() to initialize the RAMCFG peripheral before using any feature. Call HAL_RAMCFG_DeInit() to de-initialize the RAMCFG when using this peripheral is no more needed or a hardware issue has occurred.
  - HAL_RAMCFG_Init() and HAL_RAMCFG_DeInit() APIs do not change the activation status of ECC feature. It is managed by HAL_RAMCFG_StartECC(), HAL_RAMCFG_StopECC() or option bytes (When available on the device).

ECC feature

- Call HAL_RAMCFG_StartECC() and HAL_RAMCFG_StopECC() to enable and disable ECC hardware mechanism.
  - When ECC feature is previously enabled (case of option byte activation), calling HAL_RAMCFG_StartECC() is recommended to enable the ECC address latching feature.
- Call HAL_RAMCFG_EnableNotification() and HAL_RAMCFG_DisableNotification() to enable and disable ECC interrupts. Interrupts can be:
  - Single error interrupt.
  - Double error interrupt.
  - Double error interrupt redirected to Non maskable interrupt (NMI).
- Call HAL_RAMCFG_GetSingleErrorAddress() to get the address of the last fail RAM word detected (only for single error) and call HAL_RAMCFG_GetDoubleErrorAddress() to get the address of the last fail RAM word detected (only for double error).
- Call HAL_RAMCFG_IsECCSingleErrorDetected() to check if an ECC single error was detected. Call HAL_RAMCFG_IsECCDoubleErrorDetected() to check if an ECC double error was detected. These APIs are used in silent mode (No ECC interrupt is enabled).

Erase feature

- Call HAL_RAMCFG_Erase() to launch a hardware erase for the given SRAM.
- The erase value is equal to 0 when launching erase hardware through RAMCFG.
- SRAM2 write protected pages are erased when performing an erase through RAMCFG.

RAMCFG HAL driver macros list

Below the list of used macros in RAMCFG HAL driver.

- __HAL_RAMCFG_ENABLE_IT : Enable the specified RAMCFG interrupts.
- __HAL_RAMCFG_DISABLE_IT : Disable the specified RAMCFG interrupts.
- __HAL_RAMCFG_GET_FLAG : Get the RAMCFG pending flags.
- __HAL_RAMCFG_CLEAR_FLAG : Clear the RAMCFG pending flags.
- __HAL_RAMCFG_GET_IT_SOURCE : Check whether the specified RAMCFG interrupt source is enabled or not.

55.3 RAMCFG Firmware driver defines

The following section lists the various define and macros of the module.

55.3.1 RAMCFG

RAMCFG

RAMCFG SRAM Power Down

RAMCFG_AXISRAM_POWERDOWN

AXISRAM power down

RAMCFG Error Codes

HAL_RAMCFG_ERROR_NONE

RAMCFG No Error

HAL_RAMCFG_ERROR_TIMEOUT

RAMCFG Timeout Error

HAL_RAMCFG_ERROR_BUSY

RAMCFG Busy Error

HAL_RAMCFG_ERROR_INVALID_CALLBACK

Invalid Callback error

RAMCFG Exported Macros

__HAL_RAMCFG_ENABLE_IT

Description:

- Enable the specified RAMCFG interrupts.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __INTERRUPT__: Specifies the RAMCFG interrupt sources to be enabled. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.
  - RAMCFG_IT_NMIERR : Double Error Interrupt redirection to NMI Mask.
  - RAMCFG_IT_ALL : All Interrupt Mask.

Return value:

- None

__HAL_RAMCFG_DISABLE_IT

Description:

- Disable the specified RAMCFG interrupts.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __INTERRUPT__: Specifies the RAMCFG interrupt sources to be disabled. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.

Return value:

- None

Notes:

- This macros is used only to disable RAMCFG_IT_SINGLEERR and RAMCFG_IT_DOUBLEERR interrupts. RAMCFG_IT_NMIERR interrupt can only be disabled by global peripheral reset or system reset.

__HAL_RAMCFG_GET_IT_SOURCE

Description:

- Check whether the specified RAMCFG interrupt source is enabled or not.

Parameters:

- __HANDLE__: : Specifies the RAMCFG Handle.
- __INTERRUPT__: : Specifies the RAMCFG interrupt source to check. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.
  - RAMCFG_IT_NMIERR : Double Error Interrupt Redirection to NMI Mask.

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

__HAL_RAMCFG_GET_FLAG

Description:

- Get the RAMCFG pending flags.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __FLAG__: : Specifies the flag to be checked. This parameter can be one of the following values:
  - RAMCFG_FLAG_SINGLEERR : Single Error Detected and Corrected Flag.
  - RAMCFG_FLAG_DOUBLEERR : Double Error Detected Flag.
  - RAMCFG_FLAG_SRAMBUSY : SRAM Busy Flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_RAMCFG_CLEAR_FLAG

Description:

- Clear the RAMCFG pending flags.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __FLAG__: : Specifies the flag to be cleared. This parameter can be any combination of the following values:
  - RAMCFG_FLAG_SINGLEERR : Single Error Detected and Corrected Flag.
  - RAMCFG_FLAG_DOUBLEERR : Double Error Detected Flag.

Return value:

- None.

__HAL_RAMCFG_RESET_HANDLE_STATE

Description:

- Reset the RAMCFG handle state.

Parameters:

- __HANDLE__: : Specifies the RAMCFG Handle.

Return value:

- None.

RAMCFG Monitor Flags

RAMCFG_FLAG_SINGLEERR

RAMCFG Single Error Detected and Corrected Flag

RAMCFG_FLAG_DOUBLEERR

RAMCFG Double Error Detected Flag

RAMCFG_FLAG_SRAMBUSY

RAMCFG SRAM busy Flag

RAMCFG_FLAGS_ALL

RAMCFG All Flags

RAMCFG Interrupts

RAMCFG_IT_SINGLEERR

RAMCFG Single Error Interrupt

RAMCFG_IT_DOUBLEERR

RAMCFG Double Error Interrupt

RAMCFG_IT_ALL

RAMCFG All RAMCFG interrupt

RAMCFG Keys

RAMCFG_ERASE_KEY1

RAMCFG launch Erase Key 1

RAMCFG_ERASE_KEY2

RAMCFG launch Erase Key 2

RAMCFG_ECC_KEY1

RAMCFG launch ECC Key 1

RAMCFG_ECC_KEY2

RAMCFG launch ECC Key 2

56 HAL RCC Generic Driver

56.1 RCC Firmware driver registers structures

56.1.1 RCC_PLLInitTypeDef

RCC_PLLInitTypeDef is defined in the stm32n6xx_hal_rcc.h

Data Fields

- ***uint32_t PLLState***
- ***uint32_t PLLSource***
- ***uint32_t PLLM***
- ***uint32_t PLLFractional***
- ***uint32_t PLLN***
- ***uint32_t PLLP1***
- ***uint32_t PLLP2***

Field Documentation

- ***uint32_t RCC_PLLInitTypeDef::PLLState***
  The new state of the PLL. This parameter can be a value of ***RCC_PLL_Config***
- ***uint32_t RCC_PLLInitTypeDef::PLLSource***
  PLL entry clock source. This parameter must be a value of ***RCC_PLL_Clock_Source***
- ***uint32_t RCC_PLLInitTypeDef::PLLM***
  Division factor M for PLL VCO input clock. This parameter must be a number between Min_Data = 1 and Max_Data = 63
- ***uint32_t RCC_PLLInitTypeDef::PLLFractional***
  Fractional part of he VCO mulliplication factor. This parameter must be a number between Min_Data = 0 and Max_Data = 0xFFFFFF
- ***uint32_t RCC_PLLInitTypeDef::PLLN***
  Multiplication factor N for PLL VCO output clock. In integer mode, this parameter must be a number between Min_Data = 10 and Max_Data = 2500. In fractional mode, this parameter must be a number between Min_Data = 20 and Max_Data = 500.
- ***uint32_t RCC_PLLInitTypeDef::PLLP1***
  Division factor P1 for system clock. This parameter must be a number between Min_Data = 1 and Max_Data = 7
- ***uint32_t RCC_PLLInitTypeDef::PLLP2***
  Division factor P2 for system clock. This parameter must be a number between Min_Data = 1 and Max_Data = 7

56.1.2 RCC_OscInitTypeDef

RCC_OscInitTypeDef is defined in the stm32n6xx_hal_rcc.h

Data Fields

- ***uint32_t OscillatorType***
- ***uint32_t HSEState***
- ***uint32_t LSEState***
- ***uint32_t HSIState***
- ***uint32_t HSIDiv***
- ***uint32_t HSICalibrationValue***
- ***uint32_t LSIState***
- ***uint32_t MSIState***
- ***uint32_t MSIFrequency***
- ***uint32_t MSICalibrationValue***
- ***RCC_PLLInitTypeDef PLL1***
- ***RCC_PLLInitTypeDef PLL2***

- ***RCC_PLLInitTypeDef PLL3***
- ***RCC_PLLInitTypeDef PLL4***

Field Documentation

- ***uint32_t RCC_OscInitTypeDef::OscillatorType***
  The oscillators to be configured. This parameter can be a value of ***RCC_Oscillator_Type***
- ***uint32_t RCC_OscInitTypeDef::HSEState***
  The new state of the HSE. This parameter can be a value of ***RCC_HSE_Config***
- ***uint32_t RCC_OscInitTypeDef::LSEState***
  The new state of the LSE. This parameter can be a value of ***RCC_LSE_Config***
- ***uint32_t RCC_OscInitTypeDef::HSIState***
  The new state of the HSI. This parameter can be a value of ***RCC_HSI_Config***
- ***uint32_t RCC_OscInitTypeDef::HSIDiv***
  The division factor of the HSI. This parameter can be a value of ***RCC_HSI_Div***
- ***uint32_t RCC_OscInitTypeDef::HSICalibrationValue***
  The calibration trimming value. This parameter must be a number between Min_Data = 0 and Max_Data = 127
- ***uint32_t RCC_OscInitTypeDef::LSIState***
  The new state of the LSI. This parameter can be a value of ***RCC_LSI_Config***
- ***uint32_t RCC_OscInitTypeDef::MSIState***
  The new state of the MSI. This parameter can be a value of ***RCC_MSI_Config***
- ***uint32_t RCC_OscInitTypeDef::MSIFrequency***
  The MSI frequency selection. This parameter can be a value of ***RCC_MSI_Frequency***
- ***uint32_t RCC_OscInitTypeDef::MSICalibrationValue***
  The calibration trimming value. This parameter must be a number between Min_Data = 0 and Max_Data = 31
- ***RCC_PLLInitTypeDef RCC_OscInitTypeDef::PLL1***
  PLL1 structure parameters
- ***RCC_PLLInitTypeDef RCC_OscInitTypeDef::PLL2***
  PLL2 structure parameters
- ***RCC_PLLInitTypeDef RCC_OscInitTypeDef::PLL3***
  PLL3 structure parameters
- ***RCC_PLLInitTypeDef RCC_OscInitTypeDef::PLL4***
  PLL4 structure parameters

56.1.3 RCC_ICInitTypeDef

RCC_ICInitTypeDef is defined in the stm32n6xx_hal_rcc.h

Data Fields

- ***uint32_t ClockSelection***
- ***uint32_t ClockDivider***

Field Documentation

- ***uint32_t RCC_ICInitTypeDef::ClockSelection***
  Specifies ICx clock source. This parameter can be a value of ***RCC_IC_Clock_Source***
- ***uint32_t RCC_ICInitTypeDef::ClockDivider***
  Specifies ICx clock divider. This parameter must be a number between Min_Data = 1 and Max_Data = 256

56.1.4 RCC_ClkInitTypeDef

RCC_ClkInitTypeDef is defined in the stm32n6xx_hal_rcc.h

Data Fields

- ***uint32_t ClockType***
- ***uint32_t CPUCLKSource***
- ***uint32_t SYSCLKSource***
- ***uint32_t AHBCLKDivider***
- ***uint32_t APB1CLKDivider***

- ***uint32_t APB2CLKDivider***
- ***uint32_t APB4CLKDivider***
- ***uint32_t APB5CLKDivider***
- ***RCC_ICInitTypeDef IC1Selection***
- ***RCC_ICInitTypeDef IC2Selection***
- ***RCC_ICInitTypeDef IC6Selection***
- ***RCC_ICInitTypeDef IC11Selection***

Field Documentation

- ***uint32_t RCC_ClkInitTypeDef::ClockType***
  The clock to be configured. This parameter can be a value of ***RCC_Clock_Type***
- ***uint32_t RCC_ClkInitTypeDef::CPUCLKSource***
  The clock source used as CPU clock (CPUCLK). This parameter can be a value of ***RCC_CPU_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::SYSCLKSource***
  The clock source used as system bus clock (SYSCLK). This parameter can be a value of ***RCC_System_Bus_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::AHBCLKDivider***
  The AHB clock divider for HCLK. This clock is derived from the system clock divided by the system clock divider. This parameter can be a value of ***RCC_HCLK_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB1CLKDivider***
  The APB1 clock divider for PCLK1. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB1_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB2CLKDivider***
  The APB2 clock divider for PCLK2. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB2_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB4CLKDivider***
  The APB4 clock divider for PCLK4. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB4_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB5CLKDivider***
  The APB5 clock divider for PCLK5. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB5_Clock_Source***
- ***RCC_ICInitTypeDef RCC_ClkInitTypeDef::IC1Selection***
  IC1 parameters. This parameter shall be used when IC1 is selected as CPU clock source (sysa_ck)
- ***RCC_ICInitTypeDef RCC_ClkInitTypeDef::IC2Selection***
  IC2 parameters. This parameter shall be used when IC2 is selected as system bus clock source (sysb_ck)
- ***RCC_ICInitTypeDef RCC_ClkInitTypeDef::IC6Selection***
  IC6 parameters. This parameter shall be used when IC6 is selected as system bus clock source (sysc_ck)
- ***RCC_ICInitTypeDef RCC_ClkInitTypeDef::IC11Selection***
  IC11 parameters. This parameter shall be used when IC11 is selected as system bus clock source (sysd_ck)

56.2 RCC Firmware driver API description

The following section lists the various functions of the RCC library.

56.2.1 RCC specific features

After reset the device is running from Internal High Speed oscillator (HSI 64MHz) and all peripherals are off except internal SRAM, BSEC, PWR, IAC, RIFSC, RISAF and JTAG

- There is no pre-scaler on High speed (AHB) and Low speed (APB) buses; all peripherals mapped on these buses are running at HSI speed.
- All GPIOs are in analog mode , except the JTAG pins which are assigned to be used for debug purpose.

Once the device started from reset, the user application has to:

- Configure the clock source to be used to drive the System clock (if the application needs higher frequency/ performance than HSI)
- Configure the CPU and System bus clock frequencies

- Configure the AHB and APB buses pre-scalers
- Enable the clock for the peripheral(s) to be used
- Configure the clock kernel source(s) for peripherals which clocks are not derived from the System clock

56.2.2 RCC Limitations

A delay between an RCC peripheral clock enable and the effective peripheral enabling should be taken into account in order to manage the peripheral read/write from/to registers.

- This delay depends on the peripheral mapping.
- If peripheral is mapped on AHB: the delay is 2 AHB clock cycle after the clock enable bit is set on the hardware register
- If peripheral is mapped on APB: the delay is 2 APB clock cycle after the clock enable bit is set on the hardware register

Implemented Workaround:

- For AHB & APB peripherals, a dummy read to the peripheral register has been inserted in each __HAL_RCC_PPP_CLK_ENABLE() macro.

Incorrect APB prescaler setting:

- As described in the product errata, after enabling the bus clock to the peripheral and changing the default APB prescaler setting, performing a configuration on the bus peripheral does not update the peripheral registers, resulting in unexpected behavior.

56.2.3 Initialization and de-initialization functions

This section provides functions allowing to configure the internal/external oscillators (HSE, HSI, LSE, MSI, LSI, PLL, CSS and MCO) and the CPU and System buses clocks (SYSCLK, AHB1, AHB2, AHB3, AHB4, AHB5, APB1, APB2, APB4 and APB5).

Internal/external clock and PLL configuration

1. HSI (high-speed internal), 64 MHz factory-trimmed RC used directly or through the PLL as System clock source.
2. MSI is a low-power RC oscillator which can be used directly as system clock, peripheral clock, or PLL input.But even with frequency calibration, is less accurate than an external crystal oscillator or ceramic resonator.
3. LSI (low-speed internal), 32 KHz low consumption RC used as IWDG and/or RTC clock source.
4. HSE (high-speed external), 4 to 48 MHz crystal oscillator used directly or through the PLL as System clock source. Can be used also as RTC clock source.
5. LSE (low-speed external), 32 KHz oscillator used as RTC clock source.
6. PLL , The RCC features three independent PLLs (clocked by HSI , HSE or MSI), featuring three different output clocks and able to work either in integer or Fractional mode.
   – A main PLL, PLL1, which is generally used to provide clocks to the CPU and to some peripherals via the ICx mux.
   – Two dedicated PLLs, PLL2 and PLL3, which are used to generate the kernel clock for peripherals.
7. HSE CSS (Clock security system), once enabled and if a HSE clock failure occurs (HSE used directly or through PLL as System clock source), the System clock is automatically switched to HSI and an interrupt is generated if enabled. The interrupt is linked to the Cortex-M NMI (Non-Maskable Interrupt) exception vector.
8. LSE CSS (Clock security system), once enabled and if a LSE clock failure occurs the LSE is no more provided to RTC, it allows to wake-up from standby mode and protect the backup registers and BKPSRAM via TAMP. The LSE CSS may be re-armed for further attempt(s) to use LSE.
9. MCO1 (micro controller clock output), used to output HSI, LSE, HSE, LSI, MSI, CPU (SYSA), IC5 mux or IC10 mux clock (through a configurable pre-scaler) on PA8 pin.
10. MCO2 (micro controller clock output), used to output HSI, LSE, HSE, LSI, MSI, System Bus (SYSB), IC15 mux or IC20 mux clock (through a configurable pre-scaler) on PC9 pin.

CPU, System bus, AHB and APB buses clocks configuration

1. Several clock sources can be used to drive independently the CPU (CPUCLK) and System bus clock (SYSCLK): HSI, MSI, HSE or ICx mux. The AHB clock (HCLK) is derived from System core clock through configurable pre-scaler and used to clock the CPU, memory and peripherals mapped on AHB and APB bus through configurable pre-scalers and used to clock the peripherals mapped on these buses. You can use "HAL_RCC_GetSysClockFreq()" function to retrieve system clock frequency.

Note: All the peripheral clocks are derived from the System bus clock (SYSCLK).

This section contains the following APIs:

- ***HAL_RCC_DeInit()***
- ***HAL_RCC_OscConfig()***
- ***HAL_RCC_ClockConfig()***

56.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the RCC Clocks frequencies.

This section contains the following APIs:

- ***HAL_RCC_MCOConfig()***
- ***HAL_RCC_EnableCSS()***
- ***HAL_RCC_GetCpuClockFreq()***
- ***HAL_RCC_GetSysClockFreq()***
- ***HAL_RCC_GetHCLKFreq()***
- ***HAL_RCC_GetPCLK1Freq()***
- ***HAL_RCC_GetPCLK2Freq()***
- ***HAL_RCC_GetPCLK4Freq()***
- ***HAL_RCC_GetPCLK5Freq()***
- ***HAL_RCC_GetOscConfig()***
- ***HAL_RCC_GetClockConfig()***
- ***HAL_RCC_NMI_IRQHandler()***
- ***HAL_RCC_CSSCallback()***

56.2.5 RCC attributes functions

This subsection provides a set of functions allowing to:

- Configure the RCC item(s) attribute(s).
- Get the attribute of an RCC item.

This section contains the following APIs:

- ***HAL_RCC_ConfigAttributes()***
- ***HAL_RCC_GetConfigAttributes()***

56.2.6 Detailed description of functions

HAL_RCC_DeInit

Function name

HAL_StatusTypeDef HAL_RCC_DeInit (void)

Function description

Resets the RCC clock configuration to the default reset state.

Return values

- **HAL:** status

Notes

- The default reset state of the clock configuration is given below: HSI ON and used as CPU and system clock sourceMSI and HSE OFFPLL1, PLL2, PLL3 and PLL4 bypassedAHB, APB Bus prescalers set to 1CSS, MCO1 and MCO2 OFFAll interrupts disabled
- This function doesn't modify the configuration of the Peripheral clocksMemory clocksMisc clocksLSI, LSE and RTC clocksICx selections and dividers

HAL_RCC_OscConfig

Function name

HAL_StatusTypeDef HAL_RCC_OscConfig (const RCC_OscInitTypeDef * pRCC_OscInitStruct)

Function description

Initializes the RCC Oscillators according to the specified parameters in the RCC_OscInitTypeDef.

Parameters

- **pRCC_OscInitStruct:** Pointer to an RCC_OscInitTypeDef structure that contains the configuration information for the RCC Oscillators.

Return values

- **HAL:** status

Notes

- LSE control requires that the backup domain shall be previously enabled with HAL_PWR_EnableBkUpAccess().
- The PLL is not disabled when used as system clock.
- Transitions LSE Bypass to LSE On and LSE On to LSE Bypass are not supported by this function. User should request a transition to LSE Off first and then LSE On or LSE Bypass.
- Transition HSE Bypass to HSE On and HSE On to HSE Bypass are not supported by this function. User should request a transition to HSE Off first and then HSE On or HSE Bypass.
- This function does not protect the MCOxSEL, the PERSEL and the PPPSEL glitch-free muxes (Mux selection cannot be changed if selected input clock is inactive).
- This function activates HSE but does not wait for the startup time defined in the datasheet. This must be ensured by the application when the HSE is selected as PLL source.

HAL_RCC_ClockConfig

Function name

HAL_StatusTypeDef HAL_RCC_ClockConfig (const RCC_ClkInitTypeDef * pRCC_ClkInitStruct)

Function description

Initializes the CPU, System AXI, AHB, APB buses clocks according to the specified parameters in the RCC_ClkInitStruct.

Parameters

- **pRCC_ClkInitStruct:** Pointer to an RCC_OscInitTypeDef structure that contains the configuration information for the RCC peripheral.

Return values

- **None:**

Notes

- The SystemCoreClock CMSIS variable is used to store System Core Clock Frequency and updated by HAL_InitTick() function called within this function.
- The HSI is used (enabled by hardware) as system clock source after start-up from Reset, wake-up from STOP (unless MSI is selected) and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the Clock Security System CSS is enabled).
- A switch from one clock source to another occurs only if the target clock source is ready (clock stable after start-up delay or PLL locked). If a clock source which is not yet ready is selected, the switch will occur when the clock source will be ready. You can use HAL_RCC_GetClockConfig() function to know which clock is currently used as system clock source.

HAL_RCC_MCOConfig

Function name

void HAL_RCC_MCOConfig (uint32_t RCC_MCOx, uint32_t RCC_MCOSource, uint32_t RCC_MCODiv)

Function description

Selects the clock source to output on MCO1 pin(PA8) or on MCO2 pin(PC9).

Parameters

- **RCC_MCOx:** specifies the output direction for the clock source. This parameter can be one of the following values:
  - RCC_MCO1 Clock source to output on MCO1 pin(PA8).
  - RCC_MCO2 Clock source to output on MCO2 pin(PC9).
- **RCC_MCOSource:** specifies the clock source to output. This parameter can be one of the following values:
  - RCC_MCO1SOURCE_LSI LSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_LSE LSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_MSI MSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_HSI HSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_HSE HSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_IC5 IC5 clock selected as MCO1 source
  - RCC_MCO1SOURCE_IC10 IC10 clock selected as MCO1 source
  - RCC_MCO1SOURCE_SYSA CPU clock (SYSA) selected as MCO1 source
  - RCC_MCO2SOURCE_LSI LSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_LSE LSE clock selected as MCO2 source
  - RCC_MCO2SOURCE_MSI MSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_HSI HSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_HSE HSE clock selected as MCO2 source
  - RCC_MCO2SOURCE_IC15 IC15 clock selected as MCO2 source
  - RCC_MCO2SOURCE_IC20 IC20 clock selected as MCO2 source
  - RCC_MCO2SOURCE_SYSB Bus clock (SYSB) selected as MCO2 source
- **RCC_MCODiv:** specifies the MCOx pre-scaler. This parameter can be one of the following values:
  - RCC_MCODIV_1 up to RCC_MCODIV_16 : divider applied to MCOx clock

Return values

- **None:**

Notes

- PWR VDDIO4 Input Independent I/O supply 4 shall be previously set up for PC9 with HAL_PWREx_EnableVddIO4()
- The MCO switch to the new clock source only occurs when the previous clock source is active (dynamic switch).

HAL_RCC_EnableCSS

Function name

void HAL_RCC_EnableCSS (void)

Function description

Enable the HSE Clock Security System.

Return values

- **None:**

Notes

- If a failure is detected on the HSE oscillator clock, this oscillator is automatically disabled and an interrupt is generated to inform the software about the failure (Clock Security System Interrupt, CSSI), allowing the MCU to perform rescue operations. The CSSI is linked to the Cortex-M NMI (Non-Mask-able Interrupt) exception vector.
- The HSE Clock Security System may be enabled even if the HSE is not enabled but will be activated when the HSE is enabled and ready.
- It is not possible to disable the HSE Clock Security System.

HAL_RCC_GetCpuClockFreq

Function name

uint32_t HAL_RCC_GetCpuClockFreq (void)

Function description

Returns the CPU clock (sysa_ck) frequency.

Return values

- **CPUCLK:** frequency

Notes

- The CPU clock frequency computed by this function may be not the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:
- If CPUCLK source is HSI, function returns values based on HSI_VALUE(**)
- If CPUCLK source is MSI, function returns values based on MSI_VALUE(*)
- If CPUCLK source is HSE, function returns values based on HSE_VALUE(***)
- If CPUCLK source is IC1, function returns values based on HSI_VALUE(*), MSI_VALUE(**) or HSE_VALUE(***) multiplied/divided by the PLL factors.
- (*) HSI_VALUE is a constant defined in stm32n6xx_hal_conf.h file (default value 64 MHz) but the real value may vary depending on the variations in voltage and temperature.
- (**) MSI_VALUE is a constant defined in stm32n6xx_hal_conf.h file (default value 4 MHz) but the real value may vary depending on the variations in voltage and temperature.
- (***) HSE_VALUE is a constant defined in stm32n6xx_hal_conf.h file (default value 25 MHz), user has to ensure that HSE_VALUE is same as the real frequency of the crystal used. Otherwise, this function may have wrong result.
- The result of this function could be not correct when using fractional value for HSE crystal.
- This function can be used by the user application to compute the baud rate for the communication peripherals or configure other parameters.
- Each time CPUCLK changes, this function must be called by the user application to update the CPUCLK value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetSysClockFreq

Function name

uint32_t HAL_RCC_GetSysClockFreq (void)

Function description

Returns the SYSCLK bus (sysb_ck) frequency.

Return values

- **SYSCLK:** frequency

Notes

- The system bus frequency computed by this function may be not the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:
- If SYSCLK source is HSI, function returns values based on HSI_VALUE(**)
- If SYSCLK source is MSI, function returns values based on MSI_VALUE(*)
- If SYSCLK source is HSE, function returns values based on HSE_VALUE(***)
- If SYSCLK source is IC2, function returns values based on HSI_VALUE(*), MSI_VALUE(**) or HSE_VALUE(***) multiplied/divided by the PLL factors.
- (*) HSI_VALUE is a constant defined in stm32n6xx_hal_conf.h file (default value 64 MHz) but the real value may vary depending on the variations in voltage and temperature.
- (**) MSI_VALUE is a constant defined in stm32n6xx_hal_conf.h file (default value 4 MHz) but the real value may vary depending on the variations in voltage and temperature.
- (***) HSE_VALUE is a constant defined in stm32n6xx_hal_conf.h file (default value 25 MHz), user has to ensure that HSE_VALUE is same as the real frequency of the crystal used. Otherwise, this function may have wrong result.
- The result of this function could be not correct when using fractional value for HSE crystal.
- This function can be used by the user application to compute the baud rate for the communication peripherals or configure other parameters.
- Each time SYSCLK changes, this function must be called by the user application to update the SYSCLK value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetHCLKFreq

Function name

uint32_t HAL_RCC_GetHCLKFreq (void)

Function description

Return the HCLK frequency.

Return values

- **HCLK:** frequency in Hz

HAL_RCC_GetPCLK1Freq

Function name

uint32_t HAL_RCC_GetPCLK1Freq (void)

Function description

Return the PCLK1 frequency.

Return values

- **PCLK1:** frequency in Hz

Notes

- Each time PCLK1 changes, this function must be called to update the right PCLK1 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetPCLK2Freq

Function name

uint32_t HAL_RCC_GetPCLK2Freq (void)

Function description

Return the PCLK2 frequency.

Return values

- **PCLK2:** frequency in Hz

Notes

- Each time PCLK2 changes, this function must be called to update the right PCLK2 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetPCLK4Freq

Function name

uint32_t HAL_RCC_GetPCLK4Freq (void)

Function description

Return the PCLK4 frequency.

Return values

- **PCLK4:** frequency in Hz

Notes

- Each time PCLK4 changes, this function must be called to update the right PCLK4 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetPCLK5Freq

Function name

uint32_t HAL_RCC_GetPCLK5Freq (void)

Function description

Return the PCLK5 frequency.

Return values

- **PCLK5:** frequency in Hz

Notes

- Each time PCLK5 changes, this function must be called to update the right PCLK5 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetOscConfig

Function name

void HAL_RCC_GetOscConfig (RCC_OscInitTypeDef * pRCC_OscInitStruct)

Function description

Get the oscillators status configuration in RCC_OscInitStruct according to the internal RCC configuration registers.

Parameters

- **pRCC_OscInitStruct:** Pointer to an RCC_OscInitTypeDef structure that will return the configuration.

Return values

- **None:**

HAL_RCC_GetClockConfig

Function name

void HAL_RCC_GetClockConfig (RCC_ClkInitTypeDef * pRCC_ClkInitStruct)

Function description

Get the clocks status configuration in RCC_ClkInitStruct according to the internal RCC configuration registers.

Parameters

- **pRCC_ClkInitStruct:** Pointer to an RCC_ClkInitTypeDef structure that will return the configuration.

Return values

- **None:**

HAL_RCC_NMI_IRQHandler

Function name

void HAL_RCC_NMI_IRQHandler (void)

Function description

This function handles the RCC HSE CSS interrupt request.

Return values

- **None:**

Notes

- This API should be called under the NMI_Handler().

HAL_RCC_CSSCallback

Function name

void HAL_RCC_CSSCallback (void)

Function description

RCC HSE Clock Security System interrupt callback.

Return values

- **none:**

HAL_RCC_ConfigAttributes

Function name

void HAL_RCC_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the RCC item(s) attribute(s).

Parameters

- **Item:** Item(s) to set attributes on. This parameter can be a one value or a combination of RCC items belonging to the same group of items (eg. RCC_ITEM_GROUP_OSC)
- **Attributes:** specifies the RCC secure/privilege/public attributes. This parameter can be a combination of RCC attributes

Return values

- **None:**

Notes

- Available attributes are to control the secure, privileged, public and lock access rights of items. Default access rights are non-secure, unprivileged, non-public and unlocked.
- Secure/non-secure, privileged/unprivileged and public/non-public attributes can be set and reset from the secure/privileged state only.
- Lock Item attribute can be set from the secure/privileged state only.

HAL_RCC_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_RCC_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get the attributes of an RCC item.

Parameters

- **Item:** A single item to get secure/non-secure, public/non-public, privilege/non-privilege and locked attributes from. This parameter can be a value of RCC_items.
- **pAttributes:** pointer to return the attributes (this is a combination of RCC attributes).

Return values

- **HAL:** Status.

Notes

- Secured items are available from non-secure state when set as public

Attribute Management

HAL_RCC_ATTRIBUTES_IS_SEC

Description:

- Check whether an item attribute is secured.

Parameters:

- __ATTRIBUTES__: specifies the item attributes This parameter is a combination of

Return value:

- 1: if the item attribute is secured, 0 otherwise.

HAL_RCC_ATTRIBUTES_IS_PRIV

Description:

- Check whether an item attribute is privileged.

Parameters:

- __ATTRIBUTES__: specifies the item attributes This parameter is a combination of

Return value:

- 1: if the item attribute is privileged, 0 otherwise.

HAL_RCC_ATTRIBUTES_IS_PUB

Description:

- Check whether an item attribute is public.

Parameters:

- __ATTRIBUTES__: specifies the item attributes This parameter is a combination of

Return value:

- 1: if the item attribute is public, 0 otherwise.

HAL_RCC_ATTRIBUTES_IS_LOCK

Description:

- Check whether an item attribute is locked.

Parameters:

- __ATTRIBUTES__: specifies the item attributes This parameter is a combination of

Return value:

- 1: if the item attribute is locked, 0 otherwise.

RCC Exported Macros

__HAL_RCC_HSI_CONFIG

Description:

- Macro to enable or disable the Internal High Speed oscillator (HSI).

Parameters:

- __STATE__: specifies the new state of the HSI. This parameter can be one of the following values:
  - RCC_HSI_OFF turn OFF the HSI oscillator
  - RCC_HSI_ON turn ON the HSI oscillator

Notes:

- After enabling the HSI, the application software should wait on HSIRDY flag to be set indicating that the HSI clock is stable and that HSI clock can be used to clock the PLL and/or system clock. HSI can not be stopped if it is used directly or through the PLL as system clock. In this case, you have to select another source of the system clock then stop the HSI. The HSI is stopped by hardware when entering STOP and STANDBY modes.
- When the HSI is stopped, HSIRDY flag goes low after 6 HSI oscillator clock cycles.

__HAL_RCC_HSI_DIVIDER_CONFIG

Description:

- Macro to configure the Internal High Speed oscillator (HSI) clock divider.

Parameters:

- __HSIDIV__: specifies the HSI division factor. This parameter can be one of the following values:
  - RCC_HSI_DIV1 Divide the HSI oscillator clock by 1 (default after reset)
  - RCC_HSI_DIV2 Divide the HSI oscillator clock by 2
  - RCC_HSI_DIV4 Divide the HSI oscillator clock by 4
  - RCC_HSI_DIV8 Divide the HSI oscillator clock by 8

__HAL_RCC_GET_HSI_DIVIDER

Description:

- Macro to get the HSI divider.

Return value:

- The: HSI divider. The returned value can be one of the following values: of the following:
  - RCC_HSI_DIV1 Divide the HSI oscillator clock by 1 (default after reset)
  - RCC_HSI_DIV2 Divide the HSI oscillator clock by 2
  - RCC_HSI_DIV4 Divide the HSI oscillator clock by 4
  - RCC_HSI_DIV8 Divide the HSI oscillator clock by 8

__HAL_RCC_HSI_ENABLE

Notes:

- The HSI is stopped by hardware when entering STOP and STANDBY modes. It is used (enabled by hardware) as system clock source after start-up from Reset, wakeup from STOP and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the Clock Security System CSS is enabled). HSI can not be stopped if it is used as system clock source. In this case, you have to select another source of the system clock then stop the HSI. After enabling the HSI, the application software should wait on HSIRDY flag to be set indicating that HSI clock is stable and can be used as system clock source. When the HSI is stopped, HSIRDY flag goes low after 6 HSI oscillator clock cycles.

__HAL_RCC_HSI_DISABLE

__HAL_RCC_HSI_CALIBRATIONVALUE_ADJUST

Description:

- Macro to adjust the Internal High Speed 64MHz oscillator (HSI) calibration value.

Parameters:

- __HSICALIBRATIONVALUE__: specifies the calibration trimming value (default is RCC_HSICALIBRATION_DEFAULT). This parameter must be a number between 0 and 127.

Return value:

- None

Notes:

- The calibration is used to compensate for the variations in voltage and temperature that influence the frequency of the internal HSI RC.

__HAL_RCC_HSISTOP_ENABLE

Description:

- Macros to enable or disable the force of the Internal High Speed oscillator (HSI) in STOP mode to be quickly available as kernel clock for some peripherals.

Return value:

- None

Notes:

- Keeping the HSI ON in STOP mode allows to avoid slowing down the communication speed because of the HSI start-up time. The enable of this function has not effect on the HSION bit. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_HSISTOP_DISABLE

__HAL_RCC_MSI_ENABLE

Notes:

- The MSI is stopped by hardware when entering STOP and STANDBY modes. It is used (enabled by hardware) as system clock source after start-up from Reset, wakeup from STOP and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the Clock Security System CSS is enabled). MSI can not be stopped if it is used as system clock source. In this case, you have to select another source of the system clock then stop the MSI. After enabling the MSI, the application software should wait on MSIRDY flag to be set indicating that MSI clock is stable and can be used as system clock source. When the MSI is stopped, MSIRDY flag goes low after 6 MSI oscillator clock cycles.

__HAL_RCC_MSI_DISABLE

__HAL_RCC_MSI_FREQUENCY_CONFIG

Description:

- Macro to configure the Internal oscillator (MSI) frequency.

Parameters:

- __FREQ__: specifies the MSI frequency. This parameter can be one of the following values:
  - RCC_MSI_FREQ_4MHZ 4MHz selection (default after reset)
  - RCC_MSI_FREQ_16MHZ 16MHz selection

__HAL_RCC_MSI_CALIBRATIONVALUE_ADJUST

Description:

- Macro to adjust the Internal oscillator (MSI) calibration value.

Parameters:

- __MSICALIBRATIONVALUE__: specifies the calibration trimming value (default is RCC_MSICALIBRATION_DEFAULT). This parameter must be a number between 0 and 0x1F.

Return value:

- None

Notes:

- The calibration is used to compensate for the variations in voltage and temperature that influence the frequency of the internal MSI RC.

__HAL_RCC_MSISTOP_ENABLE

Description:

- Macros to enable or disable the force of the Low-power Internal oscillator (MSI) in STOP mode to be quickly available as kernel clock for USARTs and I2Cs.

Return value:

- None

Notes:

- Keeping the MSI ON in STOP mode allows to avoid slowing down the communication speed because of the MSI start-up time. The enable of this function has not effect on the MSION bit. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_MSISTOP_DISABLE

__HAL_RCC_LSI_ENABLE

Notes:

- After enabling the LSI, the application software should wait on LSIRDY flag to be set indicating that LSI clock is stable and can be used to clock the IWDG and/or the RTC. LSI can not be disabled if the IWDG is running. When the LSI is stopped, LSIRDY flag goes low after 6 LSI oscillator clock cycles.

__HAL_RCC_LSI_DISABLE

__HAL_RCC_HSE_CONFIG

Description:

- Macros to configure the External High Speed oscillator (HSE).

Parameters:

- __STATE__: specifies the new state of the HSE. This parameter can be one of the following values:
  - RCC_HSE_OFF turn OFF the HSE oscillator, HSERDY flag goes low after 6 HSE oscillator clock cycles.
  - RCC_HSE_ON turn ON the HSE oscillator.
  - RCC_HSE_BYPASS HSE oscillator bypassed with external clock (analog).
  - RCC_HSE_BYPASS_DIGITAL HSE oscillator bypassed with external digital clock.

Notes:

- After enabling the HSE (RCC_HSE_ON or RCC_HSE_BYPASS or RCC_HSE_BYPASS_DIGITAL), the application software should wait on HSERDY flag to be set indicating that HSE clock is stable and can be used to clock the PLL and/or system clock and peripheral kernel clock source. HSE state can not be changed if it is used directly or through the PLL as system clock. In this case, you have to select another source of the system clock then change the HSE state (ex. disable it). The HSE is stopped by hardware when entering STOP and STANDBY modes.

__HAL_RCC_LSE_CONFIG

Description:

- Macros to configure the External Low Speed oscillator (LSE).

Parameters:

- __STATE__: specifies the new state of the LSE. This parameter can be one of the following values:
  - RCC_LSE_OFF turn OFF the LSE oscillator, LSERDY flag goes low after 6 LSE oscillator clock cycles.
  - RCC_LSE_ON turn ON the LSE oscillator.
  - RCC_LSE_BYPASS LSE oscillator bypassed with external clock (analog).
  - RCC_LSE_BYPASS_DIGITAL LSE oscillator bypassed with external digital clock.

Notes:

- Transition LSE Bypass to LSE On and LSE On to LSE Bypass are not supported by this macro. User should request a transition to LSE Off first and then LSE On or LSE Bypass. The external input clock can have a frequency up to 1 MHz and be low swing (analog) or digital(*). A duty cycle close to 50% is recommended. As the LSE is in the Backup domain and write access is denied to this domain after reset, you have to enable write access using HAL_PWR_EnableBkUpAccess() function before to configure the LSE (to be done once after reset). After enabling the LSE (RCC_LSE_ON, RCC_LSE_BYPASS or RCC_LSE_BYPASS_DIGITAL), the application software should wait on LSERDY flag to be set indicating that LSE clock is stable and can be used to clock the RTC. If the RTC is used, the LSE bypass must not be configured in digital mode but in low swing analog mode (*)

__HAL_RCC_RTC_ENABLE

Notes:

- These macros must be used only after the RTC clock source was selected.

__HAL_RCC_RTC_DISABLE

__HAL_RCC_RTC_CONFIG

Description:

- Macro to configure the RTC clock (RTCCLK).

Parameters:

- __RTC_CLKSOURCE__: specifies the RTC clock source. This parameter can be one of the following values: RCC_RTCCLKSOURCE_LSE LSE selected as RTC clock. RCC_RTCCLKSOURCE_LSI LSI selected as RTC clock. RCC_RTCCLKSOURCE_HSE_DIVx HSE clock divided by x selected as RTC clock, where x:[1,64]

Notes:

- As the RTC clock configuration bits are in the Backup domain and write access is denied to this domain after reset, you have to enable write access using the Power Backup Access macro before to configure the RTC clock source (to be done once after reset). Once the RTC clock is configured it cannot be changed unless the Backup domain is reset using __HAL_RCC_BACKUPRESET_FORCE() and __HAL_RCC_BACKUPRESET_RELEASE() macros, or by a Power On Reset (POR).
- If the LSE or LSI is used as RTC clock source, the RTC continues to work in STOP and STANDBY modes, and can be used as wakeup source. However, when the HSE clock is used as RTC clock source, the RTC cannot be used in STOP and STANDBY modes. The maximum input clock frequency for RTC is 1MHz (when using HSE as RTC clock source).

__HAL_RCC_RTC_CLKPRESCALER

Description:

- Macro to configure the RTC clock prescaler for HSE for RTCCLK.

Parameters:

- __RTC_CLKSOURCE__: specifies the RTC clock prescaler for HSE. This parameter can be one of the following values: RCC_RTCCLKSOURCE_HSE_DIVx HSE clock divided by x selected as RTC clock, where x:[1,64]

__HAL_RCC_GET_RTC_SOURCE

Description:

- Macros to get the RTC clock (RTCCLK).

Return value:

- The: returned value can be one of the following values: RCC_RTCCLKSOURCE_DISABLE No clock selected as RTC clock. RCC_RTCCLKSOURCE_LSE LSE selected as RTC clock. RCC_RTCCLKSOURCE_LSI LSI selected as RTC clock. RCC_RTCCLKSOURCE_HSE_DIVx HSE clock divided by x selected as RTC clock, where x:[1,64]

__HAL_RCC_BACKUPRESET_FORCE

Notes:

- This function resets the RTC peripheral (including the backup registers) and the RTC clock source selection in RCC_BDCR register. The BKPSRAM is not affected by this reset.

__HAL_RCC_BACKUPRESET_RELEASE

__HAL_RCC_PLL1_ENABLE

Notes:

- After enabling the PLL1, the application software should wait on PLL1RDY flag to be set indicating that PLL1 clock is stable and can be used as CPU and/or system bus and/or kernel clock source thru ICx. The PLL1 can not be disabled if it is used as system clock source The PLL1 is disabled by hardware when entering STOP and STANDBY modes.

__HAL_RCC_PLL1_DISABLE

__HAL_RCC_PLL1CLKOUT_ENABLE

__HAL_RCC_PLL1CLKOUT_DISABLE

__HAL_RCC_PLL1_CONFIG

Description:

- Macro to configure the PLL1 in integer mode with clock source, multiplication and division factors.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN I2S_CKIN clock selected as PLL clock entry
- __PLLM__: specifies the division factor for PLL VCO input clock. This parameter must be a number between 1 and 63.
- __PLLN__: specifies the multiplication factor for PLL VCO output clock. This parameter must be a number between 16 and 2500.
- __PLLP1__: specifies the post division factor 1 for system clock. This parameter must be a number between 1 and 7.
- __PLLP2__: specifies the post division factor 2 for system clock. This parameter must be a number between 1 and 7.

Return value:

- None

Notes:

- This macro must be used only when the PLL1 is disabled or the PLL1 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.
- This clock source cannot be changed on any PLL if another PLL is already enabled.
- You have to set the PLLM parameter correctly to ensure that the VCO input frequency ranges from 1 to 50 MHz.

__HAL_RCC_PLL1_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLL1 clock source.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN External I2S_CKIN clock selected as PLL clock entry

Notes:

- This macro must be used only when the PLL1 is disabled or the PLL1 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.

__HAL_RCC_GET_PLL1_OSCSOURCE

Description:

- Macro to get the clock source used as PLL1 clock source.

Return value:

- The: oscillator used as PLL clock source. The returned value can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_MSI MSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_HSE HSE oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_PIN External I2S_CKIN is used as PLL clock source.

__HAL_RCC_PLL1_DIVNFRAC_CONFIG

Description:

- Macro to configure the PLL1 clock Fractional Part Of The Multiplication Factor.

Parameters:

- __PLLDIVNFRAC__: specifies Fractional Part Of The Multiplication Factor for PLL1 VCO. It should be a value between 0 and 2^24.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL1 has been enabled.

__HAL_RCC_PLL1_FRACN_ENABLE

Description:

- Macro to enable the PLL1 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL1 has been enabled.

__HAL_RCC_PLL1_FRACN_DISABLE

Description:

- Macro to disable the PLL1 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL1 has been enabled.

__HAL_RCC_PLL2_ENABLE

Notes:

- After enabling PLL2, the application software should wait on PLL2RDY flag to be set indicating that PLL2 clock is stable and can be used as CPU and/or system bus and/or kernel clock source thru ICx. PLL2 is disabled by hardware when entering Stop and Standby modes.

__HAL_RCC_PLL2_DISABLE

__HAL_RCC_PLL2CLKOUT_ENABLE

__HAL_RCC_PLL2CLKOUT_DISABLE

__HAL_RCC_PLL2_CONFIG

Description:

- Macro to configure the PLL2 in integer mode with clock source, multiplication and division factors.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN I2S_CKIN clock selected as PLL clock entry
- __PLLM__: specifies the division factor for PLL VCO input clock This parameter must be a number between 1 and 63.
- __PLLN__: specifies the multiplication factor for PLL VCO output clock This parameter must be a number between 16 and 2500.
- __PLLP1__: specifies the post division factor 1 for system clock. This parameter must be a number between 1 and 7.
- __PLLP2__: specifies the post division factor 2 for system clock. This parameter must be a number between 1 and 7.

Return value:

- None

Notes:

- This macro must be used only when the PLL2 is disabled or the PLL2 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.
- This clock source cannot be changed on any PLL if another PLL is already enabled.
- You have to set the PLLM parameter correctly to ensure that the VCO input frequency ranges from 1 to 50 MHz.

__HAL_RCC_PLL2_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLL2 clock source.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN External I2S_CKIN clock selected as PLL clock entry

Notes:

- This macro must be used only when the PLL2 is disabled or the PLL2 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.

__HAL_RCC_GET_PLL2_OSCSOURCE

Description:

- Macro to get the clock source used as PLL2 clock source.

Return value:

- The: oscillator used as PLL clock source. The returned value can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_MSI MSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_HSE HSE oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_PIN External I2S_CKIN is used as PLL clock source.

__HAL_RCC_PLL2_DIVNFRAC_CONFIG

Description:

- Macro to configure the PLL2 clock Fractional Part Of The Multiplication Factor.

Parameters:

- __PLLDIVNFRAC__: specifies Fractional Part Of The Multiplication Factor for PLL2 VCO. It should be a value between 0 and 2^24.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL2 has been enabled.

__HAL_RCC_PLL2_FRACN_ENABLE

Description:

- Macro to enable the PLL2 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL2 has been enabled.

__HAL_RCC_PLL2_FRACN_DISABLE

Description:

- Macro to disable the PLL2 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL2 has been enabled.

__HAL_RCC_PLL3_ENABLE

Notes:

- After enabling PLL3, the application software should wait on PLL3RDY flag to be set indicating that PLL3 clock is stable and can be used as CPU and/or system bus and/or kernel clock source thru ICx. PLL3 is disabled by hardware when entering Stop and Standby modes.

__HAL_RCC_PLL3_DISABLE

__HAL_RCC_PLL3CLKOUT_ENABLE

__HAL_RCC_PLL3CLKOUT_DISABLE

__HAL_RCC_PLL3_CONFIG

Description:

- Macro to configure the PLL3 in integer mode with clock source, multiplication and division factors.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN I2S_CKIN clock selected as PLL clock entry
- __PLLM__: specifies the division factor for PLL VCO input clock This parameter must be a number between 1 and 63.
- __PLLN__: specifies the multiplication factor for PLL VCO output clock This parameter must be a number between 16 and 2500.
- __PLLP1__: specifies the post division factor 1 for system clock. This parameter must be a number between 1 and 7.
- __PLLP2__: specifies the post division factor 2 for system clock. This parameter must be a number between 1 and 7.

Return value:

- None

Notes:

- This macro must be used only when the PLL3 is disabled or the PLL3 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.
- This clock source cannot be changed on any PLL if another PLL is already enabled.
- You have to set the PLLM parameter correctly to ensure that the VCO input frequency ranges from 1 to 50 MHz.

__HAL_RCC_PLL3_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLL3 clock source.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN External I2S_CKIN clock selected as PLL clock entry

Notes:

- This macro must be used only when the PLL3 is disabled or the PLL3 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.

__HAL_RCC_GET_PLL3_OSCSOURCE

Description:

- Macro to get the clock source used as PLL3 clock source.

Return value:

- The: oscillator used as PLL clock source. The returned value can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_MSI MSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_HSE HSE oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_PIN External I2S_CKIN is used as PLL clock source.

__HAL_RCC_PLL3_DIVNFRAC_CONFIG

Description:

- Macro to configure the PLL3 clock Fractional Part Of The Multiplication Factor.

Parameters:

- __PLLDIVNFRAC__: specifies Fractional Part Of The Multiplication Factor for PLL3 VCO. It should be a value between 0 and 2^24.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL3 has been enabled.

__HAL_RCC_PLL3_FRACN_ENABLE

Description:

- Macro to enable the PLL3 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL3 has been enabled.

__HAL_RCC_PLL3_FRACN_DISABLE

Description:

- Macro to disable the PLL3 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL3 has been enabled.

__HAL_RCC_PLL4_ENABLE

Notes:

- After enabling PLL4, the application software should wait on PLL4RDY flag to be set indicating that PLL4 clock is stable and can be used as CPU and/or system bus and/or kernel clock source thru ICx. PLL4 is disabled by hardware when entering Stop and Standby modes.

__HAL_RCC_PLL4_DISABLE

__HAL_RCC_PLL4CLKOUT_ENABLE

__HAL_RCC_PLL4CLKOUT_DISABLE

__HAL_RCC_PLL4_CONFIG

Description:

- Macro to configure the PLL4 in integer mode with clock source, multiplication and division factors.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN I2S_CKIN clock selected as PLL clock entry
- __PLLM__: specifies the division factor for PLL VCO input clock This parameter must be a number between 1 and 63.
- __PLLN__: specifies the multiplication factor for PLL VCO output clock This parameter must be a number between 16 and 2500.
- __PLLP1__: specifies the post division factor 1 for system clock. This parameter must be a number between 1 and 7.
- __PLLP2__: specifies the post division factor 2 for system clock. This parameter must be a number between 1 and 7.

Return value:

- None

Notes:

- This macro must be used only when the PLL4 is disabled or the PLL4 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.
- This clock source cannot be changed on any PLL if another PLL is already enabled.
- You have to set the PLLM parameter correctly to ensure that the VCO input frequency ranges from 1 to 50 MHz.

__HAL_RCC_PLL4_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLL4 clock source.

Parameters:

- __PLLSOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_MSI MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE HSE oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_PIN External I2S_CKIN clock selected as PLL clock entry

Notes:

- This macro must be used only when the PLL4 is disabled or the PLL4 output is bypassed and driven by the PLL reference clock. This macro switches off the bypass mode.

__HAL_RCC_GET_PLL4_OSCSOURCE

Description:

- Macro to get the clock source used as PLL4 clock source.

Return value:

- The: oscillator used as PLL clock source. The returned value can be one of the following values:
  - RCC_PLLSOURCE_HSI HSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_MSI MSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_HSE HSE oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_PIN External I2S_CKIN is used as PLL clock source.

__HAL_RCC_PLL4_DIVNFRAC_CONFIG

Description:

- Macro to configure the PLL4 clock Fractional Part Of The Multiplication Factor.

Parameters:

- __PLLDIVNFRAC__: specifies Fractional Part Of The Multiplication Factor for PLL4 VCO. It should be a value between 0 and 2^24.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL4 has been enabled.

__HAL_RCC_PLL4_FRACN_ENABLE

Description:

- Macro to enable the PLL4 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL4 has been enabled.

__HAL_RCC_PLL4_FRACN_DISABLE

Description:

- Macro to disable the PLL4 clock Fractional mode.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL4 has been enabled.

__HAL_RCC_CPUCLK_CONFIG

Description:

- Macro to configure the CPU clock source.

Parameters:

- __CPUCLKSOURCE__: specifies the CPU clock source. This parameter can be one of the following values:
  - RCC_CPUCLKSOURCE_HSI HSI oscillator is used as CPU clock source.
  - RCC_CPUCLKSOURCE_MSI MSI oscillator is used as CPU clock source.
  - RCC_CPUCLKSOURCE_HSE HSE oscillator is used as CPU clock source.
  - RCC_CPUCLKSOURCE_IC1 IC1 output is used as CPU clock source.

Return value:

- None

__HAL_RCC_GET_CPUCLK_SOURCE

Description:

- Macro to get the clock source used as CPU clock.

Return value:

- The: clock source used as CPU clock. The returned value can be one of the following values:
  - RCC_CPUCLKSOURCE_STATUS_HSI HSI used as CPU clock.
  - RCC_CPUCLKSOURCE_STATUS_MSI MSI used as CPU clock.
  - RCC_CPUCLKSOURCE_STATUS_HSE HSE used as CPU clock.
  - RCC_CPUCLKSOURCE_STATUS_IC1 IC1 used as CPU clock.

__HAL_RCC_SYSCLK_CONFIG

Description:

- Macro to configure the system bus clock source.

Parameters:

- __SYSCLKSOURCE__: specifies the system clock source. This parameter can be one of the following values:
  - RCC_SYSCLKSOURCE_HSI HSI oscillator is used as system bus clock source.
  - RCC_SYSCLKSOURCE_MSI MSI oscillator is used as system bus clock source.
  - RCC_SYSCLKSOURCE_HSE HSE oscillator is used as system bus clock source.
  - RCC_SYSCLKSOURCE_IC2_IC6_IC11 IC2, IC6 and IC11 outputs are used as system bus clock source.

Return value:

- None

__HAL_RCC_GET_SYSCLK_SOURCE

Description:

- Macro to get the clock source used as system bus clock.

Return value:

- The: clock source used as system clock. The returned value can be one of the following values:
  - RCC_SYSCLKSOURCE_STATUS_HSI HSI used as system bus clock.
  - RCC_SYSCLKSOURCE_STATUS_MSI MSI used as system bus clock.
  - RCC_SYSCLKSOURCE_STATUS_HSE HSE used as system bus clock.
  - RCC_SYSCLKSOURCE_STATUS_IC2_IC6_IC11 IC2, IC6 and IC11 outputs used as system bus clock.

__HAL_RCC_LSEDRIVE_CONFIG

Description:

- Macro to configure the External Low Speed oscillator (LSE) drive capability.

Parameters:

- __LSEDRIVE__: specifies the new state of the LSE drive capability. This parameter can be one of the following values:
  - RCC_LSEDRIVE_LOW LSE oscillator low drive capability.
  - RCC_LSEDRIVE_MEDIUMLOW LSE oscillator medium low drive capability.
  - RCC_LSEDRIVE_MEDIUMHIGH LSE oscillator medium high drive capability.
  - RCC_LSEDRIVE_HIGH LSE oscillator high drive capability.

Return value:

- None

Notes:

- As the LSE is in the Backup domain and write access is denied to this domain after reset, you have to enable write access using HAL_PWR_EnableBkUpAccess() function before to configure the LSE (to be done once after reset). This parameter cannot be updated while LSE is ON.

__HAL_RCC_WAKEUPSTOP_CLK_CONFIG

Description:

- Macro to configure the wake up from stop clock.

Parameters:

- __STOPWUCLK__: specifies the clock source used after wake up from stop This parameter can be one of the following values:
  - RCC_STOP_WAKEUPCLOCK_HSI HSI selected as system clock source
  - RCC_STOP_WAKEUPCLOCK_MSI MSI selected as system clock source

Return value:

- None

Flags Interrupts Management

__HAL_RCC_ENABLE_IT

Description:

- Enable RCC interrupt.

Parameters:

- __INTERRUPT__: specifies the RCC interrupt source(s) to be enabled. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_MSIRDY MSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY PLL1 ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_PLL4RDY PLL4 ready interrupt
  - RCC_IT_LSECSS LSE clock security system interrupt
  - RCC_IT_HSECSS HSE clock security system interrupt
  - RCC_IT_WKUP CPU wakeup interrupt

__HAL_RCC_DISABLE_IT

Description:

- Disable RCC interrupt.

Parameters:

- __INTERRUPT__: specifies the RCC interrupt source(s) to be disabled. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_MSIRDY MSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY PLL1 ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_PLL4RDY PLL4 ready interrupt
  - RCC_IT_LSECSS LSE clock security system interrupt
  - RCC_IT_HSECSS HSE clock security system interrupt
  - RCC_IT_WKUP CPU wakeup interrupt

__HAL_RCC_CLEAR_IT

Description:

- Clear the RCC's interrupt pending bits.

Parameters:

- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_MSIRDY MSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY PLL1 ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_PLL4RDY PLL4 ready interrupt
  - RCC_IT_LSECSS LSE clock security system interrupt
  - RCC_IT_HSECSS HSE clock security interrupt
  - RCC_IT_WKUP CPU wakeup interrupt

__HAL_RCC_GET_IT

Description:

- Check whether the RCC interrupt has occurred or not.

Parameters:

- __INTERRUPT__: specifies the RCC interrupt source to check. This parameter can be one of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_MSIRDY MSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLL1RDY PLL1 ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_PLL4RDY PLL4 ready interrupt
  - RCC_IT_LSECSS LSE clock security system interrupt
  - RCC_IT_HSECSS HSE clock security interrupt
  - RCC_IT_WKUP CPU wakeup interrupt

Return value:

- The: pending state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RCC_CLEAR_RESET_FLAGS

The reset flags are: RCC_FLAG_LCKRST, RCC_FLAG_BORRST, RCC_FLAG_PINRST, RCC_FLAG_PORRST, RCC_FLAG_SFTRST, RCC_FLAG_IWDGRST, RCC_FLAG_WWDGRST and RCC_FLAG_LPWRRST.

__HAL_RCC_GET_FLAG

Description:

- Check whether the selected RCC flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - RCC_FLAG_LCKRST CPU lockup reset flag
  - RCC_FLAG_BORRST BOR reset flag
  - RCC_FLAG_PINRST Pin reset flag
  - RCC_FLAG_PORRST Power-on reset flag
  - RCC_FLAG_SFTRST Software reset flag
  - RCC_FLAG_IWDGRST Independent Watchdog reset flag
  - RCC_FLAG_WWDGRST Window Watchdog reset flag
  - RCC_FLAG_LPWRRST Low Power reset flag
  - RCC_FLAG_LSECSSD Clock security system failure on LSE oscillator detection flag
  - RCC_FLAG_HSECSSD Clock security system failure on HSE oscillator detection flag
  - RCC_FLAG_LSIRDY LSI oscillator clock ready flag
  - RCC_FLAG_LSERDY LSE oscillator clock ready flag
  - RCC_FLAG_HSIRDY HSI oscillator clock ready flag
  - RCC_FLAG_MSIRDY MSI oscillator clock ready flag
  - RCC_FLAG_HSERDY HSE oscillator clock ready flag
  - RCC_FLAG_PLL1RDY PLL1 ready flag
  - RCC_FLAG_PLL2RDY PLL2 ready flag
  - RCC_FLAG_PLL3RDY PLL3 ready flag
  - RCC_FLAG_PLL4RDY PLL4 ready flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

Field Documentation

- ***uint64_t RCC_PeriphCLKInitTypeDef::PeriphClockSelection***
  The Extended Clock to be configured. This parameter can be a value of ***RCCEx_Periph_Clock_Selection***
- ***RCC_ICInitTypeDef RCC_PeriphCLKInitTypeDef::ICSelection[RCC_IC_MAX_NUMBER]***
  ICx structure parameters. This parameter shall be used when ICx is selected as kernel clock source for some peripherals
- ***uint32_t RCC_PeriphCLKInitTypeDef::FmcClockSelection***
  Specifies FMC clock source. This parameter can be a value of ***RCCEx_FMC_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Xspi1ClockSelection***
  Specifies XSPI1 clock source. This parameter can be a value of ***RCCEx_XSPI1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Xspi2ClockSelection***
  Specifies XSPI2 clock source. This parameter can be a value of ***RCCEx_XSPI2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Xspi3ClockSelection***
  Specifies XSPI3 clock source. This parameter can be a value of ***RCCEx_XSPI3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::CkperClockSelection***
  Specifies CKPER clock source. This parameter can be a value of ***RCCEx_CLKP_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::AdcClockSelection***
  Specifies ADC interface clock source. This parameter can be a value of ***RCCEx_ADC_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::AdcDivider***
  Specifies ADC clock divider. This parameter can be a value between 1 to 256
- ***uint32_t RCC_PeriphCLKInitTypeDef::Adf1ClockSelection***
  Specifies ADF1 Clock clock source. This parameter can be a value of ***RCCEx_ADF1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::DcmippClockSelection***
  Specifies DCMIPP clock source. This parameter can be a value of ***RCCEx_DCMIPP_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Eth1ClockSelection***
  Specifies ETH1 clock source. This parameter can be a value of ***RCCEx_ETH1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Eth1PhyInterfaceSelection***
  Specifies ETH1 PHY interface. This parameter can be a value of ***RCCEx_ETH1_PHY_Interface***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Eth1RxClockSelection***
  Specifies ETH1 RX clock source. This parameter can be a value of ***RCCEx_ETH1_RX_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Eth1TxClockSelection***
  Specifies ETH1 TX clock source. This parameter can be a value of ***RCCEx_ETH1_TX_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Eth1PtpClockSelection***
  Specifies ETH1 PTP clock source. This parameter can be a value of ***RCCEx_ETH1_PTP_Clock_Source***

- ***uint32_t RCC_PeriphCLKInitTypeDef::Eth1PtpDivider***
  Specifies ETH1 PTP clock divider. This parameter can be a value between 1 to 16
- ***uint32_t RCC_PeriphCLKInitTypeDef::FdcanClockSelection***
  Specifies FDCAN kernel clock source. This parameter can be a value of ***RCCEx_FDCAN_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c1ClockSelection***
  Specifies I2C1 clock source. This parameter can be a value of ***RCCEx_I2C1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c2ClockSelection***
  Specifies I2C2 clock source. This parameter can be a value of ***RCCEx_I2C2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c3ClockSelection***
  Specifies I2C3 clock source. This parameter can be a value of ***RCCEx_I2C3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I2c4ClockSelection***
  Specifies I2C4 clock source. This parameter can be a value of ***RCCEx_I2C4_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I3c1ClockSelection***
  Specifies I3C1 clock source. This parameter can be a value of ***RCCEx_I3C1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::I3c2ClockSelection***
  Specifies I3C2 clock source. This parameter can be a value of ***RCCEx_I3C2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim1ClockSelection***
  Specifies LPTIM1 clock source. This parameter can be a value of ***RCCEx_LPTIM1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim2ClockSelection***
  Specifies LPTIM2 clock source. This parameter can be a value of ***RCCEx_LPTIM2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim3ClockSelection***
  Specifies LPTIM3 clock source. This parameter can be a value of ***RCCEx_LPTIM3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim4ClockSelection***
  Specifies LPTIM4 clock source. This parameter can be a value of ***RCCEx_LPTIM4_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lptim5ClockSelection***
  Specifies LPTIM5 clock source. This parameter can be a value of ***RCCEx_LPTIM5_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Lpuart1ClockSelection***
  Specifies LPUART1 clock source. This parameter can be a value of ***RCCEx_LPUART1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::LtdcClockSelection***
  Specifies LPUART1 clock source. This parameter can be a value of ***RCCEx_LTDC_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Mdf1ClockSelection***
  Specifies MDF1 Clock clock source. This parameter can be a value of ***RCCEx_MDF1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::PssiClockSelection***
  Specifies PSSI clock source. This parameter can be a value of ***RCCEx_PSSI_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sai1ClockSelection***
  Specifies SAI1 clock source. This parameter can be a value of ***RCCEx_SAI1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sai2ClockSelection***
  Specifies SAI2 clock source. This parameter can be a value of ***RCCEx_SAI2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sdmmc1ClockSelection***
  Specifies SDMMC1 clock source. This parameter can be a value of ***RCCEx_SDMMC1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Sdmmc2ClockSelection***
  Specifies SDMMC2 clock source. This parameter can be a value of ***RCCEx_SDMMC2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi1ClockSelection***
  Specifies SPI1 clock source. This parameter can be a value of ***RCCEx_SPI1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi2ClockSelection***
  Specifies SPI2 clock source. This parameter can be a value of ***RCCEx_SPI2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi3ClockSelection***
  Specifies SPI3 clock source. This parameter can be a value of ***RCCEx_SPI3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi4ClockSelection***
  Specifies SPI4 clock source. This parameter can be a value of ***RCCEx_SPI4_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi5ClockSelection***
  Specifies SPI5 clock source. This parameter can be a value of ***RCCEx_SPI5_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Spi6ClockSelection***
  Specifies SPI6 clock source. This parameter can be a value of ***RCCEx_SPI6_Clock_Source***

- ***uint32_t RCC_PeriphCLKInitTypeDef::Spdifrx1ClockSelection***
  Specifies SPDIFRX1 Clock clock source. This parameter can be a value of ***RCCEx_SPDIFRX1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Usart1ClockSelection***
  Specifies USART1 clock source. This parameter can be a value of ***RCCEx_USART1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Usart2ClockSelection***
  Specifies USART2 clock source. This parameter can be a value of ***RCCEx_USART2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Usart3ClockSelection***
  Specifies USART3 clock source. This parameter can be a value of ***RCCEx_USART3_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart4ClockSelection***
  Specifies UART4 clock source. This parameter can be a value of ***RCCEx_UART4_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart5ClockSelection***
  Specifies UART5 clock source. This parameter can be a value of ***RCCEx_UART5_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Usart6ClockSelection***
  Specifies USART6 clock source. This parameter can be a value of ***RCCEx_USART6_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart7ClockSelection***
  Specifies UART7 clock source. This parameter can be a value of ***RCCEx_UART7_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart8ClockSelection***
  Specifies UART8 clock source. This parameter can be a value of ***RCCEx_UART8_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Uart9ClockSelection***
  Specifies UART9 clock source. This parameter can be a value of ***RCCEx_UART9_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::Usart10ClockSelection***
  Specifies USART10 clock source. This parameter can be a value of ***RCCEx_USART10_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::UsbPhy1ClockSelection***
  Specifies USBPHY1 clock source. This parameter can be a value of ***RCCEx_USBPHY1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::UsbOtgHs1ClockSelection***
  Specifies USB OTG HS1 clock source. This parameter can be a value of ***RCCEx_USB_OTGHS1_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::UsbPhy2ClockSelection***
  Specifies USBPHY2 clock source. This parameter can be a value of ***RCCEx_USBPHY2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::UsbOtgHs2ClockSelection***
  Specifies USB OTG HS2 clock source. This parameter can be a value of ***RCCEx_USB_OTGHS2_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::RTCClockSelection***
  Specifies RTC Clock clock source. This parameter can be a value of ***RCC_RTC_Clock_Source***
- ***uint32_t RCC_PeriphCLKInitTypeDef::TIMPresSelection***
  Specifies TIM Clock Prescalers Selection. This parameter can be a value of ***RCCEx_TIM_Prescaler_Selection***

57.1.2 RCC_PLLSSCGInitTypeDef

RCC_PLLSSCGInitTypeDef is defined in the stm32n6xx_hal_rcc_ex.h

Data Fields

- ***uint32_t PLLModDiv***
- ***uint32_t PLLModSpreadDepth***
- ***uint32_t PLLModSpreadMode***

Field Documentation

- ***uint32_t RCC_PLLSSCGInitTypeDef::PLLModDiv***
  Modulation division frequency. This parameter must be a number between Min_Data = 0 and Max_Data = 0xF
- ***uint32_t RCC_PLLSSCGInitTypeDef::PLLModSpreadDepth***
  Modulation spread spectrum depth. This parameter must be a number between Min_Data = 0 and Max_Data = 0x1F
- ***uint32_t RCC_PLLSSCGInitTypeDef::PLLModSpreadMode***
  Modulation spread spectrum mode. This parameter must be a value of ***RCC_PLL_SSCGSpread_Mode***

57.2 RCCEx Firmware driver API description

The following section lists the various functions of the RCCEx library.

57.2.1 Extended Peripheral Control functions

This subsection provides a set of functions allowing to control the RCC Clocks frequencies.

Note: Important note: Care must be taken when HAL_RCCEx_PeriphCLKConfig() is used to select the RTC clock source; in this case the Backup domain will be reset in order to modify the RTC Clock source, as consequence RTC registers (including the backup registers) and RCC_BDCR register are set to their reset values.

This section contains the following APIs:

- *HAL_RCCEx_PeriphCLKConfig()*
- *HAL_RCCEx_GetPeriphCLKConfig()*
- *HAL_RCCEx_GetPeriphCLKFreq()*
- *HAL_RCCEx_GetPLL1CLKFreq()*
- *HAL_RCCEx_GetPLL2CLKFreq()*
- *HAL_RCCEx_GetPLL3CLKFreq()*
- *HAL_RCCEx_GetPLL4CLKFreq()*

57.2.2 Detailed description of functions

HAL_RCCEx_PeriphCLKConfig

Function name

HAL_StatusTypeDef HAL_RCCEx_PeriphCLKConfig (const RCC_PeriphCLKInitTypeDef * PeriphClkInit)

Function description

Initializes the RCC extended peripherals clocks according to the specified parameters in the RCC_PeriphCLKInitTypeDef.

Parameters

- **PeriphClkInit:** pointer to an RCC_PeriphCLKInitTypeDef structure that contains the configuration information for the Extended Peripherals clocks (ADC, ADF1, CKPER, DCMI, DCMIPP, FDCAN, FMC, I2C1, I2C2, I2C3, I2C4, I3C1, I3C2, LPTIM1, LPTIM2, LPTIM3, LPTIM4, LPTIM5, LTDC, LPUART1, MDF1, PSSI, RTC, SAI1, SAI2, SDMMC1, SDMMC2, SPDIFRX1, SPI1, SPI2, SPI3, SPI4, SPI5, SPI6, TIM, USART1, USART2, USART3, UART4, UART5, USART6, UART7, UART8, UART9, USART10, USBPHY1, USBPHY2, USB OTGHS1, USB OTGHS2, XSPI1, XSPI2, XSPI3).

Return values

- **HAL:** status

Notes

- Care must be taken when HAL_RCCEx_PeriphCLKConfig() is used to select the RTC clock source; in this case the Backup domain will be reset in order to modify the RTC Clock source, as consequence RTC registers (including the backup registers) are set to their reset values.
- Dynamic switches are used for peripheral input clock selection meaning the switch setting can only be changed if both input clocks are present during transition time.
- Care must be taken when RCC_PPPCLKSOURCE_ICx is selected. The ICx ClockSelection and ClockDivider fields modification indeed impacts all peripherals using this ICx as clock source.

HAL_RCCEx_GetPeriphCLKConfig

Function name

void HAL_RCCEx_GetPeriphCLKConfig (RCC_PeriphCLKInitTypeDef * PeriphClkInit)

Function description

Get the RCC_ClkInitStruct according to the internal RCC configuration registers.

Parameters

- **PeriphClkInit:** pointer to an RCC_PeriphCLKInitTypeDef structure that returns the configuration information for the Extended Peripherals clocks : (ADC, ADF1, CKPER, DCMI, DCMIPP, FDCAN, FMC, I2C1, I2C2, I2C3, I2C4, I3C1, I3C2, LPTIM1, LPTIM2, LPTIM3, LPTIM4, LPTIM5, LTDC, LPUART1, MDF1, PSSI, RTC, SAI1, SAI2, SDMMC1, SDMMC2, SPDIFRX1, SPI1, SPI2, SPI3, SPI4, SPI5, SPI6, TIM, USART1, USART2, USART3, UART4, UART5, USART6, UART7, UART8, UART9, USART10, USBPHYC, USB OTGFS, XSPI1, XSPI2, XSPI3).

Return values

- **None:**

HAL_RCCEx_GetPeriphCLKFreq

Function name

uint32_t HAL_RCCEx_GetPeriphCLKFreq (uint64_t PeriphClk)

Function description

Return the peripheral clock frequency for a given peripheral (SAI..)

Parameters

- **PeriphClk:** Peripheral clock identifier This parameter can be one of the following values:
  - RCC_PERIPHCLK_ADC : ADC peripheral clock
  - RCC_PERIPHCLK_ADF1 : ADF1 peripheral clock
  - RCC_PERIPHCLK_CSI : CSI peripheral clock
  - RCC_PERIPHCLK_DCMIPP : DCMIPP peripheral clock
  - RCC_PERIPHCLK_I2C1 : I2C1 peripheral clock
  - RCC_PERIPHCLK_I2C2 : I2C2 peripheral clock
  - RCC_PERIPHCLK_I2C3 : I2C3 peripheral clock
  - RCC_PERIPHCLK_I2C4 : I2C4 peripheral clock
  - RCC_PERIPHCLK_I3C1 : I3C1 peripheral clock
  - RCC_PERIPHCLK_I3C2 : I3C2 peripheral clock
  - RCC_PERIPHCLK_FDCAN : FDCAN peripheral clock
  - RCC_PERIPHCLK_FMC : FMC peripheral clock
  - RCC_PERIPHCLK_LPTIM1 : LPTIM1 peripheral clock
  - RCC_PERIPHCLK_LPTIM2 : LPTIM2 peripheral clock
  - RCC_PERIPHCLK_LPTIM3 : LPTIM3 peripheral clock
  - RCC_PERIPHCLK_LPTIM4 : LPTIM4 peripheral clock
  - RCC_PERIPHCLK_LPTIM5 : LPTIM5 peripheral clock
  - RCC_PERIPHCLK_LPUART1 : LPUART1 peripheral clock
  - RCC_PERIPHCLK_LTDC : LTDC peripheral clock
  - RCC_PERIPHCLK_MDF1 : MDF1 peripheral clock
  - RCC_PERIPHCLK_PSSI : PSSI peripheral clock
  - RCC_PERIPHCLK_SAI1 : SAI1 peripheral clock
  - RCC_PERIPHCLK_SAI2 : SAI2 peripheral clock
  - RCC_PERIPHCLK_SDMMC1 : SDMMC1 peripheral clock
  - RCC_PERIPHCLK_SDMMC2 : SDMMC2 peripheral clock
  - RCC_PERIPHCLK_SPDIFRX1 : SPDIFRX1 peripheral clock
  - RCC_PERIPHCLK_SPI1 : SPI1 peripheral clock
  - RCC_PERIPHCLK_SPI2 : SPI2 peripheral clock
  - RCC_PERIPHCLK_SPI3 : SPI3 peripheral clock
  - RCC_PERIPHCLK_SPI4 : SPI4 peripheral clock
  - RCC_PERIPHCLK_SPI5 : SPI5 peripheral clock
  - RCC_PERIPHCLK_SPI6 : SPI6 peripheral clock
  - RCC_PERIPHCLK_USART1 : USART1 peripheral clock
  - RCC_PERIPHCLK_USART2 : USART2 peripheral clock
  - RCC_PERIPHCLK_USART3 : USART3 peripheral clock
  - RCC_PERIPHCLK_UART4 : UART4 peripheral clock
  - RCC_PERIPHCLK_UART5 : UART5 peripheral clock
  - RCC_PERIPHCLK_USART6 : USART6 peripheral clock
  - RCC_PERIPHCLK_UART7 : UART7 peripheral clock
  - RCC_PERIPHCLK_UART8 : UART8 peripheral clock
  - RCC_PERIPHCLK_UART9 : UART9 peripheral clock
  - RCC_PERIPHCLK_USART10 : USART10 peripheral clock
  - RCC_PERIPHCLK_XSPI1 : XSPI1 peripheral clock
  - RCC_PERIPHCLK_XSPI2 : XSPI2 peripheral clock
  - RCC_PERIPHCLK_XSPI3 : XSPI3 peripheral clock

Return values

- **Frequency:** in KHz

Notes

- Return 0 if peripheral clock identifier not managed by this API or if the selected clock source is not enabled (HSI, PLLs clock output..)

HAL_RCCEx_GetPLL1CLKFreq

Function name

uint32_t HAL_RCCEx_GetPLL1CLKFreq (void)

Function description

Return PLL1 clock frequency.

Return values

- **PLL1:** output clock frequency

Notes

- RCC_PERIPH_FREQUENCY_NO returned for non activated output or oscillator not ready

HAL_RCCEx_GetPLL2CLKFreq

Function name

uint32_t HAL_RCCEx_GetPLL2CLKFreq (void)

Function description

Return PLL2 clock frequency.

Return values

- **PLL2:** output clock frequency

Notes

- RCC_PERIPH_FREQUENCY_NO returned for non activated output or oscillator not ready

HAL_RCCEx_GetPLL3CLKFreq

Function name

uint32_t HAL_RCCEx_GetPLL3CLKFreq (void)

Function description

Return PLL3 clock frequency.

Return values

- **PLL3:** output clock frequency

Notes

- RCC_PERIPH_FREQUENCY_NO returned for non activated output or oscillator not ready

HAL_RCCEx_GetPLL4CLKFreq

Function name

uint32_t HAL_RCCEx_GetPLL4CLKFreq (void)

Function description

Return PLL4 clock frequency.

Return values

- **PLL4:** output clock frequency

Notes

- RCC_PERIPH_FREQUENCY_NO returned for non activated output or oscillator not ready

HAL_RCCEx_WakeUpStopCLKConfig

Function name

void HAL_RCCEx_WakeUpStopCLKConfig (uint32_t WakeUpClk)

Function description

Configure the oscillator clock source for wakeup from Stop and CSS backup clock.

Parameters

- **WakeUpClk:** Wakeup clock This parameter can be one of the following values:
  - RCC_STOP_WAKEUPCLOCK_MSI: MSI oscillator selection
  - RCC_STOP_WAKEUPCLOCK_HSI: HSI oscillator selection

Return values

- **None:**

Notes

- This function shall not be called after the Clock Security System on HSE has been enabled and the system clock is HSE or a switch on HSE is requested.

HAL_RCCEx_EnableLSECSS

Function name

void HAL_RCCEx_EnableLSECSS (void)

Function description

Enable the LSE Clock Security System.

Return values

- **None:**

Notes

- Prior to enable the LSE Clock Security System, LSE oscillator is to be enabled with HAL_RCC_OscConfig() and the LSE oscillator clock is to be selected as RTC clock with HAL_RCCEx_PeriphCLKConfig().
- Backup domain access should be enabled

HAL_RCCEx_DisableLSECSS

Function name

void HAL_RCCEx_DisableLSECSS (void)

Function description

Disable the LSE Clock Security System.

Return values

- **None:**

Notes

- LSE Clock Security System can only be disabled after a LSE failure detection.
- Backup domain access should be enabled

HAL_RCCEx_EnableLSECSS_IT

Function name

void HAL_RCCEx_EnableLSECSS_IT (void)

Function description

Enable the LSE Clock Security System Interrupt.

Return values

- **None:**

Notes

- LSE Clock Security System Interrupt is mapped on EXTI line 65 which must be enabled at application level to wake up from low power modes

HAL_RCCEx_DisableLSECSS_IT

Function name

void HAL_RCCEx_DisableLSECSS_IT (void)

Function description

Disable the LSE Clock Security System Interrupt.

Return values

- **None:**

HAL_RCCEx_ReArmLSECSS

Function name

void HAL_RCCEx_ReArmLSECSS (void)

Function description

Rearm the LSE Clock Security System.

Return values

- **None:**

Notes

- Allow to re-arm the LSE Clock Security System after a LSE failure detection

HAL_RCCEx_LSECSS_IRQHandler

Function name

void HAL_RCCEx_LSECSS_IRQHandler (void)

Function description

Handle the RCC LSE Clock Security System interrupt request.

Return values

- **None:**

HAL_RCCEx_LSECSS_Callback

Function name

void HAL_RCCEx_LSECSS_Callback (void)

Function description

RCCEx LSE Clock Security System interrupt callback.

Return values

- **none:**

HAL_RCCEx_PLLSSCGConfig

Function name

HAL_StatusTypeDef HAL_RCCEx_PLLSSCGConfig (uint32_t PLLnumber, const RCC_PLLInitTypeDef * pPLLInit, const RCC_PLLSSCGInitTypeDef * pPLLSSCGInit)

Function description

Configure the requested PLL to SSCG Mode.

Parameters

- **PLLnumber:** PLL number to configure. This parameter can be one of the following values: PLL selection
- **pPLLInit:** Pointer to an RCC_PLLInitTypeDef structure that contains the configuration parameters.
- **pPLLSSCGInit:** Pointer to an RCC_PLLSSCGInitTypeDef structure that contains the configuration parameters specific to SSCG.

Return values

- **HAL:** status

Notes

- PLL is temporary disabled to apply new parameters

57.3 RCCEx Firmware driver defines

RCCEx Exported Macros

__HAL_RCC_PLL1_MODSPR_CONFIG

Description:

- Macro to configure the PLL1 SSCG Spread Depth.

Parameters:

- __PLLMODSPR__: specifies the SSCG modulation spread depth. It should be a value between 0 and 0x1F.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL1 has been enabled.

__HAL_RCC_PLL1_MODSPRDW_CONFIG

Description:

- Macro to configure the PLL1 SSCG Spread Mode.

Parameters:

- __PLLMODSPRDW__: specifies the SSCG modulation spread mode. It should be a value of

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL1 has been enabled.

__HAL_RCC_PLL2_MODSPR_CONFIG

Description:

- Macro to configure the PLL2 SSCG Spread Depth.

Parameters:

- __PLLMODSPR__: specifies the SSCG modulation spread depth. It should be a value between 0 and 0x1F.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL2 has been enabled.

__HAL_RCC_PLL2_MODSPRDW_CONFIG

Description:

- Macro to configure the PLL2 SSCG Spread Mode.

Parameters:

- __PLLMODSPRDW__: specifies the SSCG modulation spread mode. It should be a value of

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL2 has been enabled.

__HAL_RCC_PLL3_MODSPR_CONFIG

Description:

- Macro to configure the PLL3 SSCG Spread Depth.

Parameters:

- __PLLMODSPR__: specifies the SSCG modulation spread depth. It should be a value between 0 and 0x1F.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL3 has been enabled.

__HAL_RCC_PLL3_MODSPRDW_CONFIG

Description:

- Macro to configure the PLL3 SSCG Spread Mode.

Parameters:

- __PLLMODSPRDW__: specifies the SSCG modulation spread mode. It should be a value of

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL3 has been enabled.

__HAL_RCC_PLL4_MODSPR_CONFIG

Description:

- Macro to configure the PLL4 SSCG Spread Depth.

Parameters:

- __PLLMODSPR__: specifies the SSCG modulation spread depth. It should be a value between 0 and 0x1F.

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL4 has been enabled.

__HAL_RCC_PLL4_MODSPRDW_CONFIG

Description:

- Macro to configure the PLL4 SSCG Spread Mode.

Parameters:

- __PLLMODSPRDW__: specifies the SSCG modulation spread mode. It should be a value of

Return value:

- None

Notes:

- This configuration cannot be requested when the PLL4 has been enabled.

__HAL_RCC_ADC_CONFIG

Description:

- Macro to configure the ADC clock.

Parameters:

- __ADC_CLKSOURCE__: specifies the ADC clock source. This parameter can be one of the following values:
  - RCC_ADCCLKSOURCE_HCLK HCLK Clock selected as ADC clock
  - RCC_ADCCLKSOURCE_CLKP CLKP selected as ADC clock
  - RCC_ADCCLKSOURCE_IC7 IC7 selected as ADC clock
  - RCC_ADCCLKSOURCE_IC8 IC8 selected as ADC clock
  - RCC_ADCCLKSOURCE_MSI MSI selected as ADC clock
  - RCC_ADCCLKSOURCE_HSI HSI selected as ADC clock
  - RCC_ADCCLKSOURCE_PIN External I2S_CKIN selected as ADC clock
  - RCC_ADCCLKSOURCE_TIMG TIMG selected as ADC clock

__HAL_RCC_GET_ADC_SOURCE

Description:

- Macro to get the ADC clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ADCCLKSOURCE_HCLK HCLK Clock selected as ADC clock
  - RCC_ADCCLKSOURCE_CLKP CLKP selected as ADC clock
  - RCC_ADCCLKSOURCE_IC7 IC7 selected as ADC clock
  - RCC_ADCCLKSOURCE_IC8 IC8 selected as ADC clock
  - RCC_ADCCLKSOURCE_MSI MSI selected as ADC clock
  - RCC_ADCCLKSOURCE_HSI HSI selected as ADC clock
  - RCC_ADCCLKSOURCE_PIN External I2S_CKIN selected as ADC clock
  - RCC_ADCCLKSOURCE_TIMG TIMG selected as ADC clock

__HAL_RCC_ADC_DIVIDER_CONFIG

Description:

- Macro to configure the ADC clock divider.

Parameters:

- __ADC_DIVIDER__: specifies clock divider for ADC. This parameter can be a value between 1 and 256.

__HAL_RCC_GET_ADC_DIVIDER

Description:

- Macro to get the ADC clock divider.

Return value:

- The: divider can be a value between 1 and 256.

__HAL_RCC_ADF1_CONFIG

Description:

- Macro to configure the ADF1 clock.

Parameters:

- __ADF1_CLKSOURCE__: specifies the ADF1 clock source. This parameter can be one of the following values:
  - RCC_ADF1CLKSOURCE_HCLK HCLK Clock selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_CLKP CLKP selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_IC7 IC7 selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_IC8 IC8 selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_MSI MSI selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_HSI HSI selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_PIN External I2S_CKIN selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_TIMG TIMG selected as ADF1 clock

__HAL_RCC_GET_ADF1_SOURCE

Description:

- Macro to get the ADF1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ADF1CLKSOURCE_HCLK HCLK Clock selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_CLKP CLKP selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_IC7 IC7 selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_IC8 IC8 selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_MSI MSI selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_HSI HSI selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_PIN External I2S_CKIN selected as ADF1 clock
  - RCC_ADF1CLKSOURCE_TIMG TIMG selected as ADF1 clock

__HAL_RCC_CLKP_CONFIG

Description:

- Macro to configure the CLKP clock for peripheral.

Parameters:

- __CLKP_CLKSOURCE__: specifies the clock for peripheral This parameter can be one of the following values:
  - RCC_CLKPCLKSOURCE_HSI HSI selected as CLKP clock
  - RCC_CLKPCLKSOURCE_MSI MSI selected as CLKP clock
  - RCC_CLKPCLKSOURCE_HSE HSE selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC5 IC5 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC10 IC10 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC15 IC15 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC19 IC19 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC20 IC20 selected as CLKP clock

__HAL_RCC_GET_CLKP_SOURCE

Description:

- Macro to get the Oscillator clock for peripheral source.

Return value:

- The: clock source can be one of the following values:
  - RCC_CLKPCLKSOURCE_HSI HSI selected as CLKP clock
  - RCC_CLKPCLKSOURCE_MSI MSI selected as CLKP clock
  - RCC_CLKPCLKSOURCE_HSE HSE selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC5 IC5 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC10 IC10 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC15 IC15 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC19 IC19 selected as CLKP clock
  - RCC_CLKPCLKSOURCE_IC20 IC20 selected as CLKP clock

__HAL_RCC_DCMIPP_CONFIG

Description:

- Macro to configure the DCMIPP clock source.

Parameters:

- __DCMIPP_CLKSOURCE__: specifies the DCMIPP clock source.
  - RCC_DCMIPPCLKSOURCE_PCLK5 PCLK5 selected as DCMIPP clock
  - RCC_DCMIPPCLKSOURCE_CLKP CLKP selected as DCMIPP clock
  - RCC_DCMIPPCLKSOURCE_IC17 IC17 selected as DCMIPP clock
  - RCC_DCMIPPCLKSOURCE_HSI HSI selected as DCMIPP clock

__HAL_RCC_GET_DCMIPP_SOURCE

Description:

- Macro to get the DCMIPP clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_DCMIPPCLKSOURCE_PCLK5 PCLK5 selected as DCMIPP clock
  - RCC_DCMIPPCLKSOURCE_CLKP CLKP selected as DCMIPP clock
  - RCC_DCMIPPCLKSOURCE_IC17 IC17 elected as DCMIPP clock
  - RCC_DCMIPPCLKSOURCE_HSI HSI selected as DCMIPP clock

__HAL_RCC_ETH1_CONFIG

Description:

- Macro to configure the ETH1 kernel clock source.

Parameters:

- __ETH1_CLKSOURCE__: specifies clock source for ETH1 This parameter can be one of the following values:
  - RCC_ETH1CLKSOURCE_HCLK HCLK selected as ETH1 clock
  - RCC_ETH1CLKSOURCE_CLKP CLKP selected as ETH1 clock
  - RCC_ETH1CLKSOURCE_IC12 IC12 selected as ETH1 clock
  - RCC_ETH1CLKSOURCE_HSE HSE selected as ETH1 clock

__HAL_RCC_GET_ETH1_SOURCE

Description:

- Macro to get the ETH1 kernel clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ETH1CLKSOURCE_HCLK HCLK selected as ETH1 clock
  - RCC_ETH1CLKSOURCE_CLKP CLKP selected as ETH1 clock
  - RCC_ETH1CLKSOURCE_IC12 IC12 selected as ETH1 clock
  - RCC_ETH1CLKSOURCE_HSE HSE selected as ETH1 clock

__HAL_RCC_ETH1PHY_CONFIG

Description:

- Macro to configure the ETH1 PHY interface.

Parameters:

- __ETH1PHY_IF__: specifies interface for ETH1 PHY This parameter can be one of the following values:
  - RCC_ETH1PHYIF_MII MII selected as ETH1 PHY interface
  - RCC_ETH1PHYIF_RGMII RGMII selected as ETH1 PHY interface
  - RCC_ETH1PHYIF_RMII RMII selected as ETH1 PHY interface

Notes:

- This configuration must be done while ETH1 is under reset, and before enabling the ETH1 clocks

__HAL_RCC_GET_ETH1PHY_INTERFACE

Description:

- Macro to get the ETH PHY clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ETH1PHYIF_MII MII selected as ETH1 PHY interface
  - RCC_ETH1PHYIF_RGMII RGMII selected as ETH1 PHY interface
  - RCC_ETH1PHYIF_RMII RMII selected as ETH1 PHY interface

__HAL_RCC_ETH1RX_CONFIG

Description:

- Macro to configure the ETH1 reference Rx clock source.

Parameters:

- __ETH1RX_CLKSOURCE__: specifies clock source for ETH1 reference Rx This parameter can be one of the following values:
  - RCC_ETH1RXCLKSOURCE_EXT External clock selected as ETH1 reference Rx clock
  - RCC_ETH1RXCLKSOURCE_INT Internal kernel selected as ETH1 reference Rx clock

__HAL_RCC_GET_ETH1RX_SOURCE

Description:

- Macro to get the ETH1 reference Rx clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ETH1RXCLKSOURCE_EXT External clock selected as ETH1 reference Rx clock
  - RCC_ETH1RXCLKSOURCE_INT Internal kernel selected as ETH1 reference Rx clock

__HAL_RCC_ETH1TX_CONFIG

Description:

- Macro to configure the ETH1 reference Tx RGMII 125MHz clock source.

Parameters:

- __ETH1TX_CLKSOURCE__: specifies clock source for ETH1 reference Tx This parameter can be one of the following values:
  - RCC_ETH1TXCLKSOURCE_EXT External clock selected as ETH1 reference Tx clock
  - RCC_ETH1TXCLKSOURCE_INT Internal kernel selected as ETH1 reference Tx clock

__HAL_RCC_GET_ETH1TX_SOURCE

Description:

- Macro to get the ETH1 reference Tx RGMII 125MHz clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ETH1TXCLKSOURCE_EXT External clock selected as ETH1 reference Tx clock
  - RCC_ETH1TXCLKSOURCE_INT Internal kernel selected as ETH1 reference Tx clock

__HAL_RCC_ETH1PTP_CONFIG

Description:

- Macro to configure the ETH1 PTP clock source.

Parameters:

- __ETH1PTP_CLKSOURCE__: specifies clock source for ETH1 PTP This parameter can be one of the following values:
  - RCC_ETH1PTPCLKSOURCE_HCLK HCLK selected as ETH1 PTP clock
  - RCC_ETH1PTPCLKSOURCE_CLKP CLKP selected as ETH1 PTP clock
  - RCC_ETH1PTPCLKSOURCE_IC13 IC13 selected as ETH1 PTP clock
  - RCC_ETH1PTPCLKSOURCE_HSE HSE selected as ETH1 PTP clock

__HAL_RCC_GET_ETH1PTP_SOURCE

Description:

- Macro to get the ETH1 PTP clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_ETH1PTPCLKSOURCE_HCLK HCLK selected as ETH1 PTP clock
  - RCC_ETH1PTPCLKSOURCE_CLKP CLKP selected as ETH1 PTP clock
  - RCC_ETH1PTPCLKSOURCE_IC13 IC13 selected as ETH1 PTP clock
  - RCC_ETH1PTPCLKSOURCE_HSE HSE selected as ETH1 PTP clock

__HAL_RCC_ETH1PTP_DIVIDER_CONFIG

Description:

- Macro to configure the ETH1 PTP divider.

Parameters:

- __ETH1PTP_DIVIDER__: specifies clock divider for ETH1 PTP This parameter can be a value between 1 and 16.

__HAL_RCC_GET_ETH1PTP_DIVIDER

Description:

- Macro to get the ETH1 PTP divider.

Return value:

- The: divider can be a value between 1 and 16.

__HAL_RCC_FDCAN_CONFIG

Description:

- Macro to configure the FDCAN kernel clock source.

Parameters:

- __FDCAN_CLKSOURCE__: specifies clock source for FDCAN kernel This parameter can be one of the following values:
  - RCC_FDCANCLKSOURCE_PCLK1 PCLK1 selected as FDCAN kernel clock (default)
  - RCC_FDCANCLKSOURCE_CLKP CLKP selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_IC19 IC19 selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_HSE HSE selected as FDCAN kernel clock

__HAL_RCC_GET_FDCAN_SOURCE

Description:

- Macro to get the FDCAN kernel clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_FDCANCLKSOURCE_PCLK1 PCLK1 selected as FDCAN kernel clock (default)
  - RCC_FDCANCLKSOURCE_CLKP CLKP selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_IC19 IC19 selected as FDCAN kernel clock
  - RCC_FDCANCLKSOURCE_HSE HSE selected as FDCAN kernel clock

__HAL_RCC_FMC_CONFIG

Description:

- Macro to configure the FMC clock source.

Parameters:

- __FMC_CLKSOURCE__: specifies the FMC clock source.
  - RCC_FMCCLKSOURCE_HCLK HCLK Clock selected as FMC clock
  - RCC_FMCCLKSOURCE_CLKP CLKP Clock selected as FMC clock
  - RCC_FMCCLKSOURCE_IC3 IC3 Clock selected as FMC clock
  - RCC_FMCCLKSOURCE_IC4 IC4 selected as FMC clock

__HAL_RCC_GET_FMC_SOURCE

Description:

- Macro to get the FMC clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_FMCCLKSOURCE_HCLK HCLK Clock selected as FMC clock
  - RCC_FMCCLKSOURCE_CLKP CLKP Clock selected as FMC clock
  - RCC_FMCCLKSOURCE_IC3 IC3 Clock selected as FMC clock
  - RCC_FMCCLKSOURCE_IC4 IC4 selected as FMC clock

__HAL_RCC_I2C1_CONFIG

Description:

- Macro to configure the I2C1 clock source.

Parameters:

- __I2C1_CLKSOURCE__: specifies the I2C1 clock source. This parameter can be one of the following values:
  - RCC_I2C1CLKSOURCE_PCLK1 PCLK1 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_CLKP CKLP selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_IC10 IC10 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_IC15 IC15 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_MSI MSI selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_HSI HSI selected as I2C1 clock

__HAL_RCC_GET_I2C1_SOURCE

Description:

- Macro to get the I2C1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C1CLKSOURCE_PCLK1 PCLK1 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_CLKP CKLP selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_IC10 IC10 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_IC15 IC15 selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_MSI MSI selected as I2C1 clock
  - RCC_I2C1CLKSOURCE_HSI HSI selected as I2C1 clock

__HAL_RCC_I2C2_CONFIG

Description:

- Macro to configure the I2C2 clock source.

Parameters:

- __I2C2_CLKSOURCE__: specifies the I2C2 clock source. This parameter can be one of the following values:
  - RCC_I2C2CLKSOURCE_PCLK1 PCLK1 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_CLKP CKLP selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_IC10 IC10 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_IC15 IC15 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_MSI MSI selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_HSI HSI selected as I2C2 clock

__HAL_RCC_GET_I2C2_SOURCE

Description:

- Macro to get the I2C2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C2CLKSOURCE_PCLK1 PCLK1 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_CLKP CKLP selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_IC10 IC10 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_IC15 IC15 selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_MSI MSI selected as I2C2 clock
  - RCC_I2C2CLKSOURCE_HSI HSI selected as I2C2 clock

__HAL_RCC_I2C3_CONFIG

Description:

- Macro to configure the I2C3 clock source.

Parameters:

- __I2C3_CLKSOURCE__: specifies the I2C3 clock source. This parameter can be one of the following values:
  - RCC_I2C3CLKSOURCE_PCLK1 PCLK1 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_CLKP CKLP selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_IC10 IC10 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_IC15 IC15 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_MSI MSI selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_HSI HSI selected as I2C3 clock

__HAL_RCC_GET_I2C3_SOURCE

Description:

- Macro to get the I2C3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C3CLKSOURCE_PCLK1 PCLK1 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_CLKP CKLP selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_IC10 IC10 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_IC15 IC15 selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_MSI MSI selected as I2C3 clock
  - RCC_I2C3CLKSOURCE_HSI HSI selected as I2C3 clock

__HAL_RCC_I2C4_CONFIG

Description:

- Macro to configure the I2C4 clock source.

Parameters:

- __I2C4_CLKSOURCE__: specifies the I2C4 clock source. This parameter can be one of the following values:
  - RCC_I2C4CLKSOURCE_PCLK1 PCLK1 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_CLKP CKLP selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_IC10 IC10 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_IC15 IC15 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_MSI MSI selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_HSI HSI selected as I2C4 clock

__HAL_RCC_GET_I2C4_SOURCE

Description:

- Macro to get the I2C4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I2C4CLKSOURCE_PCLK1 PCLK1 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_CLKP CKLP selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_IC10 IC10 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_IC15 IC15 selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_MSI MSI selected as I2C4 clock
  - RCC_I2C4CLKSOURCE_HSI HSI selected as I2C4 clock

__HAL_RCC_I3C1_CONFIG

Description:

- Macro to configure the I3C1 clock source.

Parameters:

- __I3C1_CLKSOURCE__: specifies the I3C1 clock source. This parameter can be one of the following values:
  - RCC_I3C1CLKSOURCE_PCLK1 PCLK1 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_CLKP CKLP selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_IC10 IC10 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_IC15 IC15 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_MSI MSI selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_HSI HSI selected as I3C1 clock

__HAL_RCC_GET_I3C1_SOURCE

Description:

- Macro to get the I3C1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I3C1CLKSOURCE_PCLK1 PCLK1 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_CLKP CKLP selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_IC10 IC10 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_IC15 IC15 selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_MSI MSI selected as I3C1 clock
  - RCC_I3C1CLKSOURCE_HSI HSI selected as I3C1 clock

__HAL_RCC_I3C2_CONFIG

Description:

- Macro to configure the I3C2 clock source.

Parameters:

- __I3C2_CLKSOURCE__: specifies the I3C2 clock source. This parameter can be one of the following values:
  - RCC_I3C2CLKSOURCE_PCLK1 PCLK1 selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_CLKP CKLP selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_IC10 IC10 selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_IC15 IC15 selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_MSI MSI selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_HSI HSI selected as I3C2 clock

__HAL_RCC_GET_I3C2_SOURCE

Description:

- Macro to get the I3C2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_I3C2CLKSOURCE_PCLK1 PCLK1 selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_CLKP CKLP selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_IC10 IC10 selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_IC15 IC15 selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_MSI MSI selected as I3C2 clock
  - RCC_I3C2CLKSOURCE_HSI HSI selected as I3C2 clock

__HAL_RCC_LPTIM1_CONFIG

Description:

- Macro to configure the LPTIM1 clock source.

Parameters:

- __LPTIM1_CLKSOURCE__: specifies the LPTIM1 clock source. This parameter can be one of the following values:
  - RCC_LPTIM1CLKSOURCE_PCLK1 PCLK1 clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_CLKP CLKP clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_IC15 IC15 clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_LSE LSE clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_LSI LSI clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_TIMG TIMG clock selected as LPTIM1 clock

__HAL_RCC_GET_LPTIM1_SOURCE

Description:

- Macro to get the LPTIM1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM1CLKSOURCE_PCLK1 PCLK1 clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_CLKP CLKP clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_IC15 IC15 clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_LSE LSE clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_LSI LSI clock selected as LPTIM1 clock
  - RCC_LPTIM1CLKSOURCE_TIMG TIMG clock selected as LPTIM1 clock

__HAL_RCC_LPTIM2_CONFIG

Description:

- Macro to configure the LPTIM2 clock source.

Parameters:

- __LPTIM2_CLKSOURCE__: specifies the LPTIM2 clock source. This parameter can be one of the following values:
  - RCC_LPTIM2CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_CLKP CLKP clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_IC15 IC15 clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_LSE LSE clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_LSI LSI clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_TIMG TIMG clock selected as LPTIM2 clock

__HAL_RCC_GET_LPTIM2_SOURCE

Description:

- Macro to get the LPTIM2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM2CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_CLKP CLKP clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_IC15 IC15 clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_LSE LSE clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_LSI LSI clock selected as LPTIM2 clock
  - RCC_LPTIM2CLKSOURCE_TIMG TIMG clock selected as LPTIM2 clock

__HAL_RCC_LPTIM3_CONFIG

Description:

- Macro to configure the LPTIM3 clock source.

Parameters:

- __LPTIM3_CLKSOURCE__: specifies the LPTIM3 clock source. This parameter can be one of the following values:
  - RCC_LPTIM3CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_CLKP CLKP clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_IC15 IC15 clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSE LSE clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSI LSI clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_TIMG TIMG clock selected as LPTIM3 clock

__HAL_RCC_GET_LPTIM3_SOURCE

Description:

- Macro to get the LPTIM3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM3CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_CLKP CLKP clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_IC15 IC15 clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSE LSE clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_LSI LSI clock selected as LPTIM3 clock
  - RCC_LPTIM3CLKSOURCE_TIMG TIMG clock selected as LPTIM3 clock

__HAL_RCC_LPTIM4_CONFIG

Description:

- Macro to configure the LPTIM4 clock source.

Parameters:

- __LPTIM4_CLKSOURCE__: specifies the LPTIM4 clock source. This parameter can be one of the following values:
  - RCC_LPTIM4CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_CLKP CLKP clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_IC15 IC15 clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSE LSE clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSI LSI clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_TIMG TIMG clock selected as LPTIM4 clock

__HAL_RCC_GET_LPTIM4_SOURCE

Description:

- Macro to get the LPTIM4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM4CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_CLKP CLKP clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_IC15 IC15 clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSE LSE clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_LSI LSI clock selected as LPTIM4 clock
  - RCC_LPTIM4CLKSOURCE_TIMG TIMG clock selected as LPTIM4 clock

__HAL_RCC_LPTIM5_CONFIG

Description:

- Macro to configure the LPTIM5 clock source.

Parameters:

- __LPTIM5_CLKSOURCE__: specifies the LPTIM5 clock source. This parameter can be one of the following values:
  - RCC_LPTIM5CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_CLKP CLKP clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_IC15 IC15 clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSE LSE clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSI LSI clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_TIMG TIMG clock selected as LPTIM5 clock

__HAL_RCC_GET_LPTIM5_SOURCE

Description:

- Macro to get the LPTIM5 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPTIM5CLKSOURCE_PCLK4 PCLK4 clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_CLKP CLKP clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_IC15 IC15 clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSE LSE clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_LSI LSI clock selected as LPTIM5 clock
  - RCC_LPTIM5CLKSOURCE_TIMG TIMG clock selected as LPTIM5 clock

__HAL_RCC_LPUART1_CONFIG

Description:

- Macro to configure the LPUART1 clock (LPUART1CLK).

Parameters:

- __LPUART1_CLKSOURCE__: specifies the LPUART1 clock source. This parameter can be one of the following values:
  - RCC_LPUART1CLKSOURCE_PCLK4 PCLK4 Clock selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_CLKP CLKP selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_IC9 IC9 selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_IC14 IC14 selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_LSE LSE selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_MSI MSI selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_HSI HSI selected as LPUART1 clock

__HAL_RCC_GET_LPUART1_SOURCE

Description:

- Macro to get the LPUART1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LPUART1CLKSOURCE_PCLK4 PCLK4 Clock selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_CLKP CLKP selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_IC9 IC9 selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_IC14 IC14 selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_LSE LSE selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_MSI MSI selected as LPUART1 clock
  - RCC_LPUART1CLKSOURCE_HSI HSI selected as LPUART1 clock

__HAL_RCC_LTDC_CONFIG

Description:

- Macro to configure the LTDC clock (LTDCCLK).

Parameters:

- __LTDC_CLKSOURCE__: specifies the LTDC clock source. This parameter can be one of the following values:
  - RCC_LTDCCLKSOURCE_PCLK5 PCLK5 Clock selected as LTDC clock
  - RCC_LTDCCLKSOURCE_CLKP CLKP selected as LTDC clock
  - RCC_LTDCCLKSOURCE_IC16 IC14 selected as LTDC clock
  - RCC_LTDCCLKSOURCE_HSI HSI selected as LTDC clock

__HAL_RCC_GET_LTDC_SOURCE

Description:

- Macro to get the LTDC clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_LTDCCLKSOURCE_PCLK5 PCLK5 Clock selected as LTDC clock
  - RCC_LTDCCLKSOURCE_CLKP CLKP selected as LTDC clock
  - RCC_LTDCCLKSOURCE_IC16 IC14 selected as LTDC clock
  - RCC_LTDCCLKSOURCE_HSI HSI selected as LTDC clock

__HAL_RCC_MDF1_CONFIG

Description:

- Macro to configure the MDF1 clock.

Parameters:

- __MDF1_CLKSOURCE__: specifies the MDF1 clock source. This parameter can be one of the following values:
  - RCC_MDF1CLKSOURCE_HCLK HCLK Clock selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_CLKP CLKP selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_IC7 IC7 selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_IC8 IC8 selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_MSI MSI selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_HSI HSI selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_PIN External I2S_CKIN selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_TIMG TIMG selected as MDF1 clock

__HAL_RCC_GET_MDF1_SOURCE

Description:

- Macro to get the MDF1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_MDF1CLKSOURCE_HCLK HCLK Clock selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_CLKP CLKP selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_IC7 IC7 selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_IC8 IC8 selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_MSI MSI selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_HSI HSI selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_PIN External I2S_CKIN selected as MDF1 clock
  - RCC_MDF1CLKSOURCE_TIMG TIMG selected as MDF1 clock

__HAL_RCC_PSSI_CONFIG

Description:

- Macro to configure the PSSI clock source.

Parameters:

- __PSSI_CLKSOURCE__: defines the PSSI clock source. This parameter can be one of the following values:
  - RCC_PSSICLKSOURCE_HCLK HCLK selected as PSSI clock
  - RCC_PSSICLKSOURCE_CLKP Peripheral clock CLKP selected as PSSI clock
  - RCC_PSSICLKSOURCE_IC20 IC20 selected as PSSI clock
  - RCC_PSSICLKSOURCE_HSI HSI selected as PSSI clock

Return value:

- None

__HAL_RCC_GET_PSSI_SOURCE

Description:

- Macro to get the PSSI clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_PSSICLKSOURCE_HCLK HCLK selected as PSSI clock
  - RCC_PSSICLKSOURCE_CLKP Peripheral clock CLKP selected as PSSI clock
  - RCC_PSSICLKSOURCE_IC20 IC20 selected as PSSI clock
  - RCC_PSSICLKSOURCE_HSI HSI selected as PSSI clock

__HAL_RCC_SAI1_CONFIG

Description:

- Macro to configure the SAI1 clock source.

Parameters:

- __SAI1_CLKSOURCE__: defines the SAI1 clock source. This parameter can be one of the following values:
  - RCC_SAI1CLKSOURCE_PCLK2 PCLK2 Clock selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_CLKP Peripheral clock CLKP selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_IC7 IC7 selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_IC8 IC8 selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_MSI MSI selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_HSI HSI selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PIN External I2S_CKIN selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_SPDIFRX1 SPDIFRX1 selected as SAI1 clock

Return value:

- None

__HAL_RCC_GET_SAI1_SOURCE

Description:

- Macro to get the SAI1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SAI1CLKSOURCE_PCLK2 PCLK2 Clock selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_CLKP Peripheral clock CLKP selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_IC7 IC7 selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_IC8 IC8 selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_MSI MSI selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_HSI HSI selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_PIN External I2S_CKIN selected as SAI1 clock
  - RCC_SAI1CLKSOURCE_SPDIFRX1 SPDIFRX1 selected as SAI1 clock

__HAL_RCC_SAI2_CONFIG

Description:

- Macro to configure the SAI2 clock source.

Parameters:

- __SAI2_CLKSOURCE__: defines the SAI2 clock source. This parameter can be one of the following values:
  - RCC_SAI2CLKSOURCE_PCLK2 PCLK2 Clock selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_CLKP Peripheral clock CLKP selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_IC7 IC7 selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_IC8 IC8 selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_MSI MSI selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_HSI HSI selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PIN External I2S_CKIN selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_SPDIFRX1 SPDIFRX1 selected as SAI2 clock

Return value:

- None

__HAL_RCC_GET_SAI2_SOURCE

Description:

- Macro to get the SAI2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SAI2CLKSOURCE_PCLK2 PCLK2 Clock selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_CLKP Peripheral clock CLKP selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_IC7 IC7 selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_IC8 IC8 selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_MSI MSI selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_HSI HSI selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_PIN External I2S_CKIN selected as SAI2 clock
  - RCC_SAI2CLKSOURCE_SPDIFRX1 SPDIFRX1 selected as SAI2 clock

__HAL_RCC_SDMMC1_CONFIG

Description:

- Macro to configure the SDMMC1 kernel clock source.

Parameters:

- __SDMMC1_CLKSOURCE__: specifies clock source for SDMMC1 This parameter can be one of the following values:
  - RCC_SDMMC1CLKSOURCE_HCLK HCLK Clock selected as SDMMC1 kernel clock
  - RCC_SDMMC1CLKSOURCE_CLKP Peripheral clock CLKP selected as SDMMC1 kernel clock
  - RCC_SDMMC1CLKSOURCE_IC4 IC4 selected as SDMMC1 kernel clock
  - RCC_SDMMC1CLKSOURCE_IC5 IC5 selected as SDMMC1 kernel clock

__HAL_RCC_GET_SDMMC1_SOURCE

Description:

- Macro to get the SDMMC1 kernel clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SDMMC1CLKSOURCE_HCLK HCLK Clock selected as SDMMC1 kernel clock
  - RCC_SDMMC1CLKSOURCE_CLKP Peripheral clock CLKP selected as SDMMC1 kernel clock
  - RCC_SDMMC1CLKSOURCE_IC4 IC4 selected as SDMMC1 kernel clock
  - RCC_SDMMC1CLKSOURCE_IC5 IC5 selected as SDMMC1 kernel clock

__HAL_RCC_SDMMC2_CONFIG

Description:

- Macro to configure the SDMMC2 kernel clock source.

Parameters:

- __SDMMC2_CLKSOURCE__: specifies clock source for SDMMC2 This parameter can be one of the following values:
  - RCC_SDMMC2CLKSOURCE_HCLK HCLK Clock selected as SDMMC2 kernel clock
  - RCC_SDMMC2CLKSOURCE_CLKP Peripheral clock CLKP selected as SDMMC2 kernel clock
  - RCC_SDMMC2CLKSOURCE_IC4 IC4 selected as SDMMC2 kernel clock
  - RCC_SDMMC2CLKSOURCE_IC5 IC5 selected as SDMMC2 kernel clock

__HAL_RCC_GET_SDMMC2_SOURCE

Description:

- Macro to get the SDMMC2 kernel clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SDMMC2CLKSOURCE_HCLK HCLK Clock selected as SDMMC2 kernel clock
  - RCC_SDMMC2CLKSOURCE_CLKP Peripheral clock CLKP selected as SDMMC2 kernel clock
  - RCC_SDMMC2CLKSOURCE_IC4 IC4 selected as SDMMC2 kernel clock
  - RCC_SDMMC2CLKSOURCE_IC5 IC5 selected as SDMMC2 kernel clock

__HAL_RCC_SPDIFRX1_CONFIG

Description:

- Macro to Configure the SPDIFRX1 clock source.

Parameters:

- __SPDIFRX_CLKSOURCE__: defines the SPDIFRX1 clock source. This parameter can be one of the following values:
  - RCC_SPDIFRX1CLKSOURCE_PCLK1 PCLK1 Clock selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_CLKP Peripheral clock CLKP selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_IC7 IC7 selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_IC8 IC8 selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_MSI MSI selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_HSI HSI selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_PIN External I2S_CKIN selected as SPDIFRX1 clock

Return value:

- None

__HAL_RCC_GET_SPDIFRX1_SOURCE

Description:

- Macro to get the SPDIFRX1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPDIFRX1CLKSOURCE_PCLK1 PCLK1 Clock selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_CLKP Peripheral clock CLKP selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_IC7 IC7 selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_IC8 IC8 selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_MSI MSI selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_HSI HSI selected as SPDIFRX1 clock
  - RCC_SPDIFRX1CLKSOURCE_PIN External I2S_CKIN selected as SPDIFRX1 clock
- None

__HAL_RCC_SPI1_CONFIG

Description:

- Macro to configure the SPI1 clock source.

Parameters:

- __SPI1_CLKSOURCE__: defines the SPI1 clock source. This parameter can be one of the following values:
  - RCC_SPI1CLKSOURCE_PCLK2 PCLK2 selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_IC8 IC8 selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_IC9 IC9 selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_MSI MSI selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_HSI HSI selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_PIN External I2S_CKIN selected as SPI1 clock

Return value:

- None

__HAL_RCC_GET_SPI1_SOURCE

Description:

- Macro to get the SPI1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI1CLKSOURCE_PCLK2 PCLK2 selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_IC8 IC8 selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_IC9 IC9 selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_MSI MSI selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_HSI HSI selected as SPI1 clock
  - RCC_SPI1CLKSOURCE_PIN External I2S_CKIN selected as SPI1 clock

__HAL_RCC_SPI2_CONFIG

Description:

- Macro to configure the SPI2 clock source.

Parameters:

- __SPI2_CLKSOURCE__: defines the SPI2 clock source. This parameter can be one of the following values:
  - RCC_SPI2CLKSOURCE_PCLK1 PCLK1 selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_IC8 IC8 selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_IC9 IC9 selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_MSI MSI selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_HSI HSI selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_PIN External I2S_CKIN selected as SPI2 clock

Return value:

- None

__HAL_RCC_GET_SPI2_SOURCE

Description:

- Macro to get the SPI2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI2CLKSOURCE_PCLK1 PCLK1 selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_IC8 IC8 selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_IC9 IC9 selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_MSI MSI selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_HSI HSI selected as SPI2 clock
  - RCC_SPI2CLKSOURCE_PIN External I2S_CKIN selected as SPI2 clock

__HAL_RCC_SPI3_CONFIG

Description:

- Macro to configure the SPI3 clock source.

Parameters:

- __SPI3_CLKSOURCE__: defines the SPI3 clock source. This parameter can be one of the following values:
  - RCC_SPI3CLKSOURCE_PCLK1 PCLK1 selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_IC8 IC8 selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_IC9 IC9 selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_MSI MSI selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_HSI HSI selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_PIN External I2S_CKIN selected as SPI3 clock

Return value:

- None

__HAL_RCC_GET_SPI3_SOURCE

Description:

- Macro to get the SPI3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI3CLKSOURCE_PCLK1 PCLK1 selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_IC8 IC8 selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_IC9 IC9 selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_MSI MSI selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_HSI HSI selected as SPI3 clock
  - RCC_SPI3CLKSOURCE_PIN External I2S_CKIN selected as SPI3 clock

__HAL_RCC_SPI4_CONFIG

Description:

- Macro to configure the SPI4 clock source.

Parameters:

- __SPI4_CLKSOURCE__: defines the SPI4 clock source. This parameter can be one of the following values:
  - RCC_SPI4CLKSOURCE_PCLK2 PCLK2 selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_IC8 IC8 selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_IC9 IC9 selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_MSI MSI selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_HSI HSI selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_PIN External I2S_CKIN selected as SPI4 clock

Return value:

- None

__HAL_RCC_GET_SPI4_SOURCE

Description:

- Macro to get the SPI4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI4CLKSOURCE_PCLK2 PCLK2 selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_IC8 IC8 selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_IC9 IC9 selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_MSI MSI selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_HSI HSI selected as SPI4 clock
  - RCC_SPI4CLKSOURCE_PIN External I2S_CKIN selected as SPI4 clock

__HAL_RCC_SPI5_CONFIG

Description:

- Macro to configure the SPI5 clock source.

Parameters:

- __SPI5_CLKSOURCE__: defines the SPI5 clock source. This parameter can be one of the following values:
  - RCC_SPI5CLKSOURCE_PCLK2 PCLK2 selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_IC8 IC8 selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_IC9 IC9 selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_MSI MSI selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_HSI HSI selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_PIN External I2S_CKIN selected as SPI5 clock

Return value:

- None

__HAL_RCC_GET_SPI5_SOURCE

Description:

- Macro to get the SPI5 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI5CLKSOURCE_PCLK2 PCLK2 selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_IC8 IC8 selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_IC9 IC9 selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_MSI MSI selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_HSI HSI selected as SPI5 clock
  - RCC_SPI5CLKSOURCE_PIN External I2S_CKIN selected as SPI5 clock

__HAL_RCC_SPI6_CONFIG

Description:

- Macro to configure the SPI6 clock source.

Parameters:

- __SPI6_CLKSOURCE__: defines the SPI6 clock source. This parameter can be one of the following values:
  - RCC_SPI6CLKSOURCE_PCLK4 PCLK4 selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_IC8 IC8 selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_IC9 IC9 selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_MSI MSI selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_HSI HSI selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_PIN External I2S_CKIN selected as SPI6 clock

Return value:

- None

__HAL_RCC_GET_SPI6_SOURCE

Description:

- Macro to get the SPI6 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_SPI6CLKSOURCE_PCLK4 PCLK4 selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_CLKP Peripheral clock CKLP selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_IC8 IC8 selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_IC9 IC9 selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_MSI MSI selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_HSI HSI selected as SPI6 clock
  - RCC_SPI6CLKSOURCE_PIN External I2S_CKIN selected as SPI6 clock

__HAL_RCC_USART1_CONFIG

Description:

- Macro to configure the USART1 clock source.

Parameters:

- __USART1_CLKSOURCE__: specifies the USART1 clock source. This parameter can be one of the following values:
  - RCC_USART1CLKSOURCE_PCLK2 PCLK2 selected as USART1 clock
  - RCC_USART1CLKSOURCE_CLKP Peripheral clock CKLP selected as USART1 clock
  - RCC_USART1CLKSOURCE_IC9 IC9 selected as USART1 clock
  - RCC_USART1CLKSOURCE_IC14 IC14 selected as USART1 clock
  - RCC_USART1CLKSOURCE_LSE LSE selected as USART1 clock
  - RCC_USART1CLKSOURCE_MSI MSI selected as USART1 clock
  - RCC_USART1CLKSOURCE_HSI HSI selected as USART1 clock

__HAL_RCC_GET_USART1_SOURCE

Description:

- Macro to get the USART1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART1CLKSOURCE_PCLK2 PCLK2 selected as USART1 clock
  - RCC_USART1CLKSOURCE_CLKP Peripheral clock CKLP selected as USART1 clock
  - RCC_USART1CLKSOURCE_IC9 IC9 selected as USART1 clock
  - RCC_USART1CLKSOURCE_IC14 IC14 selected as USART1 clock
  - RCC_USART1CLKSOURCE_LSE LSE selected as USART1 clock
  - RCC_USART1CLKSOURCE_MSI MSI selected as USART1 clock
  - RCC_USART1CLKSOURCE_HSI HSI selected as USART1 clock

__HAL_RCC_USART2_CONFIG

Description:

- Macro to configure the USART2 clock source.

Parameters:

- __USART2_CLKSOURCE__: specifies the USART2 clock source. This parameter can be one of the following values:
  - RCC_USART2CLKSOURCE_PCLK1 PCLK1 selected as USART2 clock
  - RCC_USART2CLKSOURCE_CLKP Peripheral clock CKLP selected as USART2 clock
  - RCC_USART2CLKSOURCE_IC9 IC9 selected as USART2 clock
  - RCC_USART2CLKSOURCE_IC14 IC14 selected as USART2 clock
  - RCC_USART2CLKSOURCE_LSE LSE selected as USART2 clock
  - RCC_USART2CLKSOURCE_MSI MSI selected as USART2 clock
  - RCC_USART2CLKSOURCE_HSI HSI selected as USART2 clock

__HAL_RCC_GET_USART2_SOURCE

Description:

- Macro to get the USART2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART2CLKSOURCE_PCLK1 PCLK1 selected as USART2 clock
  - RCC_USART2CLKSOURCE_CLKP Peripheral clock CKLP selected as USART2 clock
  - RCC_USART2CLKSOURCE_IC9 IC9 selected as USART2 clock
  - RCC_USART2CLKSOURCE_IC14 IC14 selected as USART2 clock
  - RCC_USART2CLKSOURCE_LSE LSE selected as USART2 clock
  - RCC_USART2CLKSOURCE_MSI MSI selected as USART2 clock
  - RCC_USART2CLKSOURCE_HSI HSI selected as USART2 clock

__HAL_RCC_USART3_CONFIG

Description:

- Macro to configure the USART3 clock source.

Parameters:

- __USART3_CLKSOURCE__: specifies the USART3 clock source. This parameter can be one of the following values:
  - RCC_USART3CLKSOURCE_PCLK1 PCLK1 selected as USART3 clock
  - RCC_USART3CLKSOURCE_CLKP Peripheral clock CKLP selected as USART3 clock
  - RCC_USART3CLKSOURCE_IC9 IC9 selected as USART3 clock
  - RCC_USART3CLKSOURCE_IC14 IC14 selected as USART3 clock
  - RCC_USART3CLKSOURCE_LSE LSE selected as USART3 clock
  - RCC_USART3CLKSOURCE_MSI MSI selected as USART3 clock
  - RCC_USART3CLKSOURCE_HSI HSI selected as USART3 clock

__HAL_RCC_GET_USART3_SOURCE

Description:

- Macro to get the USART3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART3CLKSOURCE_PCLK1 PCLK1 selected as USART3 clock
  - RCC_USART3CLKSOURCE_CLKP Peripheral clock CKLP selected as USART3 clock
  - RCC_USART3CLKSOURCE_IC9 IC9 selected as USART3 clock
  - RCC_USART3CLKSOURCE_IC14 IC14 selected as USART3 clock
  - RCC_USART3CLKSOURCE_LSE LSE selected as USART3 clock
  - RCC_USART3CLKSOURCE_MSI MSI selected as USART3 clock
  - RCC_USART3CLKSOURCE_HSI HSI selected as USART3 clock

__HAL_RCC_UART4_CONFIG

Description:

- Macro to configure the UART4 clock source.

Parameters:

- __UART4_CLKSOURCE__: specifies the UART4 clock source. This parameter can be one of the following values:
  - RCC_UART4CLKSOURCE_PCLK1 PCLK1 selected as UART4 clock
  - RCC_UART4CLKSOURCE_CLKP Peripheral clock CKLP selected as UART4 clock
  - RCC_UART4CLKSOURCE_IC9 IC9 selected as UART4 clock
  - RCC_UART4CLKSOURCE_IC14 IC14 selected as UART4 clock
  - RCC_UART4CLKSOURCE_LSE LSE selected as UART4 clock
  - RCC_UART4CLKSOURCE_MSI MSI selected as UART4 clock
  - RCC_UART4CLKSOURCE_HSI HSI selected as UART4 clock

__HAL_RCC_GET_UART4_SOURCE

Description:

- Macro to get the UART4 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART4CLKSOURCE_PCLK1 PCLK1 selected as UART4 clock
  - RCC_UART4CLKSOURCE_CLKP Peripheral clock CKLP selected as UART4 clock
  - RCC_UART4CLKSOURCE_IC9 IC9 selected as UART4 clock
  - RCC_UART4CLKSOURCE_IC14 IC14 selected as UART4 clock
  - RCC_UART4CLKSOURCE_LSE LSE selected as UART4 clock
  - RCC_UART4CLKSOURCE_MSI MSI selected as UART4 clock
  - RCC_UART4CLKSOURCE_HSI HSI selected as UART4 clock

__HAL_RCC_UART5_CONFIG

Description:

- Macro to configure the UART5 clock source.

Parameters:

- __UART5_CLKSOURCE__: specifies the UART5 clock source. This parameter can be one of the following values:
  - RCC_UART5CLKSOURCE_PCLK1 PCLK1 selected as UART5 clock
  - RCC_UART5CLKSOURCE_CLKP Peripheral clock CKLP selected as UART5 clock
  - RCC_UART5CLKSOURCE_IC9 IC9 selected as UART5 clock
  - RCC_UART5CLKSOURCE_IC14 IC14 selected as UART5 clock
  - RCC_UART5CLKSOURCE_LSE LSE selected as UART5 clock
  - RCC_UART5CLKSOURCE_MSI MSI selected as UART5 clock
  - RCC_UART5CLKSOURCE_HSI HSI selected as UART5 clock

__HAL_RCC_GET_UART5_SOURCE

Description:

- Macro to get the UART5 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART5CLKSOURCE_PCLK1 PCLK1 selected as UART5 clock
  - RCC_UART5CLKSOURCE_CLKP Peripheral clock CKLP selected as UART5 clock
  - RCC_UART5CLKSOURCE_IC9 IC9 selected as UART5 clock
  - RCC_UART5CLKSOURCE_IC14 IC14 selected as UART5 clock
  - RCC_UART5CLKSOURCE_LSE LSE selected as UART5 clock
  - RCC_UART5CLKSOURCE_MSI MSI selected as UART5 clock
  - RCC_UART5CLKSOURCE_HSI HSI selected as UART5 clock

__HAL_RCC_USART6_CONFIG

Description:

- Macro to configure the USART6 clock source.

Parameters:

- __USART6_CLKSOURCE__: specifies the USART6 clock source. This parameter can be one of the following values:
  - RCC_USART6CLKSOURCE_PCLK2 PCLK2 selected as USART6 clock
  - RCC_USART6CLKSOURCE_CLKP Peripheral clock CKLP selected as USART6 clock
  - RCC_USART6CLKSOURCE_IC9 IC9 selected as USART6 clock
  - RCC_USART6CLKSOURCE_IC14 IC14 selected as USART6 clock
  - RCC_USART6CLKSOURCE_LSE LSE selected as USART6 clock
  - RCC_USART6CLKSOURCE_MSI MSI selected as USART6 clock
  - RCC_USART6CLKSOURCE_HSI HSI selected as USART6 clock

__HAL_RCC_GET_USART6_SOURCE

Description:

- Macro to get the USART6 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART6CLKSOURCE_PCLK2 PCLK2 selected as USART6 clock
  - RCC_USART6CLKSOURCE_CLKP Peripheral clock CKLP selected as USART6 clock
  - RCC_USART6CLKSOURCE_IC9 IC9 selected as USART6 clock
  - RCC_USART6CLKSOURCE_IC14 IC14 selected as USART6 clock
  - RCC_USART6CLKSOURCE_LSE LSE selected as USART6 clock
  - RCC_USART6CLKSOURCE_MSI MSI selected as USART6 clock
  - RCC_USART6CLKSOURCE_HSI HSI selected as USART6 clock

__HAL_RCC_UART7_CONFIG

Description:

- Macro to configure the UART7 clock source.

Parameters:

- __UART7_CLKSOURCE__: specifies the UART7 clock source. This parameter can be one of the following values:
  - RCC_UART7CLKSOURCE_PCLK1 PCLK1 selected as UART7 clock
  - RCC_UART7CLKSOURCE_CLKP Peripheral clock CKLP selected as UART7 clock
  - RCC_UART7CLKSOURCE_IC9 IC9 selected as UART7 clock
  - RCC_UART7CLKSOURCE_IC14 IC14 selected as UART7 clock
  - RCC_UART7CLKSOURCE_LSE LSE selected as UART7 clock
  - RCC_UART7CLKSOURCE_MSI MSI selected as UART7 clock
  - RCC_UART7CLKSOURCE_HSI HSI selected as UART7 clock

__HAL_RCC_GET_UART7_SOURCE

Description:

- Macro to get the UART7 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART7CLKSOURCE_PCLK1 PCLK1 selected as UART7 clock
  - RCC_UART7CLKSOURCE_CLKP Peripheral clock CKLP selected as UART7 clock
  - RCC_UART7CLKSOURCE_IC9 IC9 selected as UART7 clock
  - RCC_UART7CLKSOURCE_IC14 IC14 selected as UART7 clock
  - RCC_UART7CLKSOURCE_LSE LSE selected as UART7 clock
  - RCC_UART7CLKSOURCE_MSI MSI selected as UART7 clock
  - RCC_UART7CLKSOURCE_HSI HSI selected as UART7 clock

__HAL_RCC_UART8_CONFIG

Description:

- Macro to configure the UART8 clock source.

Parameters:

- __UART8_CLKSOURCE__: specifies the UART8 clock source. This parameter can be one of the following values:
  - RCC_UART8CLKSOURCE_PCLK1 PCLK1 selected as UART8 clock
  - RCC_UART8CLKSOURCE_CLKP Peripheral clock CKLP selected as UART8 clock
  - RCC_UART8CLKSOURCE_IC9 IC9 selected as UART8 clock
  - RCC_UART8CLKSOURCE_IC14 IC14 selected as UART8 clock
  - RCC_UART8CLKSOURCE_LSE LSE selected as UART8 clock
  - RCC_UART8CLKSOURCE_MSI MSI selected as UART8 clock
  - RCC_UART8CLKSOURCE_HSI HSI selected as UART8 clock

__HAL_RCC_GET_UART8_SOURCE

Description:

- Macro to get the UART8 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART8CLKSOURCE_PCLK1 PCLK1 selected as UART8 clock
  - RCC_UART8CLKSOURCE_CLKP Peripheral clock CKLP selected as UART8 clock
  - RCC_UART8CLKSOURCE_IC9 IC9 selected as UART8 clock
  - RCC_UART8CLKSOURCE_IC14 IC14 selected as UART8 clock
  - RCC_UART8CLKSOURCE_LSE LSE selected as UART8 clock
  - RCC_UART8CLKSOURCE_MSI MSI selected as UART8 clock
  - RCC_UART8CLKSOURCE_HSI HSI selected as UART8 clock

__HAL_RCC_UART9_CONFIG

Description:

- Macro to configure the UART9 clock source.

Parameters:

- __UART9_CLKSOURCE__: specifies the UART9 clock source. This parameter can be one of the following values:
  - RCC_UART9CLKSOURCE_PCLK2 PCLK2 selected as UART9 clock
  - RCC_UART9CLKSOURCE_CLKP Peripheral clock CKLP selected as UART9 clock
  - RCC_UART9CLKSOURCE_IC9 IC9 selected as UART9 clock
  - RCC_UART9CLKSOURCE_IC14 IC14 selected as UART9 clock
  - RCC_UART9CLKSOURCE_LSE LSE selected as UART9 clock
  - RCC_UART9CLKSOURCE_MSI MSI selected as UART9 clock
  - RCC_UART9CLKSOURCE_HSI HSI selected as UART9 clock

__HAL_RCC_GET_UART9_SOURCE

Description:

- Macro to get the UART9 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_UART9CLKSOURCE_PCLK2 PCLK2 selected as UART9 clock
  - RCC_UART9CLKSOURCE_CLKP Peripheral clock CKLP selected as UART9 clock
  - RCC_UART9CLKSOURCE_IC9 IC9 selected as UART9 clock
  - RCC_UART9CLKSOURCE_IC14 IC14 selected as UART9 clock
  - RCC_UART9CLKSOURCE_LSE LSE selected as UART9 clock
  - RCC_UART9CLKSOURCE_MSI MSI selected as UART9 clock
  - RCC_UART9CLKSOURCE_HSI HSI selected as UART9 clock

__HAL_RCC_USART10_CONFIG

Description:

- Macro to configure the USART10 clock source.

Parameters:

- __USART10_CLKSOURCE__: specifies the USART10 clock source. This parameter can be one of the following values:
  - RCC_USART10CLKSOURCE_PCLK2 PCLK2 selected as USART10 clock
  - RCC_USART10CLKSOURCE_CLKP Peripheral clock CKLP selected as USART10 clock
  - RCC_USART10CLKSOURCE_IC9 IC9 selected as USART10 clock
  - RCC_USART10CLKSOURCE_IC14 IC14 selected as USART10 clock
  - RCC_USART10CLKSOURCE_LSE LSE selected as USART10 clock
  - RCC_USART10CLKSOURCE_MSI MSI selected as USART10 clock
  - RCC_USART10CLKSOURCE_HSI HSI selected as USART10 clock

__HAL_RCC_GET_USART10_SOURCE

Description:

- Macro to get the USART10 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USART10CLKSOURCE_PCLK2 PCLK2 selected as USART10 clock
  - RCC_USART10CLKSOURCE_CLKP Peripheral clock CKLP selected as USART10 clock
  - RCC_USART10CLKSOURCE_IC9 IC9 selected as USART10 clock
  - RCC_USART10CLKSOURCE_IC14 IC14 selected as USART10 clock
  - RCC_USART10CLKSOURCE_LSE LSE selected as USART10 clock
  - RCC_USART10CLKSOURCE_MSI MSI selected as USART10 clock
  - RCC_USART10CLKSOURCE_HSI HSI selected as USART10 clock

__HAL_RCC_XSPI1_CONFIG

Description:

- Macro to configure the XSPI1 clock source.

Parameters:

- __XSPI1_CLKSOURCE__: specifies the XSPI1 clock source.
  - RCC_XSPI1CLKSOURCE_HCLK HCLK selected as XSPI1 clock
  - RCC_XSPI1CLKSOURCE_CLKP Peripheral clock CKLP selected as XSPI1 clock
  - RCC_XSPI1CLKSOURCE_IC3 IC3 selected as XSPI1 clock
  - RCC_XSPI1CLKSOURCE_IC4 IC4 selected as XSPI1 clock

__HAL_RCC_GET_XSPI1_SOURCE

Description:

- Macro to get the XSPI1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_XSPI1CLKSOURCE_HCLK HCLK selected as XSPI1 clock
  - RCC_XSPI1CLKSOURCE_CLKP Peripheral clock CKLP selected as XSPI1 clock
  - RCC_XSPI1CLKSOURCE_IC3 IC3 selected as XSPI1 clock
  - RCC_XSPI1CLKSOURCE_IC4 IC4 selected as XSPI1 clock

__HAL_RCC_XSPI2_CONFIG

Description:

- Macro to configure the XSPI2 clock source.

Parameters:

- __XSPI2_CLKSOURCE__: specifies the XSPI2 clock source.
  - RCC_XSPI2CLKSOURCE_HCLK HCLK selected as XSPI2 clock
  - RCC_XSPI2CLKSOURCE_CLKP Peripheral clock CKLP selected as XSPI2 clock
  - RCC_XSPI2CLKSOURCE_IC3 IC3 selected as XSPI2 clock
  - RCC_XSPI2CLKSOURCE_IC4 IC4 selected as XSPI2 clock

__HAL_RCC_GET_XSPI2_SOURCE

Description:

- Macro to get the XSPI2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_XSPI2CLKSOURCE_HCLK HCLK selected as XSPI2 clock
  - RCC_XSPI2CLKSOURCE_CLKP Peripheral clock CKLP selected as XSPI2 clock
  - RCC_XSPI2CLKSOURCE_IC3 IC3 selected as XSPI2 clock
  - RCC_XSPI2CLKSOURCE_IC4 IC4 selected as XSPI2 clock

__HAL_RCC_XSPI3_CONFIG

Description:

- Macro to configure the XSPI3 clock source.

Parameters:

- __XSPI3_CLKSOURCE__: specifies the XSPI3 clock source.
  - RCC_XSPI3CLKSOURCE_HCLK HCLK selected as XSPI3 clock
  - RCC_XSPI3CLKSOURCE_CLKP Peripheral clock CKLP selected as XSPI3 clock
  - RCC_XSPI3CLKSOURCE_IC3 IC3 selected as XSPI3 clock
  - RCC_XSPI3CLKSOURCE_IC4 IC4 selected as XSPI3 clock

__HAL_RCC_GET_XSPI3_SOURCE

Description:

- Macro to get the XSPI3 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_XSPI3CLKSOURCE_HCLK HCLK selected as XSPI3 clock
  - RCC_XSPI3CLKSOURCE_CLKP Peripheral clock CKLP selected as XSPI3 clock
  - RCC_XSPI3CLKSOURCE_IC3 IC3 selected as XSPI3 clock
  - RCC_XSPI3CLKSOURCE_IC4 IC4 selected as XSPI3 clock

__HAL_RCC_TIMCLKPRESCALER_CONFIG

Description:

- Macro to configure the Timers clocks prescaler.

Parameters:

- __PRESC__: specifies the Timers clocks prescaler selection This parameter can be one of the following values:
  - RCC_TIMPRES_DIV1 The Timers kernels clocks prescaler is 1
  - RCC_TIMPRES_DIV2 The Timers kernels clocks prescaler is 2
  - RCC_TIMPRES_DIV4 The Timers kernels clocks prescaler is 4
  - RCC_TIMPRES_DIV8 The Timers kernels clocks prescaler is 8

__HAL_RCC_GET_TIMCLKPRESCALER

Description:

- Macro to get the Timers clocks prescaler.

Return value:

- Timers: clocks prescaler can be one of the following values:
  - RCC_TIMPRES_DIV1 The Timers kernels clocks prescaler is 1
  - RCC_TIMPRES_DIV2 The Timers kernels clocks prescaler is 2
  - RCC_TIMPRES_DIV4 The Timers kernels clocks prescaler is 4
  - RCC_TIMPRES_DIV8 The Timers kernels clocks prescaler is 8

__HAL_RCC_USBPHY1_CONFIG

Description:

- Macro to configure the USBPHY1 clock.

Parameters:

- __USBPHY1_CLKSOURCE__: specifies the USBPHY1 clock source. This parameter can be one of the following values:
  - RCC_USBPHY1REFCLKSOURCE_OTGPHY1 USB OTGPHY1 kernel clock selected as USBPHY1 clock
  - RCC_USBPHY1REFCLKSOURCE_HSE_DIRECT HSE from oscillator selected as USBPHY1 clock
  - RCC_USBPHY1REFCLKSOURCE_HSE_DIRECT_DIV2 HSE from oscillator divided by 2 selected as USBPHY1 clock

__HAL_RCC_GET_USBPHY1_SOURCE

Description:

- Macro to get the USBPHY1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USBPHY1REFCLKSOURCE_OTGPHY1 USB OTGPHY1 kernel clock selected as USBPHY1 clock
  - RCC_USBPHY1REFCLKSOURCE_HSE_DIRECT HSE from oscillator selected as USBPHY1 clock
  - RCC_USBPHY1REFCLKSOURCE_HSE_DIRECT_DIV2 HSE from oscillator divided by 2 selected as USBPHY1 clock

__HAL_RCC_USBPHY2_CONFIG

Description:

- Macro to configure the USBPHY2 clock.

Parameters:

- __USBPHY2_CLKSOURCE__: specifies the USBPHY2 clock source. This parameter can be one of the following values:
  - RCC_USBPHY2REFCLKSOURCE_OTGPHY2 USB OTGPHY2 kernel clock selected as USBPHY2 clock
  - RCC_USBPHY2REFCLKSOURCE_HSE_DIRECT HSE from oscillator selected as USBPHY2 clock
  - RCC_USBPHY2REFCLKSOURCE_HSE_DIRECT_DIV2 HSE from oscillator divided by 2 selected as USBPHY2 clock

__HAL_RCC_GET_USBPHY2_SOURCE

Description:

- Macro to get the USBPHY2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USBPHY2REFCLKSOURCE_OTGPHY2 USB OTGPHY2 kernel clock selected as USBPHY2 clock
  - RCC_USBPHY2REFCLKSOURCE_HSE_DIRECT HSE from oscillator selected as USBPHY2 clock
  - RCC_USBPHY2REFCLKSOURCE_HSE_DIRECT_DIV2 HSE from oscillator divided by 2 selected as USBPHY2 clock

__HAL_RCC_USBOTGHS1_CONFIG

Description:

- Macro to configure the USB OTGHS1 clock.

Parameters:

- __USBOTGHS1_CLKSOURCE__: specifies the USB OTGHS1 clock source. This parameter can be one of the following values:
  - RCC_USBOTGHS1CLKSOURCE_HSE_DIV2 HSE divided by 2 selected as USBOTGHS1 clock
  - RCC_USBOTGHS1CLKSOURCE_CLKP Peripheral clock CKLP selected as USBOTGHS1 clock
  - RCC_USBOTGHS1CLKSOURCE_IC15 IC15 selected as USBOTGHS1 clock
  - RCC_USBOTGHS1CLKSOURCE_HSE_DIV_2_OSC HSE divided by 2 from oscillator selected as USBOTGHS1 clock

__HAL_RCC_GET_USBOTGHS1_SOURCE

Description:

- Macro to get the USB OTGHS1 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USBOTGHS1CLKSOURCE_HSE_DIV2 HSE divided by 2 selected as USBOTGHS1 clock
  - RCC_USBOTGHS1CLKSOURCE_CLKP Peripheral clock CKLP selected as USBOTGHS1 clock
  - RCC_USBOTGHS1CLKSOURCE_IC15 IC15 selected as USBOTGHS1 clock
  - RCC_USBOTGHS1CLKSOURCE_HSE_DIV_2_OSC HSE divided by 2 from oscillator selected as USBOTGHS1 clock

__HAL_RCC_USBOTGHS2_CONFIG

Description:

- Macro to configure the USB OTGHS2 clock.

Parameters:

- __USBOTGHS2_CLKSOURCE__: specifies the USB OTGHS2 clock source. This parameter can be one of the following values:
  - RCC_USBOTGHS2CLKSOURCE_HSE_DIV2 HSE divided by 2 selected as USBOTGHS2 clock
  - RCC_USBOTGHS2CLKSOURCE_CLKP Peripheral clock CKLP selected as USBOTGHS2 clock
  - RCC_USBOTGHS2CLKSOURCE_IC15 IC15 selected as USBOTGHS2 clock
  - RCC_USBOTGHS2CLKSOURCE_HSE_DIV_2_OSC HSE divided by 2 from oscillator selected as USBOTGHS2 clock

__HAL_RCC_GET_USBOTGHS2_SOURCE

Description:

- Macro to get the USB OTGHS2 clock source.

Return value:

- The: clock source can be one of the following values:
  - RCC_USBOTGHS2CLKSOURCE_HSE_DIV2 HSE divided by 2 selected as USBOTGHS2 clock
  - RCC_USBOTGHS2CLKSOURCE_CLKP Peripheral clock CKLP selected as USBOTGHS2 clock
  - RCC_USBOTGHS2C LKSOURCE_IC15 IC15 selected as USBOTGHS2 clock
  - RCC_USBOTGHS2CLKSOURCE_HSE_DIV_2_OSC HSE divided by 2 from oscillator selected as USBOTGHS2 clock

__HAL_RCC_LSECSS_EXTI_ENABLE_IT

Description:

- Enable the RCC LSE CSS Extended Interrupt Line.

Return value:

- None

__HAL_RCC_LSECSS_EXTI_DISABLE_IT

Description:

- Disable the RCC LSE CSS Extended Interrupt Line.

Return value:

- None

__HAL_RCC_LSECSS_EXTI_ENABLE_EVENT

Description:

- Enable the RCC LSE CSS Event Line.

Return value:

- None.

__HAL_RCC_LSECSS_EXTI_DISABLE_EVENT

Description:

- Disable the RCC LSE CSS Event Line.

Return value:

- None.

RCC Extended MCOx Clock Config

__HAL_RCC_MCO1_ENABLE

Description:

- Macros to enable or disable the MCO1 clock output.

Return value:

- None

__HAL_RCC_MCO1_DISABLE

__HAL_RCC_MCO2_ENABLE

Description:

- Macros to enable or disable the MCO2 clock output.

Return value:

- None

__HAL_RCC_MCO2_DISABLE

__HAL_RCC_MCO1_CONFIG

Description:

- Macro to configure the MCO1 clock.

Parameters:

- __MCOCLKSOURCE__: specifies the MCO clock source. This parameter can be one of the following values:
  - RCC_MCO1SOURCE_HSI HSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_LSE LSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_MSI MSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_LSI LSI clock selected as MCO1 source
  - RCC_MCO1SOURCE_HSE HSE clock selected as MCO1 source
  - RCC_MCO1SOURCE_IC5 IC5 clock selected as MCO1 source
  - RCC_MCO1SOURCE_IC10 IC10 clock selected as MCO1 source
  - RCC_MCO1SOURCE_SYSA SYSA CPU clock selected as MCO1 source
- __MCODIV__: specifies the MCO clock prescaler. This parameter can be one of the following values:
  - RCC_MCODIV_1 up to RCC_MCODIV_16 : divider applied to MCO1 clock

Notes:

- MCO1 clock output shall be enabled with __HAL_RCC_MCO1_ENABLE() The MCO switch to the new clock source only occurs when the previous clock source is active (dynamic switch).

__HAL_RCC_MCO2_CONFIG

Description:

- Macro to configure the MCO2 clock.

Parameters:

- __MCOCLKSOURCE__: specifies the MCO clock source. This parameter can be one of the following values:
  - RCC_MCO2SOURCE_HSI HSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_LSE LSE clock selected as MCO2 source
  - RCC_MCO2SOURCE_MSI MSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_LSI LSI clock selected as MCO2 source
  - RCC_MCO2SOURCE_HSE HSE clock selected as MCO2 source
  - RCC_MCO2SOURCE_IC15 IC15 clock selected as MCO2 source
  - RCC_MCO2SOURCE_IC20 IC20 clock selected as MCO2 source
  - RCC_MCO2SOURCE_SYSB SYSB bus clock selected as MCO2 source
- __MCODIV__: specifies the MCO clock prescaler. This parameter can be one of the following values:
  - RCC_MCODIV_1 up to RCC_MCODIV_16 : divider applied to MCO2 clock

Notes:

- MCO2 clock output shall be enabled with __HAL_RCC_MCO2_ENABLE() The MCO switch to the new clock source only occurs when the previous clock source is active (dynamic switch).

58 HAL RIF Generic Driver

58.1 RIF Firmware driver registers structures

58.1.1 RIMC_MasterConfig_t

RIMC_MasterConfig_t is defined in the stm32n6xx_hal_rif.h

Data Fields

- ***uint32_t MasterCID***
- ***uint32_t SecPriv***

Field Documentation

- ***uint32_t RIMC_MasterConfig_t::MasterCID***
  One of ***RIF_COMPARTMENT_ID***
- ***uint32_t RIMC_MasterConfig_t::SecPriv***
  A combination of ***RIF_SEC_PRIV***

58.1.2 RISAF_BaseRegionConfig_t

RISAF_BaseRegionConfig_t is defined in the stm32n6xx_hal_rif.h

Data Fields

- ***uint32_t Filtering***
- ***uint32_t Secure***
- ***uint32_t PrivWhitelist***
- ***uint32_t ReadWhitelist***
- ***uint32_t WriteWhitelist***
- ***uint32_t StartAddress***
- ***uint32_t EndAddress***

Field Documentation

- ***uint32_t RISAF_BaseRegionConfig_t::Filtering***
  One of ***RIF_RISAF_FILTERING_MODE***
- ***uint32_t RISAF_BaseRegionConfig_t::Secure***
  One of ***RIF_SEC_PRIV***
- ***uint32_t RISAF_BaseRegionConfig_t::PrivWhitelist***
  A combination of ***RIF_COMPARTMENT_ID***
- ***uint32_t RISAF_BaseRegionConfig_t::ReadWhitelist***
  A combination of ***RIF_COMPARTMENT_ID***
- ***uint32_t RISAF_BaseRegionConfig_t::WriteWhitelist***
  A combination of ***RIF_COMPARTMENT_ID***
- ***uint32_t RISAF_BaseRegionConfig_t::StartAddress***
  Base region start, address offset to the base address of the protected address space
- ***uint32_t RISAF_BaseRegionConfig_t::EndAddress***
  Base region end, address offset to the base address of the protected address space

58.1.3 RISAF_SubRegionConfig_t

RISAF_SubRegionConfig_t is defined in the stm32n6xx_hal_rif.h

Data Fields

- ***uint32_t Filtering***
- ***uint32_t CID***
- ***uint32_t SecPriv***
- ***uint32_t ReadWrite***
- ***uint32_t Lock***
- ***uint32_t StartAddress***

- ***uint32_t EndAddress***

Field Documentation

- ***uint32_t RISAF_SubRegionConfig_t::Filtering***
  One of ***RIF_RISAF_FILTERING_MODE***
- ***uint32_t RISAF_SubRegionConfig_t::CID***
  One of ***RIF_COMPARTMENT_ID***
- ***uint32_t RISAF_SubRegionConfig_t::SecPriv***
  A combination of ***RIF_SEC_PRIV***
- ***uint32_t RISAF_SubRegionConfig_t::ReadWrite***
  A combination of ***RIF_RISAF_READ_WRITE***
- ***uint32_t RISAF_SubRegionConfig_t::Lock***
  One of ***RIF_LOCK_STATE***
- ***uint32_t RISAF_SubRegionConfig_t::StartAddress***
  Subregion start, address offset to the base address of the protected address space
- ***uint32_t RISAF_SubRegionConfig_t::EndAddress***
  Subregion end, address offset to the base address of the protected address space

58.1.4 RISAF_DelegationConfig_t

RISAF_DelegationConfig_t is defined in the stm32n6xx_hal_rif.h

Data Fields

- ***uint32_t Delegation***
- ***uint32_t DelegatedCID***

Field Documentation

- ***uint32_t RISAF_DelegationConfig_t::Delegation***
  Enable or Disable
- ***uint32_t RISAF_DelegationConfig_t::DelegatedCID***
  One of ***RIF_COMPARTMENT_ID***

58.1.5 RISAF_IllegalAccessData_t

RISAF_IllegalAccessData_t is defined in the stm32n6xx_hal_rif.h

Data Fields

- ***uint32_t CID***
- ***uint32_t SecPriv***
- ***uint32_t AccessType***
- ***uint32_t Address***

Field Documentation

- ***uint32_t RISAF_IllegalAccessData_t::CID***
  One of ***RIF_COMPARTMENT_ID***
- ***uint32_t RISAF_IllegalAccessData_t::SecPriv***
  A combination of ***RIF_SEC_PRIV***
- ***uint32_t RISAF_IllegalAccessData_t::AccessType***
  One of ***RIF_ACCESS_TYPE***
- ***uint32_t RISAF_IllegalAccessData_t::Address***

58.1.6 RISAF_IllegalAccess_t

RISAF_IllegalAccess_t is defined in the stm32n6xx_hal_rif.h

Data Fields

- ***uint32_t ErrorType***
- ***RISAF_IllegalAccessData_t Data***

Field Documentation

- ***uint32_t RISAF_IllegalAccess_t::ErrorType***
  One of ***RIF_RISAF_ILLEGAL_ACCESS***

- ***RISAF_IllegalAccessData_t RISAF_IllegalAccess_t::Data***

58.2 RIF Firmware driver API description

The following section lists the various functions of the RIF library.

58.2.1 How to use this driver

- Resource Isolation framework (RIF) is a comprehensive set of hardware blocks designed to enforce and manage isolation of STM32 hardware resources like memory and peripherals.
- Resource Isolation Framework (RIF) composed of the following sub-blocks:
  - RIMC: Resource Isolation Master Controller This sub-block assigns all non RIF-aware bus master to one security domain by setting secure, privileged and compartment information on the system bus. Note that if non-secure software is permitted to configure one of these peripherals, then this setting is ignored and all accesses initiated by the peripheral are forced to be non-secure.
  - RISC: Resource Isolation Slave Controller This sub-block assigns all non-RIF aware peripherals to zero, one or any security domains (secure, privilege, compartment).
  - RISAF: Resource Isolation Slave unit for Address space (Full version) This sub-block assigns memory regions and subregions to one or more security domains (secure, privilege, compartment).
  - IAC: Illegal Access Controller This sub-block centralizes detection of RIF-related accesses, managed by a secure application. Supported illegal accesses are: secure, privileged.
- All the setter functions are protected under the CPU_AS_TRUSTED_DOMAIN directive. It ensures that only the trusted domain can manage the critical configurations of the RIF. This directive is defined in the CMSIS file.

Locking RIF components configuration

1. Lock and get the lock configuration of RIMC registers until next reset with HAL_RIF_RIMC_Lock / HAL_RIF_RIMC_GetLock.
2. Lock and get the lock configuration of RISC registers until next reset with HAL_RIF_RISC_Lock / HAL_RIF_RISC_GetLock.
3. Lock and get the lock configuration of slave resources registers until next reset with HAL_RIF_RISC_SlaveConfigLock / HAL_RIF_RISC_GetSlaveConfigLock.
4. Lock and get the lock configuration of RISAF registers until next reset with HAL_RIF_RISAF_Lock / HAL_RIF_RISAF_GetLock.

Context-related functions

1. Set or get Debugger Access Port Compartment ID with HAL_RIF_RIMC_SetDebugAccessPortCID / HAL_RIF_RIMC_GetDebugAccessPortCID functions.
2. Check the Debug Domain and Global Debug Domain status with HAL_RIF_RIMC_GetDebugStatus. #if defined(GENERATOR_RIF_FEATURE_ENCRYPTION_IMPLEMENTED)

Encryption-related functions

1. Read of write RISAF encryption keys and related flags. #endif

Configuration of master-related attributes

1. Set or get the secure, privilege and compartment configuration of a bus master thanks to the HAL_RIF_RIMC_ConfigMasterAttributes / HAL_RIF_RIMC_GetConfigMasterAttributes functions.
2. Lock and get lock status the bus master attributes configuration until next system reset using HAL_RIF_RIMC_Lock.

Configuration of slave-related attributes

1. Set or get the secure and privilege configuration of a bus slave thanks to the HAL_RIF_RISC_SetSlaveSecureAttributes / HAL_RIF_RISC_GetSlaveSecureAttributes functions.
2. Lock and get lock status each bus slave attributes configuration using HAL_RIF_RISC_SlaveConfigLock or lock the whole RISC configuration with HAL_RIF_RISC_Lock until next system reset.

Configuration of RISAF attributes

1. Set or get a base region configuration with HAL_RIF_RISAF_ConfigBaseRegion / HAL_RIF_RISAF_GetConfigBaseRegion.
2. Set or get a subregion configuration with HAL_RIF_RISAF_ConfigSubRegion / HAL_RIF_RISAF_GetConfigSubRegion.
3. Delegate a subregion configuration to another CID with HAL_RIF_RISAF_ConfigSubRegionDelegation.
4. Get the data from an illegal access to a protected memory region with HAL_RIF_RISAF_GetIllegalAccess.

IAC related functions

1. Enable or disable peripheral illegal access detection with HAL_RIF_IAC_EnableIT / HAL_RIF_IAC_DisableIT.
2. Retrieve an illegal access flag from a designated peripheral with HAL_RIF_IAC_GetFlag or clear it with HAL_RIF_IAC_ClearFlag.
3. Illegal access interrupt service routines are served by HAL_RIF_IRQHandler() and user can add his own code using HAL_RIF_ILA_Callback().

58.2.2 Detailed description of functions

HAL_RIF_RIMC_Lock

Function name

void HAL_RIF_RIMC_Lock (void)

Function description

HAL_RIF_RIMC_GetLock

Function name

uint32_t HAL_RIF_RIMC_GetLock (void)

59.2 RNG Firmware driver API description

The following section lists the various functions of the RNG library.

59.2.1 How to use this driver

The RNG HAL driver can be used as follows:

1. Enable the RNG controller clock using __HAL_RCC_RNG_CLK_ENABLE() macro in HAL_RNG_MspInit().
2. Activate the RNG peripheral using HAL_RNG_Init() function.
3. Wait until the 32 bit Random Number Generator contains a valid random data using (polling/interrupt) mode.
4. Get the 32 bit random number using HAL_RNG_GenerateRandomNumber() function.

59.2.2 Callback registration

The compilation define USE_HAL_RNG_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_RNG_RegisterCallback() to register a user callback. Function HAL_RNG_RegisterCallback() allows to register following callbacks:

- ErrorCallback : RNG Error Callback.
- MspInitCallback : RNG MspInit.
- MspDeInitCallback : RNG MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_RNG_UnRegisterCallback() to reset a callback to the default weak (overridden) function. HAL_RNG_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : RNG Error Callback.
- MspInitCallback : RNG MspInit.
- MspDeInitCallback : RNG MspDeInit.

For specific callback ReadyDataCallback, use dedicated register callbacks: respectively HAL_RNG_RegisterReadyDataCallback() , HAL_RNG_UnRegisterReadyDataCallback().

By default, after the HAL_RNG_Init() and when the state is HAL_RNG_STATE_RESET all callbacks are set to the corresponding weak (overridden) functions: example HAL_RNG_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak (overridden) functions in the HAL_RNG_Init() and HAL_RNG_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_RNG_Init() and HAL_RNG_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_RNG_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_RNG_STATE_READY or HAL_RNG_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_RNG_RegisterCallback() before calling HAL_RNG_DeInit() or HAL_RNG_Init() function.

When The compilation define USE_HAL_RNG_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak (overridden) callbacks are used.

59.2.3 Detailed description of functions

HAL_RNG_Init

Function name

HAL_StatusTypeDef HAL_RNG_Init (RNG_HandleTypeDef * hrng)

Function description

HAL_RNG_DeInit

Function name

HAL_StatusTypeDef HAL_RNG_DeInit (RNG_HandleTypeDef * hrng)

Function description

HAL_RNG_MspInit

Function name

void HAL_RNG_MspInit (RNG_HandleTypeDef * hrng)

Function description

59.3 RNG Firmware driver defines

The following section lists the various define and macros of the module.

59.3.1 RNG

RNG

RNG Error Definition

HAL_RNG_ERROR_NONE

No error

HAL_RNG_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_RNG_ERROR_TIMEOUT

Timeout error

HAL_RNG_ERROR_BUSY

Busy error

HAL_RNG_ERROR_SEED

Seed error

HAL_RNG_ERROR_CLOCK

Clock error

RNG Interrupt definition

RNG_IT_DRDY

Data Ready interrupt

RNG_IT_CEI

Clock error interrupt

RNG_IT_SEI

Seed error interrupt

RNG Flag definition

RNG_FLAG_DRDY

Data ready

RNG_FLAG_CECS

Clock error current status

RNG_FLAG_SECS

Seed error current status

RNG Clock Error Detection

RNG_CED_ENABLE

Clock error detection Enabled

RNG_CED_DISABLE

Clock error detection Disabled

RNG Exported Macros

__HAL_RNG_RESET_HANDLE_STATE

Description:

- Reset RNG handle state.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_ENABLE

Description:

- Enables the RNG peripheral.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_DISABLE

Description:

- Disables the RNG peripheral.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_GET_FLAG

Description:

- Check the selected RNG flag status.

Parameters:

- __HANDLE__: RNG Handle
- __FLAG__: RNG flag This parameter can be one of the following values:
  - RNG_FLAG_DRDY: Data ready
  - RNG_FLAG_CECS: Clock error current status
  - RNG_FLAG_SECS: Seed error current status

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_RNG_CLEAR_FLAG

Description:

- Clears the selected RNG flag status.

Parameters:

- __HANDLE__: RNG handle
- __FLAG__: RNG flag to clear

Return value:

- None

Notes:

- WARNING: This is a dummy macro for HAL code alignment, flags RNG_FLAG_DRDY, RNG_FLAG_CECS and RNG_FLAG_SECS are read-only.

__HAL_RNG_ENABLE_IT

Description:

- Enables the RNG interrupts.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_DISABLE_IT

Description:

- Disables the RNG interrupts.

Parameters:

- __HANDLE__: RNG Handle

Return value:

- None

__HAL_RNG_GET_IT

Description:

- Checks whether the specified RNG interrupt has occurred or not.

Parameters:

- __HANDLE__: RNG Handle
- __INTERRUPT__: specifies the RNG interrupt status flag to check. This parameter can be one of the following values:
  - RNG_IT_DRDY: Data ready interrupt
  - RNG_IT_CEI: Clock error interrupt
  - RNG_IT_SEI: Seed error interrupt

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

__HAL_RNG_CLEAR_IT

Description:

- Clear the RNG interrupt status flags.

Parameters:

- __HANDLE__: RNG Handle
- __INTERRUPT__: specifies the RNG interrupt status flag to clear. This parameter can be one of the following values:
  - RNG_IT_CEI: Clock error interrupt
  - RNG_IT_SEI: Seed error interrupt

Return value:

- None

Notes:

- RNG_IT_DRDY flag is read-only, reading RNG_DR register automatically clears RNG_IT_DRDY.

60 HAL RNG Extension Driver

60.1 RNGEx Firmware driver registers structures

60.1.1 RNG_ConfigTypeDef

RNG_ConfigTypeDef is defined in the stm32n6xx_hal_rng_ex.h

Data Fields

- ***uint32_t Config1***
- ***uint32_t Config2***
- ***uint32_t Config3***
- ***uint32_t ClockDivider***
- ***uint32_t NistCompliance***
- ***uint32_t AutoReset***
- ***uint32_t HealthTest***

Field Documentation

- ***uint32_t RNG_ConfigTypeDef::Config1***
  Config1 must be a value between 0 and 0x3F
- ***uint32_t RNG_ConfigTypeDef::Config2***
  Config2 must be a value between 0 and 0x7
- ***uint32_t RNG_ConfigTypeDef::Config3***
  Config3 must be a value between 0 and 0xF
- ***uint32_t RNG_ConfigTypeDef::ClockDivider***
  Clock Divider factor.This parameter can be a value of ***RNGEx_Clock_Divider_Factor***
- ***uint32_t RNG_ConfigTypeDef::NistCompliance***
  NIST compliance.This parameter can be a value of ***RNGEx_NIST_Compliance***
- ***uint32_t RNG_ConfigTypeDef::AutoReset***
  automatic reset When a noise source error occurs value of ***RNGEx_Auto_Reset***
- ***uint32_t RNG_ConfigTypeDef::HealthTest***
  RNG health test control must be a value between 0x0FFCABFF and 0x00005200

60.2 RNGEx Firmware driver API description

The following section lists the various functions of the RNGEx library.

60.2.1 Detailed description of functions

61 HAL RTC Generic Driver

61.1 RTC Firmware driver registers structures

61.1.1 RTC_InitTypeDef

RTC_InitTypeDef is defined in the stm32n6xx_hal_rtc.h

Data Fields

- ***uint32_t HourFormat***
- ***uint32_t AsynchPrediv***
- ***uint32_t SynchPrediv***
- ***uint32_t OutPut***
- ***uint32_t OutPutRemap***
- ***uint32_t OutPutPolarity***
- ***uint32_t OutPutType***
- ***uint32_t OutPutPullUp***
- ***uint32_t BinMode***
- ***uint32_t BinMixBcdU***

Field Documentation

- ***uint32_t RTC_InitTypeDef::HourFormat***
  Specifies the RTC Hour Format. This parameter can be a value of ***RTC_Hour_Formats***
- ***uint32_t RTC_InitTypeDef::AsynchPrediv***
  Specifies the RTC Asynchronous Predivider value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x7F
- ***uint32_t RTC_InitTypeDef::SynchPrediv***
  Specifies the RTC Synchronous Predivider value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x7FFF
- ***uint32_t RTC_InitTypeDef::OutPut***
  Specifies which signal will be routed to the RTC output. This parameter can be a value of ***RTCEx_Output_selection_Definitions***
- ***uint32_t RTC_InitTypeDef::OutPutRemap***
  Specifies the remap for RTC output. This parameter can be a value of ***RTC_Output_ALARM_OUT_Remap***
- ***uint32_t RTC_InitTypeDef::OutPutPolarity***
  Specifies the polarity of the output signal. This parameter can be a value of ***RTC_Output_Polarity_Definitions***
- ***uint32_t RTC_InitTypeDef::OutPutType***
  Specifies the RTC Output Pin mode. This parameter can be a value of ***RTC_Output_Type_ALARM_OUT***
- ***uint32_t RTC_InitTypeDef::OutPutPullUp***
  Specifies the RTC Output Pull-Up mode. This parameter can be a value of ***RTC_Output_PullUp_ALARM_OUT***
- ***uint32_t RTC_InitTypeDef::BinMode***
  Specifies the RTC binary mode. This parameter can be a value of ***RTCEx_Binary_Mode***
- ***uint32_t RTC_InitTypeDef::BinMixBcdU***
  Specifies the BCD calendar update if and only if BinMode = RTC_BINARY_MIX. This parameter can be a value of ***RTCEx_Binary_mix_BCDU***

61.1.2 RTC_TimeTypeDef

RTC_TimeTypeDef is defined in the stm32n6xx_hal_rtc.h

Data Fields

- ***uint8_t Hours***
- ***uint8_t Minutes***
- ***uint8_t Seconds***

- ***uint8_t TimeFormat***
- ***uint32_t SubSeconds***
- ***uint32_t SecondFraction***
- ***uint32_t DayLightSaving***
- ***uint32_t StoreOperation***

Field Documentation

- ***uint8_t RTC_TimeTypeDef::Hours***
  Specifies the RTC Time Hour. This parameter must be a number between: Min_Data = 0 and Max_Data = 12 if the RTC_HOURFORMAT_12 is selected. This parameter must be a number between: Min_Data = 0 and Max_Data = 23 if the RTC_HOURFORMAT_24 is selected
- ***uint8_t RTC_TimeTypeDef::Minutes***
  Specifies the RTC Time Minutes. This parameter must be a number between Min_Data = 0 and Max_Data = 59
- ***uint8_t RTC_TimeTypeDef::Seconds***
  Specifies the RTC Time Seconds. This parameter must be a number between Min_Data = 0 and Max_Data = 59
- ***uint8_t RTC_TimeTypeDef::TimeFormat***
  Specifies the RTC AM/PM Time. This parameter can be a value of ***RTC_AM_PM_Definitions***
- ***uint32_t RTC_TimeTypeDef::SubSeconds***
  Specifies the RTC_SSR RTC Sub Second register content. This field is not used by HAL_RTC_SetTime. If the free running 32 bit counter is not activated (mode binary none)
  - This parameter corresponds to a time unit range between [0-1] Second with [1 Sec / SecondFraction +1] granularity else
  - This parameter corresponds to the free running 32 bit counter.
- ***uint32_t RTC_TimeTypeDef::SecondFraction***
  Specifies the range or granularity of Sub Second register content corresponding to Synchronous pre-scaler factor value (PREDIV_S) This parameter corresponds to a time unit range between [0-1] Second with [1 Sec / SecondFraction +1] granularity. This field will be used only by HAL_RTC_GetTime function
- ***uint32_t RTC_TimeTypeDef::DayLightSaving***
  This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions
- ***uint32_t RTC_TimeTypeDef::StoreOperation***
  This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions

61.1.3 RTC_DateTypeDef

RTC_DateTypeDef is defined in the stm32n6xx_hal_rtc.h

Data Fields

- ***uint8_t WeekDay***
- ***uint8_t Month***
- ***uint8_t Date***
- ***uint8_t Year***

Field Documentation

- ***uint8_t RTC_DateTypeDef::WeekDay***
  Specifies the RTC Date WeekDay. This parameter can be a value of ***RTC_WeekDay_Definitions***
- ***uint8_t RTC_DateTypeDef::Month***
  Specifies the RTC Date Month (in BCD format). This parameter can be a value of ***RTC_Month_Date_Definitions***
- ***uint8_t RTC_DateTypeDef::Date***
  Specifies the RTC Date. This parameter must be a number between Min_Data = 1 and Max_Data = 31
- ***uint8_t RTC_DateTypeDef::Year***
  Specifies the RTC Date Year. This parameter must be a number between Min_Data = 0 and Max_Data = 99

61.1.4 RTC_AlarmTypeDef

RTC_AlarmTypeDef is defined in the stm32n6xx_hal_rtc.h

Data Fields

- ***RTC_TimeTypeDef AlarmTime***
- ***uint32_t AlarmMask***
- ***uint32_t AlarmSubSecondMask***
- ***uint32_t BinaryAutoClr***
- ***uint32_t AlarmDateWeekDaySel***
- ***uint8_t AlarmDateWeekDay***
- ***uint32_t FlagAutoClr***
- ***uint32_t Alarm***

Field Documentation

- ***RTC_TimeTypeDef RTC_AlarmTypeDef::AlarmTime***
  Specifies the RTC Alarm Time members
- ***uint32_t RTC_AlarmTypeDef::AlarmMask***
  Specifies the RTC Alarm Masks. This parameter can be a value of ***RTC_AlarmMask_Definitions***
- ***uint32_t RTC_AlarmTypeDef::AlarmSubSecondMask***
  Specifies the RTC Alarm SubSeconds Masks. if Binary mode is RTC_BINARY_ONLY or is RTC_BINARY_MIX This parameter can be a value of ***RTCEx_Alarm_Sub_Seconds_binary_Masks_Definitions*** else if Binary mode is RTC_BINARY_NONE This parameter can be a value of ***RTC_Alarm_Sub_Seconds_BCD_Masks_Definitions***
- ***uint32_t RTC_AlarmTypeDef::BinaryAutoClr***
  Clear synchronously counter (RTC_SSR) on binary alarm. RTC_ALARMSUBSECONDBIN_AUTOCLR_YES must only be used if Binary mode is RTC_BINARY_ONLY This parameter can be a value of ***RTCEx_Alarm_Sub_Seconds_binary_Clear_Definitions***
- ***uint32_t RTC_AlarmTypeDef::AlarmDateWeekDaySel***
  Specifies the RTC Alarm is on Date or WeekDay. This parameter can be a value of ***RTC_AlarmDateWeekDay_Definitions***
- ***uint8_t RTC_AlarmTypeDef::AlarmDateWeekDay***
  Specifies the RTC Alarm Date/WeekDay. If the Alarm Date is selected, this parameter must be set to a value in the 1-31 range. If the Alarm WeekDay is selected, this parameter can be a value of ***RTC_WeekDay_Definitions***
- ***uint32_t RTC_AlarmTypeDef::FlagAutoClr***
  Specifies the alarm trigger generation. This feature is meaningful to avoid any RTC software execution after configuration. This parameter can be a value of ***RTC_ALARM_Flag_AutoClear_Definitions***
- ***uint32_t RTC_AlarmTypeDef::Alarm***
  Specifies the alarm. This parameter can be a value of ***RTC_Alarms_Definitions***

61.1.5 __RTC_HandleTypeDef

__RTC_HandleTypeDef is defined in the stm32n6xx_hal_rtc.h

Data Fields

- ***RTC_TypeDef * Instance***
- ***RTC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_RTCStateTypeDef State***
- ***void(* AlarmAEventCallback***

- ***void(* __RTC_HandleTypeDef::MspInitCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC Msp Init callback
- ***void(* __RTC_HandleTypeDef::MspDeInitCallback)(struct __RTC_HandleTypeDef *hrtc)***
  RTC Msp DeInit callback

61.2 RTC Firmware driver API description

The following section lists the various functions of the RTC library.

61.2.1 RTC Operating Condition

The real-time clock (RTC) and the RTC backup registers can be powered from the VBAT voltage when the main VDD supply is powered off. To retain the content of the RTC backup registers and supply the RTC when VDD is turned off, VBAT pin can be connected to an optional standby voltage supplied by a battery or by another source.

61.2.2 Backup Domain Reset

The backup domain reset sets all RTC registers and the RCC_BDCR register to their reset values. A backup domain reset is generated when one of the following events occurs:

1. Software reset, triggered by setting the BDRST bit in the RCC Backup domain control register (RCC_BDCR).
2. VDD or VBAT power on, if both supplies have previously been powered off.
3. Tamper detection event resets all data backup registers.

61.2.3 Backup Domain Access

After reset, the backup domain (RTC registers and RTC backup data registers) is protected against possible unwanted write accesses.

To enable access to the RTC Domain and RTC registers, proceed as follows:

- Enable access to RTC domain using the HAL_PWR_EnableBkUpAccess() function.
- Call the function HAL_RCCEx_PeriphCLKConfig with RCC_PERIPHCLK_RTC for PeriphClockSelection and select RTCClockSelection (LSE, LSI or HSEdiv32)
- Enable RTC Clock using the __HAL_RCC_RTC_ENABLE() function.

61.2.4 How to use RTC Driver

- Enable the RTC domain access (see description in the section above).
- Configure the RTC Prescaler (Asynchronous and Synchronous) and RTC hour format using the HAL_RTC_Init() function.

Time and Date configuration

- To configure the RTC Calendar (Time and Date) use the HAL_RTC_SetTime() and HAL_RTC_SetDate() functions.
- To read the RTC Calendar, use the HAL_RTC_GetTime() and HAL_RTC_GetDate() functions.

Alarm configuration

- To configure the RTC Alarm use the HAL_RTC_SetAlarm() function. You can also configure the RTC Alarm with interrupt mode using the HAL_RTC_SetAlarm_IT() function.
- To read the RTC Alarm, use the HAL_RTC_GetAlarm() function.

61.2.5 RTC and low power modes

The MCU can be woken up from a low power mode by an RTC alternate function.

The RTC alternate functions are the RTC alarms (Alarm A and Alarm B), RTC wakeup, RTC tamper event detection and RTC time stamp event detection. These RTC alternate functions can wake up the system from the Stop and Standby low power modes.

The system can also wake up from low power modes without depending on an external interrupt (Auto-wakeup mode), by using the RTC alarm or the RTC wakeup events.

The RTC provides a programmable time base for waking up from the Stop or Standby mode at regular intervals. Wakeup from STOP and STANDBY modes is possible only when the RTC clock source is LSE or LSI.

Callback registration

61.2.6 Detailed description of functions

HAL_RTC_Init

Function name

61.3 RTC Firmware driver defines

The following section lists the various define and macros of the module.

61.3.1 RTC

RTC

RTC AlarmDateWeekDay Definitions

RTC_ALARMDATEWEEKDAYSEL_DATE

RTC_ALARMDATEWEEKDAYSEL_WEEKDAY

RTC AlarmMask Definitions

RTC_ALARMMASK_NONE

RTC_ALARMMASK_DATEWEEKDAY

RTC_ALARMMASK_HOURS

RTC_ALARMMASK_MINUTES

RTC_ALARMMASK_SECONDS

RTC_ALARMMASK_ALL

RTC Alarms Definitions

RTC_ALARM_A

RTC_ALARM_B

RTC Alarms Flag Auto Clear Definitions

ALARM_FLAG_AUTOCLR_ENABLE

ALARM_FLAG_AUTOCLR_DISABLE

RTC Alarm Sub Seconds BCD Masks Definitions

RTC_ALARMSUBSECONDMASK_ALL

All Alarm SS fields are masked. There is no comparison on sub seconds for Alarm

RTC_ALARMSUBSECONDMASK_SS14_1

SS[14:1] not used in Alarmcomparison. Only SS[0] is compared

RTC_ALARMSUBSECONDMASK_SS14_2

SS[14:2] not used in Alarm comparison. Only SS[1:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_3

SS[14:3] not used in Alarm comparison. Only SS[2:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_4

SS[14:4] not used in Alarm comparison. Only SS[3:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_5

SS[14:5] not used in Alarm comparison. Only SS[4:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_6

SS[14:6] not used in Alarm comparison. Only SS[5:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_7

SS[14:7] not used in Alarm comparison. Only SS[6:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_8

SS[14:8] not used in Alarm comparison. Only SS[7:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_9

SS[14:9] not used in Alarm comparison. Only SS[8:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_10

SS[14:10] not used in Alarm comparison. Only SS[9:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_11

SS[14:11] not used in Alarm comparison. Only SS[10:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_12

SS[14:12] not used in Alarm comparison.Only SS[11:0] are compared

RTC_ALARMSUBSECONDMASK_SS14_13

SS[14:13] not used in Alarm comparison. Only SS[12:0] are compared

RTC_ALARMSUBSECONDMASK_SS14

SS[14] not used in Alarm comparison. Only SS[13:0] are compared

RTC_ALARMSUBSECONDMASK_NONE

SS[14:0] are compared and must match to activate alarm

RTC AM PM Definitions

RTC_HOURFORMAT12_AM

RTC_HOURFORMAT12_PM

RTC Clear Flags Definitions

RTC_CLEAR_SSRUF

Clear SSR underflow flag

RTC_CLEAR_ITSF

Clear Internal Time-stamp flag

RTC_CLEAR_TSOVF

Clear Time-stamp overflow flag

RTC_CLEAR_TSF

Clear Time-stamp flag

RTC_CLEAR_WUTF

Clear Wakeup timer flag

RTC_CLEAR_ALRBF

Clear Alarm B flag

RTC_CLEAR_ALRAF

Clear Alarm A flag

RTC DayLightSaving Definitions

RTC_DAYLIGHTSAVING_SUB1H

RTC_DAYLIGHTSAVING_ADD1H

RTC_DAYLIGHTSAVING_NONE

RTC Exported Macros

__HAL_RTC_RESET_HANDLE_STATE

Description:

- Reset RTC handle state.

Parameters:

- __HANDLE__: RTC handle.

Return value:

- None

__HAL_RTC_WRITEPROTECTION_DISABLE

Description:

- Disable the write protection for RTC registers.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_WRITEPROTECTION_ENABLE

Description:

- Enable the write protection for RTC registers.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_DAYLIGHT_SAVING_TIME_ADD1H

Description:

- Add 1 hour (summer time change).

Parameters:

- __HANDLE__: specifies the RTC handle.
- __BKP__: Backup This parameter can be:
  - RTC_STOREOPERATION_RESET
  - RTC_STOREOPERATION_SET

Return value:

- None

Notes:

- This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions

__HAL_RTC_DAYLIGHT_SAVING_TIME_SUB1H

Description:

- Subtract 1 hour (winter time change).

Parameters:

- __HANDLE__: specifies the RTC handle.
- __BKP__: Backup This parameter can be:
  - RTC_STOREOPERATION_RESET
  - RTC_STOREOPERATION_SET

Return value:

- None

Notes:

- This interface is deprecated. To manage Daylight Saving Time, please use HAL_RTC_DST_xxx functions

__HAL_RTC_ALARMA_ENABLE

Description:

- Enable the RTC ALARMA peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARMA_DISABLE

Description:

- Disable the RTC ALARMA peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARMB_ENABLE

Description:

- Enable the RTC ALARMB peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARMB_DISABLE

Description:

- Disable the RTC ALARMB peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_ALARM_ENABLE_IT

Description:

- Enable the RTC Alarm interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- None

__HAL_RTC_ALARM_DISABLE_IT

Description:

- Disable the RTC Alarm interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to be enabled or disabled. This parameter can be any combination of the following values:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- None

__HAL_RTC_ALARM_GET_IT

Description:

- Check whether the specified RTC Alarm interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to check. This parameter can be:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RTC_ALARM_GET_IT_SOURCE

Description:

- Check whether the specified RTC Alarm interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Alarm interrupt sources to check. This parameter can be:
  - RTC_IT_ALRA Alarm A interrupt
  - RTC_IT_ALRB Alarm B interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RTC_ALARM_GET_FLAG

Description:

- Get the selected RTC Alarms flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Alarm Flag sources to check. This parameter can be:
  - RTC_FLAG_ALRAF
  - RTC_FLAG_ALRBF

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_RTC_ALARM_CLEAR_FLAG

Description:

- Clear the RTC Alarms pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Alarm Flag sources to clear. This parameter can be:
  - RTC_FLAG_ALRAF
  - RTC_FLAG_ALRBF

Return value:

- None

__HAL_RTC_IS_CALENDAR_INITIALIZED

Description:

- Check whether if the RTC Calendar is initialized.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- The: state of RTC Calendar initialization (TRUE or FALSE).

RTC Flags Definitions

RTC_FLAG_RECALPF

Recalibration pending flag

62 HAL RTC Extension Driver

62.1 RTCEx Firmware driver registers structures

62.1.1 RTC_TamperTypeDef

RTC_TamperTypeDef is defined in the stm32n6xx_hal_rtc_ex.h

Data Fields

- ***uint32_t Tamper***
- ***uint32_t Trigger***
- ***uint32_t NoErase***
- ***uint32_t MaskFlag***
- ***uint32_t Filter***
- ***uint32_t SamplingFrequency***
- ***uint32_t PrechargeDuration***
- ***uint32_t TamperPullUp***
- ***uint32_t TimeStampOnTamperDetection***

Field Documentation

- ***uint32_t RTC_TamperTypeDef::Tamper***
  Specifies the Tamper Pin. This parameter can be a value of ***RTCEx_Tamper_Pins***
- ***uint32_t RTC_TamperTypeDef::Trigger***
  Specifies the Tamper Trigger. This parameter can be a value of ***RTCEx_Tamper_Trigger***
- ***uint32_t RTC_TamperTypeDef::NoErase***
  Specifies the Tamper no erase mode. This parameter can be a value of ***RTCEx_Tamper_EraseBackUp***
- ***uint32_t RTC_TamperTypeDef::MaskFlag***
  Specifies the Tamper Flag masking. This parameter can be a value of ***RTCEx_Tamper_MaskFlag***
- ***uint32_t RTC_TamperTypeDef::Filter***
  Specifies the TAMP Filter Tamper. This parameter can be a value of ***RTCEx_Tamper_Filter***
- ***uint32_t RTC_TamperTypeDef::SamplingFrequency***
  Specifies the sampling frequency. This parameter can be a value of ***RTCEx_Tamper_Sampling_Frequencies***
- ***uint32_t RTC_TamperTypeDef::PrechargeDuration***
  Specifies the Precharge Duration. This parameter can be a value of ***RTCEx_Tamper_Pin_Precharge_Duration***
- ***uint32_t RTC_TamperTypeDef::TamperPullUp***
  Specifies the Tamper PullUp. This parameter can be a value of ***RTCEx_Tamper_Pull_UP***
- ***uint32_t RTC_TamperTypeDef::TimeStampOnTamperDetection***
  Specifies the TimeStampOnTamperDetection. This parameter can be a value of ***RTCEx_Tamper_TimeStampOnTamperDetection***

62.1.2 RTC_ATampInputTypeDef

RTC_ATampInputTypeDef is defined in the stm32n6xx_hal_rtc_ex.h

Data Fields

- ***uint32_t Enable***
- ***uint32_t Interrupt***
- ***uint32_t Output***
- ***uint32_t NoErase***
- ***uint32_t MaskFlag***

Field Documentation

- ***uint32_t RTC_ATampInputTypeDef::Enable***
  Specifies the Tamper input is active. This parameter can be a value of ***RTCEx_ActiveTamper_Enable***

- ***uint32_t RTC_ATampInputTypeDef::Interrupt***
  Specifies the interrupt mode. This parameter can be a value of ***RTCEx_ActiveTamper_Interrupt***
- ***uint32_t RTC_ATampInputTypeDef::Output***
  Specifies the TAMP output to be compared with. The same output can be used for several tamper inputs. This parameter can be a value of ***RTCEx_ActiveTamper_Sel***
- ***uint32_t RTC_ATampInputTypeDef::NoErase***
  Specifies the Tamper no erase mode. This parameter can be a value of ***RTCEx_Tamper_EraseBackUp***
- ***uint32_t RTC_ATampInputTypeDef::MaskFlag***
  Specifies the Tamper Flag masking. This parameter can be a value of ***RTCEx_Tamper_MaskFlag***

62.1.3 RTC_ActiveTampersTypeDef

RTC_ActiveTampersTypeDef is defined in the stm32n6xx_hal_rtc_ex.h

Data Fields

- ***uint32_t ActiveFilter***
- ***uint32_t ActiveAsyncPrescaler***
- ***uint32_t TimeStampOnTamperDetection***
- ***uint32_t ActiveOutputChangePeriod***
- ***uint32_t Seed***
- ***RTC_ATampInputTypeDef TampInput***

Field Documentation

- ***uint32_t RTC_ActiveTampersTypeDef::ActiveFilter***
  Specifies the Active tamper filter enable. This parameter can be a value of ***RTCEx_ActiveTamper_Filter***
- ***uint32_t RTC_ActiveTampersTypeDef::ActiveAsyncPrescaler***
  Specifies the Active Tamper asynchronous Prescaler clock. This parameter can be a value of ***RTCEx_ActiveTamper_Async_prescaler***
- ***uint32_t RTC_ActiveTampersTypeDef::TimeStampOnTamperDetection***
  Specifies the timeStamp on tamper detection. This parameter can be a value of ***RTCEx_Tamper_TimeStampOnTamperDetection***
- ***uint32_t RTC_ActiveTampersTypeDef::ActiveOutputChangePeriod***
  Specifies the Active Tamper output change period. This parameter can be a value from 0 to 7
- ***uint32_t RTC_ActiveTampersTypeDef::Seed[RTC_ATAMP_SEED_NB_UINT32]***
  Specifies the RNG Seed value. This parameter is an array of value from 0 to 0xFFFFFFFF
- ***RTC_ATampInputTypeDef RTC_ActiveTampersTypeDef::TampInput[RTC_TAMP_NB]***
  Specifies configuration of all active tampers. The index of TampInput[RTC_TAMP_NB] can be a value of RTCEx_ActiveTamper_Sel

62.1.4 RTC_InternalTamperTypeDef

RTC_InternalTamperTypeDef is defined in the stm32n6xx_hal_rtc_ex.h

Data Fields

- ***uint32_t IntTamper***
- ***uint32_t TimeStampOnTamperDetection***
- ***uint32_t NoErase***

Field Documentation

- ***uint32_t RTC_InternalTamperTypeDef::IntTamper***
  Specifies the Internal Tamper Pin. This parameter can be a value of ***RTCEx_Internal_Tamper_Pins***
- ***uint32_t RTC_InternalTamperTypeDef::TimeStampOnTamperDetection***
  Specifies the TimeStampOnTamperDetection. This parameter can be a value of ***RTCEx_Tamper_TimeStampOnTamperDetection***
- ***uint32_t RTC_InternalTamperTypeDef::NoErase***
  Specifies the internal Tamper no erase mode. This parameter can be a value of ***RTCEx_Tamper_EraseBackUp***

62.1.5 RTC_SecureStateTypeDef

RTC_SecureStateTypeDef is defined in the stm32n6xx_hal_rtc_ex.h

Data Fields

- ***uint32_t rtcSecureFull***
- ***uint32_t rtcNonSecureFeatures***
- ***uint32_t tampSecureFull***
- ***uint32_t backupRegisterStartZone2***
- ***uint32_t backupRegisterStartZone3***
- ***uint32_t MonotonicCounterSecure***

Field Documentation

- ***uint32_t RTC_SecureStateTypeDef::rtcSecureFull***
  Specifies If the RTC is fully secure or not. This parameter can be a value of ***RTCEx_RTC_Secure_Full***
- ***uint32_t RTC_SecureStateTypeDef::rtcNonSecureFeatures***
  Specifies the non-secure features. This parameter is only relevant if RTC is not fully secure (rtcSecureFull == RTC_SECURE_FULL_NO). This parameter can be a combination of ***RTCEx_RTC_NonSecure_Features***
- ***uint32_t RTC_SecureStateTypeDef::tampSecureFull***
  Specifies If the TAMP is fully secure or not execpt monotonic counters and BackUp registers. This parameter can be a value of ***RTCEx_TAMP_Secure_Full***
- ***uint32_t RTC_SecureStateTypeDef::backupRegisterStartZone2***
  Specifies the backup register start zone 2. Zone 1 : read secure write secure. Zone 2 : read non-secure write secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register. Warning : this parameter is shared with ***Section 61.3.1: RTC_PrivilegeStateTypeDef***
- ***uint32_t RTC_SecureStateTypeDef::backupRegisterStartZone3***
  Specifies the backup register start zone 3. Zone 3 : read non-secure write non-secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register. Warning : this parameter is shared with ***Section 61.3.1: RTC_PrivilegeStateTypeDef***
- ***uint32_t RTC_SecureStateTypeDef::MonotonicCounterSecure***
  Specifies If the monotonic counter is secure or not. This parameter can be a value of ***RTCEx_TAMP_Monotonic_Counter_Secure***

62.1.6 RTC_PrivilegeStateTypeDef

RTC_PrivilegeStateTypeDef is defined in the stm32n6xx_hal_rtc_ex.h

Data Fields

- ***uint32_t rtcPrivilegeFull***
- ***uint32_t rtcPrivilegeFeatures***
- ***uint32_t tampPrivilegeFull***
- ***uint32_t backupRegisterPrivZone***
- ***uint32_t backupRegisterStartZone2***
- ***uint32_t backupRegisterStartZone3***
- ***uint32_t MonotonicCounterPrivilege***

Field Documentation

- ***uint32_t RTC_PrivilegeStateTypeDef::rtcPrivilegeFull***
  Specifies If the RTC is fully privileged or not. This parameter can be a value of ***RTCEx_RTC_Privilege_Full***
- ***uint32_t RTC_PrivilegeStateTypeDef::rtcPrivilegeFeatures***
  Specifies the privileged features. This parameter is only relevant if RTC is not fully privileged (rtcPrivilegeFull == RTC_PRIVILEGE_FULL_NO). This parameter can be a combination of ***RTCEx_RTC_Privilege_Features***
- ***uint32_t RTC_PrivilegeStateTypeDef::tampPrivilegeFull***
  Specifies If the TAMP is fully privileged or not execpt monotonic counters and BackUp registers. This parameter can be a value of ***RTCEx_TAMP_Privilege_Full***
- ***uint32_t RTC_PrivilegeStateTypeDef::backupRegisterPrivZone***
  Specifies backup register zone to be privileged. This parameter can be a combination of ***RTCEx_Backup_Reg_Privilege_zone***. Warning : this parameter is writable in secure mode or if trustzone is disabled

- ***uint32_t RTC_PrivilegeStateTypeDef::backupRegisterStartZone2***
  Specifies the backup register start zone 2. Zone 1 : read secure, write secure. Zone 2 : read non-secure, write secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register . Warning : this parameter is writable in secure mode or if trustzone is disabled. Warning : this parameter is shared with ***Section 61.3.1: RTC_SecureStateTypeDef***
- ***uint32_t RTC_PrivilegeStateTypeDef::backupRegisterStartZone3***
  Specifies the backup register start zone 3. Zone 3 : read non-secure, write non-secure. This parameter can be RTC_BKP_DRx where x can be from 0 to 31 to specify the register. Warning : this parameter is writable in secure mode or if trustzone is disabled. Warning : this parameter is shared with ***Section 61.3.1: RTC_SecureStateTypeDef***
- ***uint32_t RTC_PrivilegeStateTypeDef::MonotonicCounterPrivilege***
  Specifies If the monotonic counter is privileged or not. This parameter can be a value of ***RTCEx_TAMP_Monotonic_Counter_Privilege***

62.2 RTCEx Firmware driver API description

The following section lists the various functions of the RTCEx library.

62.2.1 How to use this driver

- Enable the RTC domain access.
- Configure the RTC Prescaler (Asynchronous and Synchronous) and RTC hour format using the HAL_RTC_Init() function.

RTC Wakeup configuration

- To configure the RTC Wakeup Clock source and Counter use the HAL_RTCEx_SetWakeUpTimer() function. You can also configure the RTC Wakeup timer with interrupt mode using the HAL_RTCEx_SetWakeUpTimer_IT() function.
- To read the RTC WakeUp Counter register, use the HAL_RTCEx_GetWakeUpTimer() function.

Outputs configuration

The RTC has 2 outputs pins (RTC_OUT1 & RTC_OUT2). To configure the outputs, use the HAL_RTC_Init() function.

- RTC_OUT1 and RTC_OUT2 which select one of the following two outputs:
- CALIB: 512Hz or 1Hz clock output (with an LSE frequency of 32.768kHz). To enable the CALIB, use the HAL_RTCEx_SetCalibrationOutPut() function.
- TAMPALRM: This output is the OR between rtc_tamp_evt and ALARM signals. ALARM is enabled by configuring the OSEL[1:0] bits in the RTC_CR register which select the alarm A, alarm B or wakeup outputs. rtc_tamp_evt is enabled by setting the TAMPOE bit in the RTC_CR register which selects the tamper event outputs.

Smooth digital Calibration configuration

- Configure the RTC Original Digital Calibration Value and the corresponding calibration cycle period (32s,16s and 8s) using the HAL_RTCEx_SetSmoothCalib() function.

RTC synchronization

- The RTC can be finely adjusted using HAL_RTCEx_SetSynchroShift() function. Writing to RTC_SHIFTR can shift (either delay or advance) the clock with a resolution of 1 ck_apre period. The shift operation consists in adding the SUBFS[14:0] value to the synchronous prescaler counter SS[15:0]: this delays the clock.

Bypass shadow registers

- Enable bypass shadow registers using the HAL_RTCEx_EnableBypassShadow(). When the Bypass Shadow is enabled the calendar value are taken directly from the Calendar counter. Thus eliminating the need to wait for the RSF bit to be set. This is especially useful after exiting from low-power modes (Stop or Standby), since the shadow registers are not updated during these modes.

RTC ultra-low-power mode

- Configure the RTC ultra-low-power mode using HAL_RTCEx_SetLowPowerCalib() function. In this case, the calibration mechanism is applied on ck_apre instead of RTCCLK. The resulting accuracy is the same, but the calibration is performed during a calibration cycle of about 220 x PREDIV_A x RTCCLK pulses instead of 220 RTCCLK pulses.

RTC subsecond register underflow interruption

- Enable the RTC SSRU interruption mode using HAL_RTCEx_SetSSRU_IT() function. In this case, when the SSR rolls under 0, an SSRU interruption is triggered. Disable the RTC SSRU interruption mode using HAL_RTCEx_DeactivateSSRU() function.

TimeStamp configuration

- Enable the RTC TimeStamp using the HAL_RTCEx_SetTimeStamp() function. You can also configure the RTC TimeStamp with interrupt mode using the HAL_RTCEx_SetTimeStamp_IT() function.
- To read the RTC TimeStamp Time and Date register, use the HAL_RTCEx_GetTimeStamp() function.

Internal TimeStamp configuration

- Enable the RTC internal TimeStamp using the HAL_RTCEx_SetInternalTimeStamp() function. User has to check internal timestamp occurrence using __HAL_RTC_INTERNAL_TIMESTAMP_GET_FLAG.
- To read the RTC TimeStamp Time and Date register, use the HAL_RTCEx_GetTimeStamp() function.

Tamper configuration

- Enable the RTC Tamper and configure the Tamper filter count, trigger Edge or Level according to the Tamper filter (if equal to 0 Edge else Level) value, sampling frequency, NoErase, MaskFlag, precharge or discharge and Pull-UP using the HAL_RTCEx_SetTamper() function. You can configure RTC Tamper with interrupt mode using HAL_RTCEx_SetTamper_IT() function.
- The default configuration of the Tamper erases the backup registers. To avoid erase, enable the TAMPxPOM field on the TAMP_CR2 register.
- With new RTC tamper configuration, you have to call HAL_RTC_Init() in order to perform TAMP base address offset calculation.
- Enable Internal tamper using HAL_RTCEx_SetInternalTamper. IT mode can be chosen using setting Interrupt field.

Backup Data Registers and Device Secrets configuration

- To write to the RTC Backup Data registers, use the HAL_RTCEx_BKUPWrite() function.
- To read the RTC Backup registers, use the HAL_RTCEx_BKUPRead() function.
- To reset the RTC Backup registers and erase the device secrets, use HAL_RTCEx_BKUPErase() function.
- Enable the lock of the Boot hardware Key using the HAL_RTCEx_LockBootHardwareKey() function. The backup registers from TAMP_BKP0R to TAMP_BKP7R cannot be accessed neither in read nor in write (they are read as 0 and write ignore).
- Configure the erase of the Device Secrets using HAL_RTCEx_ConfigEraseDeviceSecrets() function.
- Block the access to the RTC Backup registers and all the device secrets using HAL_RTCEx_BKUPBlock() function.

Monotonic counter

- To increment the Monotonic counter, use the HAL_RTCEx_MonotonicCounterIncrement() function.
- To get the current value of the Monotonic counter, use the HAL_RTCEx_MonotonicCounterGet() function.

RTC & TAMP secure protection modes

- Set the security level of the RTC/TAMP/Backup registers using HAL_RTCEx_SecureModeSet() function. +) Get the security level of the RTC/TAMP/Backup registers using HAL_RTCEx_SecureModeGet() function.

RTC & TAMP privilege protection modes

- Set the privilege level of the RTC/TAMP/Backup registers using HAL_RTCEx_PrivilegeModeSet() function.
  +) Get the privilege level of the RTC/TAMP/Backup registers using HAL_RTCEx_PrivilegeModeGet() function.

62.2.2 Detailed description of functions

HAL_RTCEx_SetTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTimeStamp (RTC_HandleTypeDef * hrtc, uint32_t TimeStampEdge, uint32_t RTC_TimeStampPin)

Function description

HAL_RTCEx_SetTimeStamp_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTimeStamp_IT (RTC_HandleTypeDef * hrtc, uint32_t TimeStampEdge, uint32_t RTC_TimeStampPin)

Function description

HAL_RTCEx_DeactivateTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateTimeStamp (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_SetInternalTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_SetInternalTimeStamp (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_DeactivateInternalTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateInternalTimeStamp (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_GetTimeStamp

Function name

HAL_StatusTypeDef HAL_RTCEx_GetTimeStamp (const RTC_HandleTypeDef * hrtc, RTC_TimeTypeDef * sTimeStamp, RTC_DateTypeDef * sTimeStampDate, uint32_t Format)

Function description

HAL_RTCEx_TimeStampIRQHandler

Function name

void HAL_RTCEx_TimeStampIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_PollForTimeStampEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForTimeStampEvent (const RTC_HandleTypeDef * hrtc, uint32_t Timeout)

Function description

HAL_RTCEx_TimeStampEventCallback

Function name

void HAL_RTCEx_TimeStampEventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_SetWakeUpTimer

Function name

HAL_StatusTypeDef HAL_RTCEx_SetWakeUpTimer (RTC_HandleTypeDef * hrtc, uint32_t WakeUpCounter, uint32_t WakeUpClock)

Function description

HAL_RTCEx_SetWakeUpTimer_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetWakeUpTimer_IT (RTC_HandleTypeDef * hrtc, uint32_t WakeUpCounter, uint32_t WakeUpClock, uint32_t WakeUpAutoClr)

Function description

HAL_RTCEx_DeactivateWakeUpTimer

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateWakeUpTimer (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_GetWakeUpTimer

Function name

uint32_t HAL_RTCEx_GetWakeUpTimer (const RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_WakeUpTimerIRQHandler

Function name

void HAL_RTCEx_WakeUpTimerIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_WakeUpTimerEventCallback

Function name

void HAL_RTCEx_WakeUpTimerEventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_PollForWakeUpTimerEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForWakeUpTimerEvent (const RTC_HandleTypeDef * hrtc, uint32_t Timeout)

Function description

HAL_RTCEx_SetSmoothCalib

Function name

HAL_StatusTypeDef HAL_RTCEx_SetSmoothCalib (RTC_HandleTypeDef * hrtc, uint32_t SmoothCalibPeriod, uint32_t SmoothCalibPlusPulses, uint32_t SmoothCalibMinusPulsesValue)

Function description

HAL_RTCEx_SetLowPowerCalib

Function name

HAL_StatusTypeDef HAL_RTCEx_SetLowPowerCalib (RTC_HandleTypeDef * hrtc, uint32_t LowPowerCalib)

Function description

HAL_RTCEx_SetSynchroShift

Function name

HAL_StatusTypeDef HAL_RTCEx_SetSynchroShift (RTC_HandleTypeDef * hrtc, uint32_t ShiftAdd1S, uint32_t ShiftSubFS)

Function description

HAL_RTCEx_SetCalibrationOutPut

Function name

HAL_StatusTypeDef HAL_RTCEx_SetCalibrationOutPut (RTC_HandleTypeDef * hrtc, uint32_t CalibOutput)

Function description

HAL_RTCEx_DeactivateCalibrationOutPut

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateCalibrationOutPut (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_SetRefClock

Function name

HAL_StatusTypeDef HAL_RTCEx_SetRefClock (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_DeactivateRefClock

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateRefClock (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_EnableBypassShadow

Function name

HAL_StatusTypeDef HAL_RTCEx_EnableBypassShadow (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_DisableBypassShadow

Function name

HAL_StatusTypeDef HAL_RTCEx_DisableBypassShadow (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_MonotonicCounterIncrement

Function name

HAL_StatusTypeDef HAL_RTCEx_MonotonicCounterIncrement (const RTC_HandleTypeDef * hrtc, uint32_t Instance)

Function description

HAL_RTCEx_MonotonicCounterGet

Function name

HAL_StatusTypeDef HAL_RTCEx_MonotonicCounterGet (const RTC_HandleTypeDef * hrtc, uint32_t Instance, uint32_t * pValue)

Function description

HAL_RTCEx_SetSSRU_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetSSRU_IT (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_DeactivateSSRU

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateSSRU (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_SSRUIRQHandler

Function name

void HAL_RTCEx_SSRUIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_SSRUEventCallback

Function name

void HAL_RTCEx_SSRUEventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_AlarmBEventCallback

Function name

void HAL_RTCEx_AlarmBEventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_PollForAlarmBEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForAlarmBEvent (const RTC_HandleTypeDef * hrtc, uint32_t Timeout)

Function description

HAL_RTCEx_SetTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTamper (const RTC_HandleTypeDef * hrtc, const RTC_TamperTypeDef * sTamper)

Function description

HAL_RTCEx_SetActiveTampers

Function name

HAL_StatusTypeDef HAL_RTCEx_SetActiveTampers (RTC_HandleTypeDef * hrtc, const RTC_ActiveTampersTypeDef * sAllTamper)

Function description

HAL_RTCEx_SetActiveSeed

Function name

HAL_StatusTypeDef HAL_RTCEx_SetActiveSeed (RTC_HandleTypeDef * hrtc, const uint32_t * pSeed)

Function description

HAL_RTCEx_SetTamper_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetTamper_IT (const RTC_HandleTypeDef * hrtc, const RTC_TamperTypeDef * sTamper)

Function description

HAL_RTCEx_DeactivateTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateTamper (const RTC_HandleTypeDef * hrtc, uint32_t Tamper)

Function description

HAL_RTCEx_DeactivateActiveTampers

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateActiveTampers (const RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_PollForTamperEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForTamperEvent (const RTC_HandleTypeDef * hrtc, uint32_t Tamper, uint32_t Timeout)

Function description

HAL_RTCEx_SetInternalTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_SetInternalTamper (const RTC_HandleTypeDef * hrtc, const RTC_InternalTamperTypeDef * sIntTamper)

Function description

HAL_RTCEx_SetInternalTamper_IT

Function name

HAL_StatusTypeDef HAL_RTCEx_SetInternalTamper_IT (const RTC_HandleTypeDef * hrtc, const RTC_InternalTamperTypeDef * sIntTamper)

Function description

HAL_RTCEx_DeactivateInternalTamper

Function name

HAL_StatusTypeDef HAL_RTCEx_DeactivateInternalTamper (const RTC_HandleTypeDef * hrtc, uint32_t IntTamper)

Function description

HAL_RTCEx_PollForInternalTamperEvent

Function name

HAL_StatusTypeDef HAL_RTCEx_PollForInternalTamperEvent (const RTC_HandleTypeDef * hrtc, uint32_t IntTamper, uint32_t Timeout)

Function description

HAL_RTCEx_LockBootHardwareKey

Function name

HAL_StatusTypeDef HAL_RTCEx_LockBootHardwareKey (const RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_TamperIRQHandler

Function name

void HAL_RTCEx_TamperIRQHandler (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper1EventCallback

Function name

void HAL_RTCEx_Tamper1EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper2EventCallback

Function name

void HAL_RTCEx_Tamper2EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper3EventCallback

Function name

void HAL_RTCEx_Tamper3EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper4EventCallback

Function name

void HAL_RTCEx_Tamper4EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper5EventCallback

Function name

void HAL_RTCEx_Tamper5EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper6EventCallback

Function name

void HAL_RTCEx_Tamper6EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper7EventCallback

Function name

void HAL_RTCEx_Tamper7EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_Tamper8EventCallback

Function name

void HAL_RTCEx_Tamper8EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper1EventCallback

Function name

void HAL_RTCEx_InternalTamper1EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper2EventCallback

Function name

void HAL_RTCEx_InternalTamper2EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper3EventCallback

Function name

void HAL_RTCEx_InternalTamper3EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper4EventCallback

Function name

void HAL_RTCEx_InternalTamper4EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper5EventCallback

Function name

void HAL_RTCEx_InternalTamper5EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper6EventCallback

Function name

void HAL_RTCEx_InternalTamper6EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper7EventCallback

Function name

void HAL_RTCEx_InternalTamper7EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper8EventCallback

Function name

void HAL_RTCEx_InternalTamper8EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper9EventCallback

Function name

void HAL_RTCEx_InternalTamper9EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_InternalTamper11EventCallback

Function name

void HAL_RTCEx_InternalTamper11EventCallback (RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_BKUPWrite

Function name

void HAL_RTCEx_BKUPWrite (const RTC_HandleTypeDef * hrtc, uint32_t BackupRegister, uint32_t Data)

Function description

HAL_RTCEx_BKUPRead

Function name

uint32_t HAL_RTCEx_BKUPRead (const RTC_HandleTypeDef * hrtc, uint32_t BackupRegister)

Function description

HAL_RTCEx_BKUPErase

Function name

void HAL_RTCEx_BKUPErase (const RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_BKUPBlock

Function name

void HAL_RTCEx_BKUPBlock (const RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_BKUPUnblock

Function name

void HAL_RTCEx_BKUPUnblock (const RTC_HandleTypeDef * hrtc)

Function description

HAL_RTCEx_ConfigEraseDeviceSecrets

Function name

void HAL_RTCEx_ConfigEraseDeviceSecrets (const RTC_HandleTypeDef * hrtc, uint32_t DeviceSecretConf)

Function description

HAL_RTCEx_SecureModeGet

Function name

HAL_StatusTypeDef HAL_RTCEx_SecureModeGet (const RTC_HandleTypeDef * hrtc, RTC_SecureStateTypeDef * secureState)

Function description

HAL_RTCEx_SecureModeSet

Function name

HAL_StatusTypeDef HAL_RTCEx_SecureModeSet (const RTC_HandleTypeDef * hrtc, const RTC_SecureStateTypeDef * secureState)

Function description

HAL_RTCEx_PrivilegeModeSet

Function name

HAL_StatusTypeDef HAL_RTCEx_PrivilegeModeSet (const RTC_HandleTypeDef * hrtc, const RTC_PrivilegeStateTypeDef * privilegeState)

Function description

HAL_RTCEx_PrivilegeModeGet

Function name

HAL_StatusTypeDef HAL_RTCEx_PrivilegeModeGet (const RTC_HandleTypeDef * hrtc, RTC_PrivilegeStateTypeDef * privilegeState)

Function description

62.3 RTCEx Firmware driver defines

RTC_SHIFTADD1S_RESET

RTC_SHIFTADD1S_SET

RTC Alarm Sub Seconds

RTC_ALARMSUBSECONDBIN_AUTOCLR_NO

The synchronous Binary counter(SS[31:0] in RTC_SSR) is free-running

RTC_ALARMSUBSECONDBIN_AUTOCLR_YES

The synchronous Binary counter (SS[31:0] in RTC_SSR) is running from 0xFFFF FFFF to RTC_ALRMABINR -> SS[31:0] value and is automatically reloaded with 0xFFFF FFFF whenreaching RTC_ALRMABINR -> SS[31:0].

RTC Alarm Sub Seconds with binary or mix mode

RTC_ALARMSUBSECONDBINMASK_ALL

All Alarm SS fields are masked.There is no comparison on sub seconds for Alarm

RTC_ALARMSUBSECONDBINMASK_SS31_1

SS[31:1] are don't care in Alarm comparison. Only SS[0] is compared

RTC_ALARMSUBSECONDBINMASK_SS31_2

SS[31:2] are don't care in Alarm comparison. Only SS[1:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_3

SS[31:3] are don't care in Alarm comparison. Only SS[2:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_4

SS[31:4] are don't care in Alarm comparison. Only SS[3:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_5

SS[31:5] are don't care in Alarm comparison. Only SS[4:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_6

SS[31:6] are don't care in Alarm comparison. Only SS[5:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_7

SS[31:7] are don't care in Alarm comparison. Only SS[6:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_8

SS[31:8] are don't care in Alarm comparison. Only SS[7:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_9

SS[31:9] are don't care in Alarm comparison. Only SS[8:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_10

SS[31:10] are don't care in Alarm comparison. Only SS[9:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_11

SS[31:11] are don't care in Alarm comparison. Only SS[10:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_12

SS[31:12] are don't care in Alarm comparison.Only SS[11:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_13

SS[31:13] are don't care in Alarm comparison. Only SS[12:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_14

SS[31:14] are don't care in Alarm comparison. Only SS[13:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_15

SS[31:15] are don't care in Alarm comparison. Only SS[14:0] are compared

RTC_ALARMSUBSECONDBINMASK_SS31_16

SS[31:16] are don't care in Alarm comparison. Only SS[15:0] are compared

RTC_PRIVILEGE_BKUP_ZONE_NONE

RTC_PRIVILEGE_BKUP_ZONE_1

RTC_PRIVILEGE_BKUP_ZONE_2

RTC_PRIVILEGE_BKUP_ZONE_ALL

If Binary mode is RTC_BINARY_MIX, the BCD calendar second is incremented

RTC_BINARY_MIX_BCDU_0

The 1s BCD calendar increment is generated each time SS[7:0] = 0

RTC_BINARY_MIX_BCDU_1

The 1s BCD calendar increment is generated each time SS[8:0] = 0

RTC_BINARY_MIX_BCDU_2

The 1s BCD calendar increment is generated each time SS[9:0] = 0

RTC_BINARY_MIX_BCDU_3

The 1s BCD calendar increment is generated each time SS[10:0] = 0

RTC_BINARY_MIX_BCDU_4

The 1s BCD calendar increment is generated each time SS[11:0] = 0

RTC_BINARY_MIX_BCDU_5

The 1s BCD calendar increment is generated each time SS[12:0] = 0

RTC_BINARY_MIX_BCDU_6

The 1s BCD calendar increment is generated each time SS[13:0] = 0

RTC_BINARY_MIX_BCDU_7

The 1s BCD calendar increment is generated each time SS[14:0] = 0

RTC Binary Mode (32-bit free-running counter configuration).

RTC_BINARY_NONE

Free running BCD calendar mode (Binary mode disabled)

RTC_BINARY_ONLY

Free running Binary mode (BCD mode disabled)

RTC_BINARY_MIX

Free running BCD calendar and Binary modes

RTC Calibration

__HAL_RTC_CALIBRATION_OUTPUT_ENABLE

Description:

- Enable the RTC calibration output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_CALIBRATION_OUTPUT_DISABLE

Description:

- Disable the calibration output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_CLOCKREF_DETECTION_ENABLE

Description:

- Enable the clock reference detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_CLOCKREF_DETECTION_DISABLE

Description:

- Disable the clock reference detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_SHIFT_GET_FLAG

Description:

- Get the selected RTC shift operations flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC shift operation Flag is pending or not. This parameter can be:
  - RTC_FLAG_SHPF

Return value:

- The: state of __FLAG__ (TRUE or FALSE)

RTCEx Calib Output selection Definitions

RTC_CALIBOUTPUT_512HZ

RTC_CALIBOUTPUT_1HZ

RTCEx Exported Macros

__HAL_RTC_CLEAR_FLAG

Description:

- Clear the specified RTC pending flag.

Parameters:

- __HANDLE__: specifies the RTC Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - RTC_CLEAR_SSRUF Clear SSR underflow flag
  - RTC_CLEAR_ITSF Clear Internal Time-stamp flag
  - RTC_CLEAR_TSOVF Clear Time-stamp overflow flag
  - RTC_CLEAR_TSF Clear Time-stamp flag
  - RTC_CLEAR_WUTF Clear Wakeup timer flag
  - RTC_CLEAR_ALRBF Clear Alarm B flag
  - RTC_CLEAR_ALRAF Clear Alarm A flag

Return value:

- None

__HAL_RTC_GET_FLAG

Description:

- Check whether the specified RTC flag is set or not.

Parameters:

- __HANDLE__: specifies the RTC Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - RTC_FLAG_RECALPF Recalibration pending Flag
  - RTC_FLAG_INITF Initialization flag
  - RTC_FLAG_RSF Registers synchronization flag
  - RTC_FLAG_INITS Initialization status flag
  - RTC_FLAG_SHPF Shift operation pending flag
  - RTC_FLAG_WUTWF Wakeup timer write flag
  - RTC_FLAG_ITSF Internal Time-stamp flag
  - RTC_FLAG_TSOVF Time-stamp overflow flag
  - RTC_FLAG_TSF Time-stamp flag
  - RTC_FLAG_WUTF Wakeup timer flag
  - RTC_FLAG_ALRBF Alarm B flag
  - RTC_FLAG_ALRAF Alarm A flag

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

RTCEx Smooth calib Low Power Definitions

RTC_LPCAL_SET

Calibration window is 2exp20 ck_apre, which is the required configuration for ultra-low consumption mode.

RTC_LPCAL_RESET

Calibration window is 2exp20 RTCCLK, which is a high-consumption mode. This mode should be set only when less than 32s calibration window is required.

RTCEx Smooth calib period Definitions

RTC_SMOOTHCALIB_PERIOD_32SEC

If RTCCLK = 32768 Hz, Smooth calibration period is 32s, else 2exp20 RTCCLK pulses

RTC_SMOOTHCALIB_PERIOD_16SEC

If RTCCLK = 32768 Hz, Smooth calibration period is 16s, else 2exp19 RTCCLK pulses

RTC_SMOOTHCALIB_PERIOD_8SEC

If RTCCLK = 32768 Hz, Smooth calibration period is 8s, else 2exp18 RTCCLK pulses

RTCEx Smooth calib Plus pulses Definitions

RTC_SMOOTHCALIB_PLUSPULSES_SET

The number of RTCCLK pulses added during a X -second window = Y - CALM[8:0] with Y = 512, 256, 128 when X = 32, 16, 8

RTC_SMOOTHCALIB_PLUSPULSES_RESET

The number of RTCCLK pulses subbstited during a 32-second window = CALM[8:0]

RTC SSR Underflow

__HAL_RTC_SSRU_ENABLE_IT

Description:

- Enable the RTC SSRU interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC SSRU interrupt sources to be enabled. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- None

__HAL_RTC_SSRU_DISABLE_IT

Description:

- Disable the RTC SSRU interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC SSRU interrupt sources to be disabled. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- None

__HAL_RTC_SSRU_GET_IT

Description:

- Check whether the specified RTC SSRU interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC SSRU interrupt to check. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE)

__HAL_RTC_SSRU_GET_IT_SOURCE

Description:

- Check whether the specified RTC SSRU interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC SSRU interrupt sources to check. This parameter can be:
  - RTC_IT_SSRU SSRU interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE)

__HAL_RTC_SSRU_GET_FLAG

Description:

- Get the selected RTC SSRU's flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC SSRU Flag is pending or not. This parameter can be:
  - RTC_FLAG_SSRUF

Return value:

- The: state of __FLAG__ (TRUE or FALSE)

__HAL_RTC_SSRU_CLEAR_FLAG

Description:

- Clear the RTC SSRU's pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC SSRU Flag to clear. This parameter can be:
  - RTC_FLAG_SSRUF

Return value:

- None

RTCEx tamper

__HAL_RTC_TAMPER_ENABLE

Description:

- Enable the TAMP Tamper input detection.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __TAMPER__: specifies the RTC Tamper source to be enabled. This parameter can be any combination of the following values:
  - RTC_TAMPER_ALL: All tampers
  - RTC_TAMPER_1: Tamper1
  - RTC_TAMPER_2: Tamper2
  - RTC_TAMPER_3: Tamper3
  - RTC_TAMPER_4: Tamper4
  - RTC_TAMPER_5: Tamper5
  - RTC_TAMPER_6: Tamper6
  - RTC_TAMPER_7: Tamper7
  - RTC_TAMPER_8: Tamper8

Return value:

- None

__HAL_RTC_TAMPER_DISABLE

Description:

- Disable the TAMP Tamper input detection.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __TAMPER__: specifies the RTC Tamper sources to be enabled. This parameter can be any combination of the following values:
  - RTC_TAMPER_ALL: All tampers
  - RTC_TAMPER_1: Tamper1
  - RTC_TAMPER_2: Tamper2
  - RTC_TAMPER_3: Tamper3
  - RTC_TAMPER_4: Tamper4
  - RTC_TAMPER_5: Tamper5
  - RTC_TAMPER_6: Tamper6
  - RTC_TAMPER_7: Tamper7
  - RTC_TAMPER_8: Tamper8

__HAL_RTC_TAMPER_ENABLE_IT

Description:

- Enable the TAMP Tamper interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt sources to be enabled. This parameter can be any combination of the following values:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt

Return value:

- None

__HAL_RTC_TAMPER_DISABLE_IT

Description:

- Disable the TAMP Tamper interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt sources to be disabled. This parameter can be any combination of the following values:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt

Return value:

- None

__HAL_RTC_TAMPER_GET_IT

Description:

- Check whether the specified RTC Tamper interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt to check. This parameter can be:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt
  - RTC_IT_INT_TAMP_ALL: All Internal Tamper interrupts
  - RTC_IT_INT_TAMP_1: Internal Tamper1 interrupt
  - RTC_IT_INT_TAMP_2: Internal Tamper2 interrupt
  - RTC_IT_INT_TAMP_3: Internal Tamper3 interrupt
  - RTC_IT_INT_TAMP_4: Internal Tamper4 interrupt
  - RTC_IT_INT_TAMP_5: Internal Tamper5 interrupt
  - RTC_IT_INT_TAMP_6: Internal Tamper6 interrupt
  - RTC_IT_INT_TAMP_7: Internal Tamper7 interrupt
  - RTC_IT_INT_TAMP_8: Internal Tamper8 interrupt
  - RTC_IT_INT_TAMP_9: Internal Tamper9 interrupt
  - RTC_IT_INT_TAMP_11: Internal Tamper11 interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE)

__HAL_RTC_TAMPER_GET_IT_SOURCE

Description:

- Check whether the specified RTC Tamper interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Tamper interrupt source to check. This parameter can be:
  - RTC_IT_TAMP_ALL: All tampers interrupts
  - RTC_IT_TAMP_1: Tamper1 interrupt
  - RTC_IT_TAMP_2: Tamper2 interrupt
  - RTC_IT_TAMP_3: Tamper3 interrupt
  - RTC_IT_TAMP_4: Tamper4 interrupt
  - RTC_IT_TAMP_5: Tamper5 interrupt
  - RTC_IT_TAMP_6: Tamper6 interrupt
  - RTC_IT_TAMP_7: Tamper7 interrupt
  - RTC_IT_TAMP_8: Tamper8 interrupt
  - RTC_IT_INT_TAMP_ALL: All internal tampers interrupts
  - RTC_IT_INT_TAMP_1: Internal Tamper1 interrupt
  - RTC_IT_INT_TAMP_2: Internal Tamper2 interrupt
  - RTC_IT_INT_TAMP_3: Internal Tamper3 interrupt
  - RTC_IT_INT_TAMP_4: Internal Tamper4 interrupt
  - RTC_IT_INT_TAMP_5: Internal Tamper5 interrupt
  - RTC_IT_INT_TAMP_6: Internal Tamper6 interrupt
  - RTC_IT_INT_TAMP_7: Internal Tamper7 interrupt
  - RTC_IT_INT_TAMP_8: Internal Tamper8 interrupt
  - RTC_IT_INT_TAMP_9: Internal Tamper9 interrupt
  - RTC_IT_INT_TAMP_11: Internal Tamper11 interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE)

__HAL_RTC_TAMPER_GET_FLAG

Description:

- Get the selected RTC Tampers flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Tamper Flag is pending or not. This parameter can be:
  - RTC_FLAG_TAMP_ALL: All tampers flag
  - RTC_FLAG_TAMP_1: Tamper1 flag
  - RTC_FLAG_TAMP_2: Tamper2 flag
  - RTC_FLAG_TAMP_3: Tamper3 flag
  - RTC_FLAG_TAMP_4: Tamper4 flag
  - RTC_FLAG_TAMP_5: Tamper5 flag
  - RTC_FLAG_TAMP_6: Tamper6 flag
  - RTC_FLAG_TAMP_7: Tamper7 flag
  - RTC_FLAG_TAMP_8: Tamper8 flag
  - RTC_FLAG_INT_TAMP_1: Internal Tamper1 flag
  - RTC_FLAG_INT_TAMP_2: Internal Tamper2 flag
  - RTC_FLAG_INT_TAMP_3: Internal Tamper3 flag
  - RTC_FLAG_INT_TAMP_4: Internal Tamper4 flag
  - RTC_FLAG_INT_TAMP_5: Internal Tamper5 flag
  - RTC_FLAG_INT_TAMP_6: Internal Tamper6 flag
  - RTC_FLAG_INT_TAMP_7: Internal Tamper7 flag
  - RTC_FLAG_INT_TAMP_8: Internal Tamper8 flag
  - RTC_FLAG_INT_TAMP_9: Internal Tamper9 flag
  - RTC_FLAG_INT_TAMP_11: Internal Tamper11 flag

Return value:

- The: state of __FLAG__ (TRUE or FALSE)

__HAL_RTC_TAMPER_CLEAR_FLAG

Description:

- Clear the RTC Tamper's pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Tamper Flag to clear. This parameter can be:
  - RTC_FLAG_TAMP_ALL: All tampers flag
  - RTC_FLAG_TAMP_1: Tamper1 flag
  - RTC_FLAG_TAMP_2: Tamper2 flag
  - RTC_FLAG_TAMP_3: Tamper3 flag
  - RTC_FLAG_TAMP_4: Tamper4 flag
  - RTC_FLAG_TAMP_5: Tamper5 flag
  - RTC_FLAG_TAMP_6: Tamper6 flag
  - RTC_FLAG_TAMP_7: Tamper7 flag
  - RTC_FLAG_TAMP_8: Tamper8 flag
  - RTC_FLAG_INT_TAMP_ALL: All Internal Tamper flags
  - RTC_FLAG_INT_TAMP_1: Internal Tamper1 flag
  - RTC_FLAG_INT_TAMP_2: Internal Tamper2 flag
  - RTC_FLAG_INT_TAMP_3: Internal Tamper3 flag
  - RTC_FLAG_INT_TAMP_4: Internal Tamper4 flag
  - RTC_FLAG_INT_TAMP_5: Internal Tamper5 flag
  - RTC_FLAG_INT_TAMP_6: Internal Tamper6 flag
  - RTC_FLAG_INT_TAMP_7: Internal Tamper7 flag
  - RTC_FLAG_INT_TAMP_8: Internal Tamper8 flag
  - RTC_FLAG_INT_TAMP_9: Internal Tamper9 flag
  - RTC_FLAG_INT_TAMP_11: Internal Tamper11 flag

Return value:

- None

RTC Timestamp

__HAL_RTC_TIMESTAMP_ENABLE

Description:

- Enable the RTC TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TIMESTAMP_DISABLE

Description:

- Disable the RTC TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TIMESTAMP_ENABLE_IT

Description:

- Enable the RTC TimeStamp interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC TimeStamp interrupt source to be enabled. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- None

__HAL_RTC_TIMESTAMP_DISABLE_IT

Description:

- Disable the RTC TimeStamp interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC TimeStamp interrupt source to be disabled. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- None

__HAL_RTC_TIMESTAMP_GET_IT

Description:

- Check whether the specified RTC TimeStamp interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC TimeStamp interrupt to check. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RTC_TIMESTAMP_GET_IT_SOURCE

Description:

- Check whether the specified RTC Time Stamp interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Time Stamp interrupt source to check. This parameter can be:
  - RTC_IT_TS TimeStamp interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RTC_TIMESTAMP_GET_FLAG

Description:

- Get the selected RTC TimeStamps flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC TimeStamp Flag is pending or not. This parameter can be:
  - RTC_FLAG_TSF
  - RTC_FLAG_TSOVF

Return value:

- The: state of __FLAG__ (TRUE or FALSE) or 255 if invalid parameter.

__HAL_RTC_TIMESTAMP_CLEAR_FLAG

Description:

- Clear the RTC Time Stamps pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC TimeStamp Flag to clear. This parameter can be:
  - RTC_FLAG_TSF
  - RTC_FLAG_TSOVF

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_ENABLE

Description:

- Enable the RTC internal TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_DISABLE

Description:

- Disable the RTC internal TimeStamp peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_GET_FLAG

Description:

- Get the selected RTC Internal Time Stamps flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Internal Time Stamp Flag is pending or not. This parameter can be:
  - RTC_FLAG_ITSF

Return value:

- None

__HAL_RTC_INTERNAL_TIMESTAMP_CLEAR_FLAG

Description:

- Clear the RTC Internal Time Stamps pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC Internal Time Stamp Flag source to clear. This parameter can be:
  - RTC_FLAG_ITSF

Return value:

- None

__HAL_RTC_TAMPTS_ENABLE

Description:

- Enable the RTC TimeStamp on Tamper detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TAMPTS_DISABLE

Description:

- Disable the RTC TimeStamp on Tamper detection.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TAMPOE_ENABLE

Description:

- Enable the RTC Tamper detection output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_TAMPOE_DISABLE

Description:

- Disable the RTC Tamper detection output.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

RTCEx TimeStamp Pin Selection

RTC_TIMESTAMPPIN_DEFAULT

RTCEx Time Stamp Edges definition

RTC_TIMESTAMPEDGE_RISING

RTC_TIMESTAMPEDGE_FALLING

RTC WakeUp Timer

__HAL_RTC_WAKEUPTIMER_ENABLE

Description:

- Enable the RTC WakeUp Timer peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_WAKEUPTIMER_DISABLE

Description:

- Disable the RTC WakeUp Timer peripheral.

Parameters:

- __HANDLE__: specifies the RTC handle.

Return value:

- None

__HAL_RTC_WAKEUPTIMER_ENABLE_IT

Description:

- Enable the RTC WakeUpTimer interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC WakeUpTimer interrupt sources to be enabled. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- None

__HAL_RTC_WAKEUPTIMER_DISABLE_IT

Description:

- Disable the RTC WakeUpTimer interrupt.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC WakeUpTimer interrupt sources to be disabled. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- None

__HAL_RTC_WAKEUPTIMER_GET_IT

Description:

- Check whether the specified RTC WakeUpTimer interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC WakeUpTimer interrupt to check. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RTC_WAKEUPTIMER_GET_IT_SOURCE

Description:

- Check whether the specified RTC Wake Up timer interrupt has been enabled or not.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __INTERRUPT__: specifies the RTC Wake Up timer interrupt sources to check. This parameter can be:
  - RTC_IT_WUT WakeUpTimer interrupt

Return value:

- The: state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RTC_WAKEUPTIMER_GET_FLAG

Description:

- Get the selected RTC WakeUpTimers flag status.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC WakeUpTimer Flag is pending or not. This parameter can be:
  - RTC_FLAG_WUTF
  - RTC_FLAG_WUTWF

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_RTC_WAKEUPTIMER_CLEAR_FLAG

Description:

- Clear the RTC Wake Up timers pending flags.

Parameters:

- __HANDLE__: specifies the RTC handle.
- __FLAG__: specifies the RTC WakeUpTimer Flag to clear. This parameter can be:
  - RTC_FLAG_WUTF

Return value:

- None

RTCEx Wakeup Timer Definitions

RTC_WAKEUPCLOCK_RTCCLK_DIV16

RTC_WAKEUPCLOCK_RTCCLK_DIV8

RTC_WAKEUPCLOCK_RTCCLK_DIV4

RTC_WAKEUPCLOCK_RTCCLK_DIV2

RTC_WAKEUPCLOCK_CK_SPRE_16BITS

RTC_WAKEUPCLOCK_CK_SPRE_17BITS

63 HAL SAI Generic Driver

63.1 SAI Firmware driver registers structures

63.1.1 SAI_PdmInitTypeDef

SAI_PdmInitTypeDef is defined in the stm32n6xx_hal_sai.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t MicPairsNbr***
- ***uint32_t ClockEnable***

Field Documentation

- ***FunctionalState SAI_PdmInitTypeDef::Activation***
  Enable/disable PDM interface
- ***uint32_t SAI_PdmInitTypeDef::MicPairsNbr***
  Specifies the number of microphone pairs used. This parameter must be a number between Min_Data = 1 and Max_Data = 3.
- ***uint32_t SAI_PdmInitTypeDef::ClockEnable***
  Specifies which clock must be enabled. This parameter can be a values combination of ***SAI_PDM_ClockEnable***

63.1.2 SAI_InitTypeDef

SAI_InitTypeDef is defined in the stm32n6xx_hal_sai.h

Data Fields

- ***uint32_t AudioMode***
- ***uint32_t Synchro***
- ***uint32_t SynchroExt***
- ***uint32_t MckOutput***
- ***uint32_t OutputDrive***
- ***uint32_t NoDivider***
- ***uint32_t FIFOThreshold***
- ***uint32_t AudioFrequency***
- ***uint32_t Mckdiv***
- ***uint32_t MckOverSampling***
- ***uint32_t MonoStereoMode***
- ***uint32_t CompandingMode***
- ***uint32_t TriState***
- ***SAI_PdmInitTypeDef PdmInit***
- ***uint32_t Protocol***
- ***uint32_t DataSize***
- ***uint32_t FirstBit***
- ***uint32_t ClockStrobing***

Field Documentation

- ***uint32_t SAI_InitTypeDef::AudioMode***
  Specifies the SAI Block audio Mode. This parameter can be a value of ***SAI_Block_Mode***
- ***uint32_t SAI_InitTypeDef::Synchro***
  Specifies SAI Block synchronization This parameter can be a value of ***SAI_Block_Synchronization***

- ***uint32_t SAI_InitTypeDef::SynchroExt***
  Specifies SAI external output synchronization, this setup is common for BlockA and BlockB This parameter can be a value of ***SAI_Block_SyncExt***
  Note:
  – If both audio blocks of same SAI are used, this parameter has to be set to the same value for each audio block
- ***uint32_t SAI_InitTypeDef::MckOutput***
  Specifies whether master clock output will be generated or not. This parameter can be a value of ***SAI_Block_MckOutput***
- ***uint32_t SAI_InitTypeDef::OutputDrive***
  Specifies when SAI Block outputs are driven. This parameter can be a value of ***SAI_Block_Output_Drive***
  Note:
  – This value has to be set before enabling the audio block but after the audio block configuration.
- ***uint32_t SAI_InitTypeDef::NoDivider***
  Specifies whether master clock will be divided or not. This parameter can be a value of ***SAI_Block_NoDivider***
  Note:
  – If bit NODIV in the SAI_xCR1 register is cleared, the frame length should be aligned to a number equal to a power of 2, from 8 to 256. If bit NODIV in the SAI_xCR1 register is set, the frame length can take any of the values from 8 to 256.
- ***uint32_t SAI_InitTypeDef::FIFOThreshold***
  Specifies SAI Block FIFO threshold. This parameter can be a value of ***SAI_Block_Fifo_Threshold***
- ***uint32_t SAI_InitTypeDef::AudioFrequency***
  Specifies the audio frequency sampling. This parameter can be a value of ***SAI_Audio_Frequency***
- ***uint32_t SAI_InitTypeDef::Mckdiv***
  Specifies the master clock divider. This parameter must be a number between Min_Data = 0 and Max_Data = 63.
  Note:
  – This parameter is used only if AudioFrequency is set to SAI_AUDIO_FREQUENCY_MCKDIV otherwise it is internally computed.
- ***uint32_t SAI_InitTypeDef::MckOverSampling***
  Specifies the master clock oversampling. This parameter can be a value of ***SAI_Block_Mck_OverSampling***
- ***uint32_t SAI_InitTypeDef::MonoStereoMode***
  Specifies if the mono or stereo mode is selected. This parameter can be a value of ***SAI_Mono_Stereo_Mode***
- ***uint32_t SAI_InitTypeDef::CompandingMode***
  Specifies the companding mode type. This parameter can be a value of ***SAI_Block_Companding_Mode***
- ***uint32_t SAI_InitTypeDef::TriState***
  Specifies the companding mode type. This parameter can be a value of ***SAI_TRIState_Management***
- ***SAI_PdmInitTypeDef SAI_InitTypeDef::PdmInit***
  Specifies the PDM configuration.
- ***uint32_t SAI_InitTypeDef::Protocol***
  Specifies the SAI Block protocol. This parameter can be a value of ***SAI_Block_Protocol***
- ***uint32_t SAI_InitTypeDef::DataSize***
  Specifies the SAI Block data size. This parameter can be a value of ***SAI_Block_Data_Size***
- ***uint32_t SAI_InitTypeDef::FirstBit***
  Specifies whether data transfers start from MSB or LSB bit. This parameter can be a value of ***SAI_Block_MSB_LSB_transmission***
- ***uint32_t SAI_InitTypeDef::ClockStrobing***
  Specifies the SAI Block clock strobing edge sensitivity. This parameter can be a value of ***SAI_Block_Clock_Strobing***

63.1.3 SAI_FrameInitTypeDef

SAI_FrameInitTypeDef is defined in the stm32n6xx_hal_sai.h

Data Fields

- ***uint32_t FrameLength***
- ***uint32_t ActiveFrameLength***
- ***uint32_t FSDefinition***
- ***uint32_t FSPolarity***
- ***uint32_t FSOffset***

Field Documentation

- ***uint32_t SAI_FrameInitTypeDef::FrameLength***
  Specifies the Frame length, the number of SCK clocks for each audio frame. This parameter must be a number between Min_Data = 8 and Max_Data = 256.
  Note:
  – If master clock MCLK_x pin is declared as an output, the frame length should be aligned to a number equal to power of 2 in order to keep in an audio frame, an integer number of MCLK pulses by bit Clock.
- ***uint32_t SAI_FrameInitTypeDef::ActiveFrameLength***
  Specifies the Frame synchronization active level length. This Parameter specifies the length in number of bit clock (SCK + 1) of the active level of FS signal in audio frame. This parameter must be a number between Min_Data = 1 and Max_Data = 128
- ***uint32_t SAI_FrameInitTypeDef::FSDefinition***
  Specifies the Frame synchronization definition. This parameter can be a value of ***SAI_Block_FS_Definition***
- ***uint32_t SAI_FrameInitTypeDef::FSPolarity***
  Specifies the Frame synchronization Polarity. This parameter can be a value of ***SAI_Block_FS_Polarity***
- ***uint32_t SAI_FrameInitTypeDef::FSOffset***
  Specifies the Frame synchronization Offset. This parameter can be a value of ***SAI_Block_FS_Offset***

63.1.4 SAI_SlotInitTypeDef

SAI_SlotInitTypeDef is defined in the stm32n6xx_hal_sai.h

Data Fields

- ***uint32_t FirstBitOffset***
- ***uint32_t SlotSize***
- ***uint32_t SlotNumber***
- ***uint32_t SlotActive***

Field Documentation

- ***uint32_t SAI_SlotInitTypeDef::FirstBitOffset***
  Specifies the position of first data transfer bit in the slot. This parameter must be a number between Min_Data = 0 and Max_Data = 24
- ***uint32_t SAI_SlotInitTypeDef::SlotSize***
  Specifies the Slot Size. This parameter can be a value of ***SAI_Block_Slot_Size***
- ***uint32_t SAI_SlotInitTypeDef::SlotNumber***
  Specifies the number of slot in the audio frame. This parameter must be a number between Min_Data = 1 and Max_Data = 16
- ***uint32_t SAI_SlotInitTypeDef::SlotActive***
  Specifies the slots in audio frame that will be activated. This parameter can be a value of ***SAI_Block_Slot_Active***

63.1.5 __SAI_HandleTypeDef

__SAI_HandleTypeDef is defined in the stm32n6xx_hal_sai.h

Data Fields

- ***SAI_Block_TypeDef * Instance***
- ***SAI_InitTypeDef Init***
- ***SAI_FrameInitTypeDef FrameInit***
- ***SAI_SlotInitTypeDef SlotInit***
- ***uint8_t * pBuffPtr***
- ***uint16_t XferSize***

- ***uint16_t XferCount***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***SAIcallback mutecallback***
- ***void(* InterruptServiceRoutine***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_SAI_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* RxCpltCallback***
- ***void(* RxHalfCpltCallback***
- ***void(* TxCpltCallback***
- ***void(* TxHalfCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***SAI_Block_TypeDef* __SAI_HandleTypeDef::Instance***
  SAI Blockx registers base address
- ***SAI_InitTypeDef __SAI_HandleTypeDef::Init***
  SAI communication parameters
- ***SAI_FrameInitTypeDef __SAI_HandleTypeDef::FrameInit***
  SAI Frame configuration parameters
- ***SAI_SlotInitTypeDef __SAI_HandleTypeDef::SlotInit***
  SAI Slot configuration parameters
- ***uint8_t* __SAI_HandleTypeDef::pBuffPtr***
  Pointer to SAI transfer Buffer
- ***uint16_t __SAI_HandleTypeDef::XferSize***
  SAI transfer size
- ***uint16_t __SAI_HandleTypeDef::XferCount***
  SAI transfer counter
- ***DMA_HandleTypeDef* __SAI_HandleTypeDef::hdmatx***
  SAI Tx DMA handle parameters
- ***DMA_HandleTypeDef* __SAI_HandleTypeDef::hdmarx***
  SAI Rx DMA handle parameters
- ***SAIcallback __SAI_HandleTypeDef::mutecallback***
  SAI mute callback
- ***void(* __SAI_HandleTypeDef::InterruptServiceRoutine)(struct __SAI_HandleTypeDef *hsai)***
- ***HAL_LockTypeDef __SAI_HandleTypeDef::Lock***
  SAI locking object
- ***__IO HAL_SAI_StateTypeDef __SAI_HandleTypeDef::State***
  SAI communication state
- ***__IO uint32_t __SAI_HandleTypeDef::ErrorCode***
  SAI Error code
- ***void(* __SAI_HandleTypeDef::RxCpltCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI receive complete callback
- ***void(* __SAI_HandleTypeDef::RxHalfCpltCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI receive half complete callback
- ***void(* __SAI_HandleTypeDef::TxCpltCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI transmit complete callback
- ***void(* __SAI_HandleTypeDef::TxHalfCpltCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI transmit half complete callback
- ***void(* __SAI_HandleTypeDef::ErrorCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI error callback

- ***void(* __SAI_HandleTypeDef::MspInitCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI MSP init callback
- ***void(* __SAI_HandleTypeDef::MspDeInitCallback)(struct __SAI_HandleTypeDef *hsai)***
  SAI MSP de-init callback

63.2 SAI Firmware driver API description

The following section lists the various functions of the SAI library.

63.2.1 How to use this driver

The SAI HAL driver can be used as follows:

1. Declare a SAI_HandleTypeDef handle structure (eg. SAI_HandleTypeDef hsai).
2. Initialize the SAI low level resources by implementing the HAL_SAI_MspInit() API:
   a. Enable the SAI interface clock.
   b. SAI pins configuration:
      - Enable the clock for the SAI GPIOs.
      - Configure these SAI pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_SAI_Transmit_IT() and HAL_SAI_Receive_IT() APIs):
      - Configure the SAI interrupt priority.
      - Enable the NVIC SAI IRQ handle.
   d. DMA Configuration if you need to use DMA process (HAL_SAI_Transmit_DMA() and HAL_SAI_Receive_DMA() APIs):
      - Declare a DMA handle structure for the Tx/Rx stream.
      - Enable the DMAx interface clock.
      - Configure the declared DMA handle structure with the required Tx/Rx parameters.
      - Configure the DMA Tx/Rx Stream.
      - Associate the initialized DMA handle to the SAI DMA Tx/Rx handle.
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx Stream.
3. The initialization can be done by two ways
   a. Expert mode : Initialize the structures Init, FrameInit and SlotInit and call HAL_SAI_Init().
   b. Simplified mode : Initialize the high part of Init Structure and call HAL_SAI_InitProtocol().

Note: The specific SAI interrupts (FIFO request and Overrun underrun interrupt) will be managed using the macros __HAL_SAI_ENABLE_IT() and __HAL_SAI_DISABLE_IT() inside the transmit and receive process.

Note: Make sure that either:

- *PLLSAI1CLK output is configured or*
- *PLLSAI2CLK output is configured or*
- *PLLSAI3CLK output is configured or*
- *External clock source is configured after setting correctly the define constant EXTERNAL_SAI1_CLOCK_VALUE or EXTERNAL_SAI2_CLOCK_VALUE in the stm32n6xx_hal_conf.h file.*

Note: In master Tx mode: enabling the audio block immediately generates the bit clock for the external slaves even if there is no data in the FIFO, However FS signal generation is conditioned by the presence of data in the FIFO.

Note: In master Rx mode: enabling the audio block immediately generates the bit clock and FS signal for the external slaves.

Note: It is mandatory to respect the following conditions in order to avoid bad SAI behavior:

- *First bit Offset <= (SLOT size - Data size)*
- *Data size <= SLOT size*
- *Number of SLOT x SLOT size = Frame length*
- *The number of slots should be even when SAI_FS_CHANNEL_IDENTIFICATION is selected.*

Note: PDM interface can be activated through HAL_SAI_Init function. Please note that PDM interface is only available for SAI1 sub-block A. PDM microphone delays can be tuned with HAL_SAIEx_ConfigPdmMicDelay function.

Three operation modes are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_SAI_Transmit()
- Receive an amount of data in blocking mode using HAL_SAI_Receive()

Interrupt mode IO operation

- Send an amount of data in non-blocking mode using HAL_SAI_Transmit_IT()
- At transmission end of transfer HAL_SAI_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL_SAI_Receive_IT()
- At reception end of transfer HAL_SAI_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_RxCpltCallback()
- In case of flag error, HAL_SAI_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SAI_ErrorCallback()

DMA mode IO operation

- Send an amount of data in non-blocking mode (DMA) using HAL_SAI_Transmit_DMA()
- At transmission end of transfer HAL_SAI_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL_SAI_Receive_DMA()
- At reception end of transfer HAL_SAI_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SAI_RxCpltCallback()
- In case of flag error, HAL_SAI_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SAI_ErrorCallback()
- Pause the DMA Transfer using HAL_SAI_DMAPause()
- Resume the DMA Transfer using HAL_SAI_DMAResume()
- Stop the DMA Transfer using HAL_SAI_DMAStop()

SAI HAL driver additional function list

Below the list the others API available SAI HAL driver :

- HAL_SAI_EnableTxMuteMode(): Enable the mute in tx mode
- HAL_SAI_DisableTxMuteMode(): Disable the mute in tx mode
- HAL_SAI_EnableRxMuteMode(): Enable the mute in Rx mode
- HAL_SAI_DisableRxMuteMode(): Disable the mute in Rx mode
- HAL_SAI_FlushRxFifo(): Flush the rx fifo.
- HAL_SAI_Abort(): Abort the current transfer

SAI HAL driver macros list

Below the list of most used macros in SAI HAL driver :

- __HAL_SAI_ENABLE(): Enable the SAI peripheral
- __HAL_SAI_DISABLE(): Disable the SAI peripheral
- __HAL_SAI_ENABLE_IT(): Enable the specified SAI interrupts
- __HAL_SAI_DISABLE_IT(): Disable the specified SAI interrupts
- __HAL_SAI_GET_IT_SOURCE(): Check if the specified SAI interrupt source is enabled or disabled
- __HAL_SAI_GET_FLAG(): Check whether the specified SAI flag is set or not

Callback registration

The compilation define USE_HAL_SAI_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_SAI_RegisterCallback() to register a user callback.

Function HAL_SAI_RegisterCallback() allows to register following callbacks:

- RxCpltCallback : SAI receive complete.
- RxHalfCpltCallback : SAI receive half complete.
- TxCpltCallback : SAI transmit complete.
- TxHalfCpltCallback : SAI transmit half complete.
- ErrorCallback : SAI error.
- MspInitCallback : SAI MspInit.
- MspDeInitCallback : SAI MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_SAI_UnRegisterCallback() to reset a callback to the default weak function. HAL_SAI_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the callback ID.

This function allows to reset following callbacks:

- RxCpltCallback : SAI receive complete.
- RxHalfCpltCallback : SAI receive half complete.
- TxCpltCallback : SAI transmit complete.
- TxHalfCpltCallback : SAI transmit half complete.
- ErrorCallback : SAI error.
- MspInitCallback : SAI MspInit.
- MspDeInitCallback : SAI MspDeInit.

By default, after the HAL_SAI_Init and if the state is HAL_SAI_STATE_RESET all callbacks are reset to the corresponding legacy weak functions: examples HAL_SAI_RxCpltCallback(), HAL_SAI_ErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the HAL_SAI_Init and HAL_SAI_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_SAI_Init and HAL_SAI_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_SAI_RegisterCallback before calling HAL_SAI_DeInit or HAL_SAI_Init function.

When the compilation define USE_HAL_SAI_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

63.2.2 Detailed description of functions

HAL_SAI_InitProtocol

Function name

HAL_StatusTypeDef HAL_SAI_InitProtocol (SAI_HandleTypeDef * hsai, uint32_t protocol, uint32_t datasize, uint32_t nbslot)

SAI Exported Macros

__HAL_SAI_RESET_HANDLE_STATE

Description:

- Reset SAI handle state.

Parameters:

- __HANDLE__: specifies the SAI Handle.

Return value:

- None

__HAL_SAI_ENABLE_IT

Description:

- Enable the specified SAI interrupts.

Parameters:

- __HANDLE__: specifies the SAI Handle.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - SAI_IT_OVRUDR: Overrun underrun interrupt enable
  - SAI_IT_MUTEDET: Mute detection interrupt enable
  - SAI_IT_WCKCFG: Wrong Clock Configuration interrupt enable
  - SAI_IT_FREQ: FIFO request interrupt enable
  - SAI_IT_CNRDY: Codec not ready interrupt enable
  - SAI_IT_AFSDET: Anticipated frame synchronization detection interrupt enable
  - SAI_IT_LFSDET: Late frame synchronization detection interrupt enable

Return value:

- None

__HAL_SAI_DISABLE_IT

Description:

- Disable the specified SAI interrupts.

Parameters:

- __HANDLE__: specifies the SAI Handle.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - SAI_IT_OVRUDR: Overrun underrun interrupt enable
  - SAI_IT_MUTEDET: Mute detection interrupt enable
  - SAI_IT_WCKCFG: Wrong Clock Configuration interrupt enable
  - SAI_IT_FREQ: FIFO request interrupt enable
  - SAI_IT_CNRDY: Codec not ready interrupt enable
  - SAI_IT_AFSDET: Anticipated frame synchronization detection interrupt enable
  - SAI_IT_LFSDET: Late frame synchronization detection interrupt enable

Return value:

- None

__HAL_SAI_GET_IT_SOURCE

Description:

- Check whether the specified SAI interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the SAI Handle.
- __INTERRUPT__: specifies the SAI interrupt source to check. This parameter can be one of the following values:
  - SAI_IT_OVRUDR: Overrun underrun interrupt enable
  - SAI_IT_MUTEDET: Mute detection interrupt enable
  - SAI_IT_WCKCFG: Wrong Clock Configuration interrupt enable
  - SAI_IT_FREQ: FIFO request interrupt enable
  - SAI_IT_CNRDY: Codec not ready interrupt enable
  - SAI_IT_AFSDET: Anticipated frame synchronization detection interrupt enable
  - SAI_IT_LFSDET: Late frame synchronization detection interrupt enable

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_SAI_GET_FLAG

Description:

- Check whether the specified SAI flag is set or not.

Parameters:

- __HANDLE__: specifies the SAI Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SAI_FLAG_OVRUDR: Overrun underrun flag.
  - SAI_FLAG_MUTEDET: Mute detection flag.
  - SAI_FLAG_WCKCFG: Wrong Clock Configuration flag.
  - SAI_FLAG_FREQ: FIFO request flag.
  - SAI_FLAG_CNRDY: Codec not ready flag.
  - SAI_FLAG_AFSDET: Anticipated frame synchronization detection flag.
  - SAI_FLAG_LFSDET: Late frame synchronization detection flag.

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_SAI_CLEAR_FLAG

Description:

- Clear the specified SAI pending flag.

Parameters:

- __HANDLE__: specifies the SAI Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - SAI_FLAG_OVRUDR: Clear Overrun underrun
  - SAI_FLAG_MUTEDET: Clear Mute detection
  - SAI_FLAG_WCKCFG: Clear Wrong Clock Configuration
  - SAI_FLAG_FREQ: Clear FIFO request
  - SAI_FLAG_CNRDY: Clear Codec not ready
  - SAI_FLAG_AFSDET: Clear Anticipated frame synchronization detection
  - SAI_FLAG_LFSDET: Clear Late frame synchronization detection

Return value:

- None

__HAL_SAI_ENABLE

Description:

- Enable SAI.

Parameters:

- __HANDLE__: specifies the SAI Handle.

Return value:

- None

__HAL_SAI_DISABLE

Description:

- Disable SAI.

Parameters:

- __HANDLE__: specifies the SAI Handle.

Return value:

- None

  Specifies the delay in PDM clock unit to apply on right microphone. This parameter must be a number between Min_Data = 0 and Max_Data = 7.

64.2 SAIEx Firmware driver API description

The following section lists the various functions of the SAIEx library.

64.2.1 Detailed description of functions

HAL_SAIEx_ConfigPdmMicDelay

Function name

HAL_StatusTypeDef HAL_SAIEx_ConfigPdmMicDelay (const SAI_HandleTypeDef * hsai, const SAIEx_PdmMicDelayParamTypeDef * pdmMicDelay)

Function description

65 HAL SDIO Generic Driver

65.1 SDIO Firmware driver registers structures

65.1.1 HAL_SDIO_CCCR_TypeDef

HAL_SDIO_CCCR_TypeDef is defined in the stm32n6xx_hal_sdio.h

Data Fields

- ***uint8_t sdio_revision***
- ***uint8_t cccr_revision***
- ***uint8_t sd_spec_revision***
- ***uint8_t bus_width_8Bit***
- ***uint32_t card_capability***
- ***uint32_t commonCISPointer***

Field Documentation

- ***uint8_t HAL_SDIO_CCCR_TypeDef::sdio_revision***
  SDIO revision
- ***uint8_t HAL_SDIO_CCCR_TypeDef::cccr_revision***
  CCCR version
- ***uint8_t HAL_SDIO_CCCR_TypeDef::sd_spec_revision***
  SD revision
- ***uint8_t HAL_SDIO_CCCR_TypeDef::bus_width_8Bit***
  SDIO bus width 8 bit support
- ***uint32_t HAL_SDIO_CCCR_TypeDef::card_capability***
  SDIO card capability
- ***uint32_t HAL_SDIO_CCCR_TypeDef::commonCISPointer***
  point to common CIS

65.1.2 HAL_SDIO_FBR_t

HAL_SDIO_FBR_t is defined in the stm32n6xx_hal_sdio.h

Data Fields

- ***uint8_t flags***
- ***uint8_t ioStdFunctionCode***
- ***uint8_t ioExtFunctionCode***
- ***uint32_t ioPointerToCIS***
- ***uint32_t ioPointerToCSA***

Field Documentation

- ***uint8_t HAL_SDIO_FBR_t::flags***
  SDIO current IO flags
- ***uint8_t HAL_SDIO_FBR_t::ioStdFunctionCode***
  SDIO current IO standard function code
- ***uint8_t HAL_SDIO_FBR_t::ioExtFunctionCode***
  SDIO current IO extended function code
- ***uint32_t HAL_SDIO_FBR_t::ioPointerToCIS***
  SDIO current IO pointer to CIS
- ***uint32_t HAL_SDIO_FBR_t::ioPointerToCSA***
  SDIO current IO pointer to CSA

65.1.3 HAL_SDIO_DirectCmd_TypeDef

HAL_SDIO_DirectCmd_TypeDef is defined in the stm32n6xx_hal_sdio.h

Data Fields

- ***uint32_t Reg_Addr***
- ***uint8_t ReadAfterWrite***
- ***uint8_t IOFunctionNbr***

Field Documentation

- ***uint32_t HAL_SDIO_DirectCmd_TypeDef::Reg_Addr***
  This is the address of the byte of data inside of the selected function to read or write
- ***uint8_t HAL_SDIO_DirectCmd_TypeDef::ReadAfterWrite***
  This is the read after write flag, it is used for write access only.
- ***uint8_t HAL_SDIO_DirectCmd_TypeDef::IOFunctionNbr***
  The number of the function within the IO card you wish to read or write

65.1.4 HAL_SDIO_ExtendedCmd_TypeDef

HAL_SDIO_ExtendedCmd_TypeDef is defined in the stm32n6xx_hal_sdio.h

Data Fields

- ***uint32_t Reg_Addr***
- ***uint32_t OpCode***
- ***uint32_t Block_Mode***
- ***uint32_t IOFunctionNbr***

Field Documentation

- ***uint32_t HAL_SDIO_ExtendedCmd_TypeDef::Reg_Addr***
  This is the address of the byte of data inside of the selected function to read or write
- ***uint32_t HAL_SDIO_ExtendedCmd_TypeDef::OpCode***
  Read/Write operation mode
- ***uint32_t HAL_SDIO_ExtendedCmd_TypeDef::Block_Mode***
  Bytes or Blocks mode
- ***uint32_t HAL_SDIO_ExtendedCmd_TypeDef::IOFunctionNbr***
  The number of the function within the IO card you wish to read or write

65.1.5 __SDIO_HandleTypeDef

__SDIO_HandleTypeDef is defined in the stm32n6xx_hal_sdio.h

Data Fields

- ***SDIO_TypeDef * Instance***
- ***SDIO_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***

65.2 SDIO Firmware driver API description

The following section lists the various functions of the SDIO library.

65.2.1 How to use this driver

This driver implements a high level communication layer for read and write from/to this SDIO card. The needed STM32 hardware resources (SDMMC and GPIO) are performed by the user in HAL_SDIO_MspInit() function (MSP layer). Basically, the MSP layer configuration should be the same as we provide in the examples. You can easily tailor this configuration according to hardware resources.

This driver is a generic layered driver for SDMMC memories which uses the HAL SDMMC driver functions to interface with SDIO cards devices. It is used as follows:

1. Initialize the SDMMC low level resources by implementing the HAL_SDIO_MspInit() API:
   a. Enable the SDMMC interface clock using __HAL_RCC_SDMMC_CLK_ENABLE();
   b. SDMMC pins configuration for SDIO card
      - Enable the clock for the SDMMC GPIOs using the functions __HAL_RCC_GPIOx_CLK_ENABLE();
      - Configure these SDMMC pins as alternate function pull-up using HAL_GPIO_Init() and according to your pin assignment;
   c. NVIC configuration if you need to use interrupt process (HAL_SDIO_ReadExtended_DMA() and HAL_SDIO_WriteExtended_DMA() APIs).
      - Configure the SDMMC interrupt priorities using function HAL_NVIC_SetPriority();
      - Enable the NVIC SDMMC IRQs using function HAL_NVIC_EnableIRQ()
      - SDMMC interrupts are managed using the macros __HAL_SDIO_ENABLE_IT() and __HAL_SDIO_DISABLE_IT() inside the communication process.
      - SDMMC interrupts pending bits are managed using the macros __HAL_SDIO_GET_IT().
   d. No general propose DMA Configuration is needed, an Internal DMA for SDMMC Peripheral are used.
2. At this stage, you can perform SDIO read/write/erase operations after SDIO card initialization.

SDIO Card Initialization and configuration

To initialize the SDIO Card, use the HAL_SDIO_Init() function. It Initializes SDMMC Peripheral(STM32 side) and the SDIO Card, and put it into StandBy State (Ready for data transfer). This function provide the following operations:

1. Apply the SDIO Card initialization process at 400KHz. You can change or adapt this frequency by adjusting the "ClockDiv" field. The SDIO Card frequency (SDMMC_CK) is computed as follows: SDMMC_CK = SDMMCCLK / (2 * ClockDiv) In initialization mode and according to the SDIO Card standard, make sure that the SDMMC_CK frequency doesn't exceed 400KHz. This phase of initialization is done through SDMMC_Init() and SDMMC_PowerState_ON() SDMMC low level APIs.
2. Initialize the SDIO card. The API used is HAL_SDIO_Init(). This phase allows the card initialization and identification.
3. Configure the SDIO Card Data transfer frequency. You can change or adapt this frequency by adjusting the "ClockDiv" field by the API HAL_SDIO_ConfigFrequency().
4. Configure the SDIO Card in wide bus mode: 4-bits data by the API HAL_SDIO_SetDataBusWidth().
5. Configure the SDIO Card data block size by the API : HAL_SDIO_SetBlockSize().
6. Configure the SDIO Card speed mode by the API : HAL_SDIO_SetSpeedMode().
7. To custumize the SDIO Init card function for the enumeration card sequence, you can register a user callback function by calling the HAL_SDIO_RegisterIdentifyCardCallback before the HAL_SDIO_Init() function.

SDIO Card Read operation

- You can read from SDIO card in polling mode by using function HAL_SDIO_ReadExtended(). This function support only 2048-bytes block length (the block size should be chosen by using the API HAL_SDIO_SetBlockSize).
- You can read from SDIO card in DMA mode by using function HAL_SDIO_ReadExtended_DMA(). This function support only 2048-bytes block length (the block size should be chosen by using the API HAL_SDIO_SetBlockSize). After this, you have to ensure that the transfer is done correctly. You could also check the DMA transfer process through the SDIO Rx interrupt event.

SDIO Card Write operation

- You can write to SDIO card in polling mode by using function HAL_SDIO_WriteExtended(). This function support only 2048-bytes block length (the block size should be chosen by using the API HAL_SDIO_SetBlockSize).

- You can write to SDIO card in DMA mode by using function HAL_SDIO_WriteExtended_DMA(). This function support only 2048-bytes block length (the block size should be chosen by using the API HAL_SDIO_SetBlockSize). You could also check the DMA transfer process through the SDIO Tx interrupt event.

SDIO card common control register (CCCR)

- The SDIO CCCR allow for quick host checking and control of an IO card's enable and interrupts on a per card and per function basis. To get the Card common control registers field, you can use the API HAL_SDIO_GetCardCommonControlRegister().

SDIO card Function basic register (FBR)

- The SDIO card function basic register are used to allow the host to quickly determine the abilities and requirements of each function.
- To get the SDIO function basic register information, you can use the API HAL_SDIO_GetCardFBRRegister().

SDIO HAL driver macros list

Note: You can refer to the SDIO HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_SDIO_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_SDIO_RegisterCallback() to register a user callback, it allows to register following callbacks:

- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- MspInitCallback : SDIO MspInit.
- MspDeInitCallback : SDIO MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. For specific callbacks TransceiverCallback use dedicated register callbacks: respectively HAL_SDIO_RegisterTransceiverCallback(). Use function HAL_SDIO_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- MspInitCallback : SDIO MspInit.
- MspDeInitCallback : SDIO MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. For specific callbacks TransceiverCallback use dedicated unregister callbacks: respectively HAL_SDIO_UnRegisterTransceiverCallback(). By default, after the HAL_SDIO_Init and if the state is HAL_SDIO_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_SDIO_Init and HAL_SDIO_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_SDIO_Init and HAL_SDIO_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_SDIO_RegisterCallback before calling HAL_SDIO_DeInit or HAL_SDIO_Init function. When The compilation define USE_HAL_SDIO_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

SDIO peripheral IO interrupt

- Below the list of most used SDIO function to check and control the IO card's enable and interrupts on a per functions basis.
- HAL_SDIO_EnableIOFunctionInterrupt: Enable SDIO IO interrupt.

- HAL_SDIO_DisableIOFunctionInterrupt: Disable SDIO IO interrupt.
- HAL_SDIO_EnableIOFunction: Enable Function number(0-7)
- HAL_SDIO_DisableIOFunction: Disable Function number(0-7)
- HAL_SDIO_SelectIOFunction: Select a function number(0-7)
- HAL_SDIO_AbortIOFunction: Abort an IO read or write operation and free the SDIO bus.
- HAL_SDIO_EnableIOAsynInterrupt: Enable Bit of asynchronous interrupt
- HAL_SDIO_DisableIOAsynInterrupt: Disable Bit of asynchronous interrupt

SDIO Exported Macros

__HAL_SDIO_ENABLE_IT

Description:

- Enable the SDIO device interrupt.

Parameters:

- __HANDLE__: SDIO Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be enabled.

Return value:

- None

__HAL_SDIO_DISABLE_IT

Description:

- Disable the SDIO device interrupt.

Parameters:

- __HANDLE__: SDIO Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be disabled.

Return value:

- None

__HAL_SDIO_GET_FLAG

Description:

- Check whether the specified SDIO flag is set or not.

Parameters:

- __HANDLE__: SDIO Handle.
- __FLAG__: specifies the flag to check.

Return value:

- The: new state of SDIO FLAG (SET or RESET).

__HAL_SDIO_CLEAR_FLAG

Description:

- Clear the SDIO's pending flags.

Parameters:

- __HANDLE__: SDIO Handle.
- __FLAG__: specifies the flag to clear.

Return value:

- None

__HAL_SDIO_GET_IT

Description:

- Check whether the specified SDIO interrupt has occurred or not.

Parameters:

- __HANDLE__: SDIO Handle.
- __INTERRUPT__: specifies the SDMMC interrupt source to check.

Return value:

- The: new state of SDIO IT (SET or RESET).

__HAL_SDIO_GET_IT_SOURCE

Description:

- Checks whether the specified SDIO interrupt is enabled or not.

Parameters:

- __HANDLE__: : SDIO handle.
- __INTERRUPT__: : specifies the SDMMC interrupt source to check.

Return value:

- The: state of SDIO IT (SET or RESET).

66.2 SDRAM Firmware driver API description

The following section lists the various functions of the SDRAM library.

66.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control SDRAM memories. It uses the FMC layer functions to interface with SDRAM devices. The following sequence should be followed to configure the FMC to interface with SDRAM memories:

1. Declare a SDRAM_HandleTypeDef handle structure, for example: SDRAM_HandleTypeDef hsdram
   – Fill the SDRAM_HandleTypeDef handle "Init" field with the allowed values of the structure member.
   – Fill the SDRAM_HandleTypeDef handle "Instance" field with a predefined base register instance for NOR or SDRAM device

2. Declare a FMC_SDRAM_TimingTypeDef structure; for example: FMC_SDRAM_TimingTypeDef Timing; and fill its fields with the allowed values of the structure member.
3. Initialize the SDRAM Controller by calling the function HAL_SDRAM_Init(). This function performs the following sequence:
   a. MSP hardware layer configuration using the function HAL_SDRAM_MspInit()
   b. Control register configuration using the FMC SDRAM interface function FMC_SDRAM_Init()
   c. Timing register configuration using the FMC SDRAM interface function FMC_SDRAM_Timing_Init()
   d. Program the SDRAM external device by applying its initialization sequence according to the device plugged in your hardware. This step is mandatory for accessing the SDRAM device.
4. At this stage you can perform read/write accesses from/to the memory connected to the SDRAM Bank. You can perform either polling or DMA transfer using the following APIs:
   – HAL_SDRAM_Read()/HAL_SDRAM_Write() for polling read/write access
   – HAL_SDRAM_Read_DMA()/HAL_SDRAM_Write_DMA() for DMA read/write transfer
5. You can also control the SDRAM device by calling the control APIs HAL_SDRAM_WriteOperation_Enable()/ HAL_SDRAM_WriteOperation_Disable() to respectively enable/disable the SDRAM write operation or the function HAL_SDRAM_SendCommand() to send a specified command to the SDRAM device. The command to be sent must be configured with the FMC_SDRAM_CommandTypeDef structure.
6. You can continuously monitor the SDRAM device HAL state by calling the function HAL_SDRAM_GetState()

Callback registration

The compilation define USE_HAL_SDRAM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_SDRAM_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : SDRAM MspInit.
- MspDeInitCallback : SDRAM MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_SDRAM_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- MspInitCallback : SDRAM MspInit.
- MspDeInitCallback : SDRAM MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_SDRAM_Init and if the state is HAL_SDRAM_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_SDRAM_Init and HAL_SDRAM_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_SDRAM_Init and HAL_SDRAM_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/ unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/ unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_SDRAM_RegisterCallback before calling HAL_SDRAM_DeInit or HAL_SDRAM_Init function. When The compilation define USE_HAL_SDRAM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

66.2.2 Detailed description of functions

HAL_SDRAM_Init

Function name

HAL_StatusTypeDef HAL_SDRAM_Init (SDRAM_HandleTypeDef * hsdram, FMC_SDRAM_TimingTypeDef * Timing)

Function description

HAL_SDRAM_DeInit

Function name

Function description

66.3 SDRAM Firmware driver defines

The following section lists the various define and macros of the module.

66.3.1 SDRAM

SDRAM

SDRAM Exported Macros

__HAL_SDRAM_RESET_HANDLE_STATE

Description:

- Reset SDRAM handle state.

Parameters:

- __HANDLE__: specifies the SDRAM handle.

Return value:

- None

67 HAL SD Generic Driver

67.1 SD Firmware driver registers structures

67.1.1 HAL_SD_CardInfoTypeDef

HAL_SD_CardInfoTypeDef is defined in the stm32n6xx_hal_sd.h

Data Fields

- ***uint32_t CardType***
- ***uint32_t CardVersion***
- ***uint32_t Class***
- ***uint32_t RelCardAdd***
- ***uint32_t BlockNbr***
- ***uint32_t BlockSize***
- ***uint32_t LogBlockNbr***
- ***uint32_t LogBlockSize***
- ***uint32_t CardSpeed***

Field Documentation

- ***uint32_t HAL_SD_CardInfoTypeDef::CardType***
  Specifies the card Type
- ***uint32_t HAL_SD_CardInfoTypeDef::CardVersion***
  Specifies the card version
- ***uint32_t HAL_SD_CardInfoTypeDef::Class***
  Specifies the class of the card class
- ***uint32_t HAL_SD_CardInfoTypeDef::RelCardAdd***
  Specifies the Relative Card Address
- ***uint32_t HAL_SD_CardInfoTypeDef::BlockNbr***
  Specifies the Card Capacity in blocks
- ***uint32_t HAL_SD_CardInfoTypeDef::BlockSize***
  Specifies one block size in bytes
- ***uint32_t HAL_SD_CardInfoTypeDef::LogBlockNbr***
  Specifies the Card logical Capacity in blocks
- ***uint32_t HAL_SD_CardInfoTypeDef::LogBlockSize***
  Specifies logical block size in bytes
- ***uint32_t HAL_SD_CardInfoTypeDef::CardSpeed***
  Specifies the card Speed

67.1.2 __SD_HandleTypeDef

__SD_HandleTypeDef is defined in the stm32n6xx_hal_sd.h

Data Fields

- ***SD_TypeDef * Instance***
- ***SD_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***

Field Documentation

- ***__IO uint8_t HAL_SD_CardStatusTypeDef::DataBusWidth***
  Shows the currently defined data bus width
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::SecuredMode***
  Card is in secured mode of operation
- ***__IO uint16_t HAL_SD_CardStatusTypeDef::CardType***
  Carries information about card type
- ***__IO uint32_t HAL_SD_CardStatusTypeDef::ProtectedAreaSize***
  Carries information about the capacity of protected area
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::SpeedClass***
  Carries information about the speed class of the card
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::PerformanceMove***
  Carries information about the card's performance move
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::AllocationUnitSize***
  Carries information about the card's allocation unit size
- ***__IO uint16_t HAL_SD_CardStatusTypeDef::EraseSize***
  Determines the number of AUs to be erased in one operation
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::EraseTimeout***
  Determines the timeout for any number of AU erase
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::EraseOffset***
  Carries information about the erase offset
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::UhsSpeedGrade***
  Carries information about the speed grade of UHS card
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::UhsAllocationUnitSize***
  Carries information about the UHS card's allocation unit size
- ***__IO uint8_t HAL_SD_CardStatusTypeDef::VideoSpeedClass***
  Carries information about the Video Speed Class of UHS card

67.2 SD Firmware driver API description

The following section lists the various functions of the SD library.

67.2.1 How to use this driver

This driver implements a high level communication layer for read and write from/to this memory. The needed STM32 hardware resources (SDMMC and GPIO) are performed by the user in HAL_SD_MspInit() function (MSP layer). Basically, the MSP layer configuration should be the same as we provide in the examples. You can easily tailor this configuration according to hardware resources.

This driver is a generic layered driver for SDMMC memories which uses the HAL SDMMC driver functions to interface with SD and uSD cards devices. It is used as follows:

1. Initialize the SDMMC low level resources by implementing the HAL_SD_MspInit() API:
   a. Enable the SDMMC interface clock using __HAL_RCC_SDMMC_CLK_ENABLE();
   b. SDMMC pins configuration for SD card
      - Enable the clock for the SDMMC GPIOs using the functions __HAL_RCC_GPIOx_CLK_ENABLE();
      - Configure these SDMMC pins as alternate function pull-up using HAL_GPIO_Init() and according to your pin assignment;
   c. NVIC configuration if you need to use interrupt process (HAL_SD_ReadBlocks_IT() and HAL_SD_WriteBlocks_IT() APIs).
      - Configure the SDMMC interrupt priorities using function HAL_NVIC_SetPriority();
      - Enable the NVIC SDMMC IRQs using function HAL_NVIC_EnableIRQ()
      - SDMMC interrupts are managed using the macros __HAL_SD_ENABLE_IT() and __HAL_SD_DISABLE_IT() inside the communication process.
      - SDMMC interrupts pending bits are managed using the macros __HAL_SD_GET_IT() and __HAL_SD_CLEAR_IT()
   d. No general propose DMA Configuration is needed, an Internal DMA for SDMMC Peripheral are used.
2. At this stage, you can perform SD read/write/erase operations after SD card initialization

SD Card Initialization and configuration

To initialize the SD Card, use the HAL_SD_Init() function. It Initializes SDMMC Peripheral(STM32 side) and the SD Card, and put it into StandBy State (Ready for data transfer). This function provide the following operations:

1. Apply the SD Card initialization process at 400KHz and check the SD Card type (Standard Capacity or High Capacity). You can change or adapt this frequency by adjusting the "ClockDiv" field. The SD Card frequency (SDMMC_CK) is computed as follows: SDMMC_CK = SDMMCCLK / (2 * ClockDiv) In initialization mode and according to the SD Card standard, make sure that the SDMMC_CK frequency doesn't exceed 400KHz. This phase of initialization is done through SDMMC_Init() and SDMMC_PowerState_ON() SDMMC low level APIs.
2. Initialize the SD card. The API used is HAL_SD_InitCard(). This phase allows the card initialization and identification and check the SD Card type (Standard Capacity or High Capacity) The initialization flow is compatible with SD standard. This API (HAL_SD_InitCard()) could be used also to reinitialize the card in case of plug-off plug-in.
3. Configure the SD Card Data transfer frequency. You can change or adapt this frequency by adjusting the "ClockDiv" field. In transfer mode and according to the SD Card standard, make sure that the SDMMC_CK frequency doesn't exceed 25MHz and 100MHz in High-speed mode switch.
4. Select the corresponding SD Card according to the address read with the step 2.
5. Configure the SD Card in wide bus mode: 4-bits data.

SD Card Read operation

- You can read from SD card in polling mode by using function HAL_SD_ReadBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_SD_GetCardState() function for SD card state.
- You can read from SD card in DMA mode by using function HAL_SD_ReadBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_SD_GetCardState() function for SD card state. You could also check the DMA transfer process through the SD Rx interrupt event.
- You can read from SD card in Interrupt mode by using function HAL_SD_ReadBlocks_IT(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_SD_GetCardState() function for SD card state. You could also check the IT transfer process through the SD Rx interrupt event.

SD Card Write operation

- You can write to SD card in polling mode by using function HAL_SD_WriteBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_SD_GetCardState() function for SD card state.
- You can write to SD card in DMA mode by using function HAL_SD_WriteBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_SD_GetCardState() function for SD card state. You could also check the DMA transfer process through the SD Tx interrupt event.
- You can write to SD card in Interrupt mode by using function HAL_SD_WriteBlocks_IT(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_SD_GetCardState() function for SD card state. You could also check the IT transfer process through the SD Tx interrupt event.

SD card status

- The SD Status contains status bits that are related to the SD Memory Card proprietary features. To get SD card status use the HAL_SD_GetCardStatus().

SD card information

- To get SD card information, you can use the function HAL_SD_GetCardInfo(). It returns useful information about the SD card such as block size, card type, block number ...

SD card CSD register

SD card CID register

SD HAL driver macros list

Note: You can refer to the SD HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_SD_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_SD_RegisterCallback() to register a user callback, it allows to register following callbacks:

- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMADblBuf0CpltCallback : callback when the DMA reception of first buffer is completed.
- Read_DMADblBuf1CpltCallback : callback when the DMA reception of second buffer is completed.
- Write_DMADblBuf0CpltCallback : callback when the DMA transmission of first buffer is completed.
- Write_DMADblBuf1CpltCallback : callback when the DMA transmission of second buffer is completed.
- MspInitCallback : SD MspInit.
- MspDeInitCallback : SD MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. For specific callbacks TransceiverCallback use dedicated register callbacks: respectively HAL_SD_RegisterTransceiverCallback(). Use function HAL_SD_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMALnkLstBufCpltCallback : callback when the DMA reception of linked list node buffer is completed.
- Write_DMALnkLstBufCpltCallback : callback when the DMA transmission of linked list node buffer is completed.
- MspInitCallback : SD MspInit.

- MspDeInitCallback : SD MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. For specific callbacks TransceiverCallback use dedicated unregister callbacks: respectively HAL_SD_UnRegisterTransceiverCallback(). By default, after the HAL_SD_Init and if the state is HAL_SD_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_SD_Init and HAL_SD_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_SD_Init and HAL_SD_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/ unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/ unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_SD_RegisterCallback before calling HAL_SD_DeInit or HAL_SD_Init function. When The compilation define USE_HAL_SD_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

67.2.2 Detailed description of functions

HAL_SD_Init

Function name

HAL_StatusTypeDef HAL_SD_Init (SD_HandleTypeDef * hsd)

Function description

HAL_SD_InitCard

Function name

HAL_StatusTypeDef HAL_SD_InitCard (SD_HandleTypeDef * hsd)

Function description

HAL_SD_DeInit

Function name

HAL_StatusTypeDef HAL_SD_DeInit (SD_HandleTypeDef * hsd)

67.3 SD Firmware driver defines

The following section lists the various define and macros of the module.

67.3.1 SD

SD

SD Error status enumeration Structure definition

HAL_SD_ERROR_NONE

No error

HAL_SD_ERROR_CMD_CRC_FAIL

Command response received (but CRC check failed)

HAL_SD_ERROR_DATA_CRC_FAIL

Data block sent/received (CRC check failed)

HAL_SD_ERROR_CMD_RSP_TIMEOUT

Command response timeout

HAL_SD_ERROR_DATA_TIMEOUT

Data timeout

HAL_SD_ERROR_TX_UNDERRUN

Transmit FIFO underrun

HAL_SD_ERROR_RX_OVERRUN

Receive FIFO overrun

HAL_SD_ERROR_ADDR_MISALIGNED

Misaligned address

HAL_SD_ERROR_BLOCK_LEN_ERR

Transferred block length is not allowed for the card or the number of transferred bytes does not match the block length

HAL_SD_ERROR_ERASE_SEQ_ERR

An error in the sequence of erase command occurs

HAL_SD_ERROR_BAD_ERASE_PARAM

An invalid selection for erase groups

HAL_SD_ERROR_WRITE_PROT_VIOLATION

Attempt to program a write protect block

HAL_SD_ERROR_LOCK_UNLOCK_FAILED

Sequence or password error has been detected in unlock command or if there was an attempt to access a locked card

HAL_SD_ERROR_COM_CRC_FAILED

CRC check of the previous command failed

HAL_SD_ERROR_ILLEGAL_CMD

Command is not legal for the card state

HAL_SD_ERROR_CARD_ECC_FAILED

Card internal ECC was applied but failed to correct the data

HAL_SD_ERROR_CC_ERR

Internal card controller error

HAL_SD_ERROR_GENERAL_UNKNOWN_ERR

General or unknown error

HAL_SD_ERROR_STREAM_READ_UNDERRUN

The card could not sustain data reading in stream rmode

HAL_SD_ERROR_STREAM_WRITE_OVERRUN

The card could not sustain data programming in stream mode

HAL_SD_ERROR_CID_CSD_OVERWRITE

CID/CSD overwrite error

HAL_SD_ERROR_WP_ERASE_SKIP

Only partial address space was erased

HAL_SD_ERROR_CARD_ECC_DISABLED

Command has been executed without using internal ECC

HAL_SD_ERROR_ERASE_RESET

Erase sequence was cleared before executing because an out of erase sequence command was received

HAL_SD_ERROR_AKE_SEQ_ERR

Error in sequence of authentication

HAL_SD_ERROR_INVALID_VOLTRANGE

Error in case of invalid voltage range

HAL_SD_ERROR_ADDR_OUT_OF_RANGE

Error when addressed block is out of range

HAL_SD_ERROR_REQUEST_NOT_APPLICABLE

Error when command request is not applicable

HAL_SD_ERROR_PARAM

the used parameter is not valid

HAL_SD_ERROR_UNSUPPORTED_FEATURE

Error when feature is not insupported

HAL_SD_ERROR_BUSY

Error when transfer process is busy

HAL_SD_ERROR_DMA

Error while DMA transfer

HAL_SD_ERROR_TIMEOUT

Timeout error

HAL_SD_ERROR_INVALID_CALLBACK

Invalid callback error

SD context enumeration

SD_CONTEXT_NONE

None

SD_CONTEXT_READ_SINGLE_BLOCK

Read single block operation

SD_CONTEXT_READ_MULTIPLE_BLOCK

Read multiple blocks operation

SD_CONTEXT_WRITE_SINGLE_BLOCK

Write single block operation

SD_CONTEXT_WRITE_MULTIPLE_BLOCK

Write multiple blocks operation

SD_CONTEXT_IT

Process in Interrupt mode

SD_CONTEXT_DMA

Process in DMA mode

SD Supported Memory Cards

CARD_NORMAL_SPEED

Normal Speed Card <12.5Mo/s , Spec Version 1.01

CARD_HIGH_SPEED

High Speed Card <25Mo/s , Spec version 2.00

CARD_ULTRA_HIGH_SPEED

UHS-I SD Card <50Mo/s for SDR50, DDR5 Cards and <104Mo/s for SDR104, Spec version 3.01

CARD_SDSC

SD Standard Capacity <2Go

CARD_SDHC_SDXC

SD High Capacity <32Go, SD Extended Capacity <2To

CARD_SECURED

SD Supported Version

CARD_V1_X

CARD_V2_X

SD Exported Constants

BLOCKSIZE

Block size is 512 bytes

SD Exported Macros

__HAL_SD_RESET_HANDLE_STATE

Description:

- Reset SD handle state.

Parameters:

- __HANDLE__: SD Handle.

Return value:

- None

__HAL_SD_ENABLE_IT

Description:

- Enable the SD device interrupt.

Parameters:

- __HANDLE__: SD Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be enabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SDIO interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_SD_DISABLE_IT

Description:

- Disable the SD device interrupt.

Parameters:

- __HANDLE__: SD Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be disabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SDIO interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_SD_GET_FLAG

Description:

- Check whether the specified SD flag is set or not.

Parameters:

- __HANDLE__: SD Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_DPSMACT: Data path state machine active
  - SDMMC_FLAG_CPSMACT: Command path state machine active
  - SDMMC_FLAG_TXFIFOHE: Transmit FIFO Half Empty
  - SDMMC_FLAG_RXFIFOHF: Receive FIFO Half Full
  - SDMMC_FLAG_TXFIFOF: Transmit FIFO full
  - SDMMC_FLAG_RXFIFOF: Receive FIFO full
  - SDMMC_FLAG_TXFIFOE: Transmit FIFO empty
  - SDMMC_FLAG_RXFIFOE: Receive FIFO empty
  - SDMMC_FLAG_BUSYD0: Inverted value of SDMMC_D0 line (Busy)
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SDIO interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- The: new state of SD FLAG (SET or RESET).

__HAL_SD_CLEAR_FLAG

Description:

- Clear the SD's pending flags.

Parameters:

- __HANDLE__: SD Handle.
- __FLAG__: specifies the flag to clear. This parameter can be one or a combination of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SDIO interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- None

__HAL_SD_GET_IT

Description:

- Check whether the specified SD interrupt has occurred or not.

Parameters:

- __HANDLE__: SD Handle.
- __INTERRUPT__: specifies the SDMMC interrupt source to check. This parameter can be one of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SDIO interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- The: new state of SD IT (SET or RESET).

__HAL_SD_CLEAR_IT

Description:

- Clear the SD's interrupt pending bits.

Parameters:

- __HANDLE__: SD Handle.
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SDIO interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

SD Card State enumeration structure

HAL_SD_CARD_READY

Card state is ready

HAL_SD_CARD_IDENTIFICATION

Card is in identification state

HAL_SD_CARD_STANDBY

Card is in standby state

HAL_SD_CARD_TRANSFER

Card is in transfer state

HAL_SD_CARD_SENDING

Card is sending an operation

HAL_SD_CARD_RECEIVING

Card is receiving operation information

HAL_SD_CARD_PROGRAMMING

Card is in programming state

HAL_SD_CARD_DISCONNECTED

Card is disconnected

HAL_SD_CARD_ERROR

Card response Error

68 HAL SD Extension Driver

68.1 SDEx Firmware driver API description

The following section lists the various functions of the SDEx library.

68.1.1 How to use this driver

The SD Extension HAL driver can be used as follows:

- Configure Buffer0 and Buffer1 start address and Buffer size using HAL_SDEx_ConfigDMAMultiBuffer() function.
- Start Read and Write for multibuffer mode using HAL_SDEx_ReadBlocksDMAMultiBuffer() and HAL_SDEx_WriteBlocksDMAMultiBuffer() functions.

68.1.2 Detailed description of functions

HAL_SDEx_DMALinkedList_ReadBlocks

Function name

HAL_StatusTypeDef HAL_SDEx_DMALinkedList_ReadBlocks (SD_HandleTypeDef * hsd, const SD_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_SDEx_DMALinkedList_WriteBlocks

Function name

HAL_StatusTypeDef HAL_SDEx_DMALinkedList_WriteBlocks (SD_HandleTypeDef * hsd, const SD_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_SDEx_DMALinkedList_BuildNode

Function name

69 HAL SMARTCARD Generic Driver

69.1 SMARTCARD Firmware driver registers structures

69.1.1 SMARTCARD_InitTypeDef

SMARTCARD_InitTypeDef is defined in the stm32n6xx_hal_smartcard.h

Data Fields

- ***uint32_t BaudRate***
- ***uint32_t WordLength***
- ***uint32_t StopBits***
- ***uint16_t Parity***
- ***uint16_t Mode***
- ***uint16_t CLKPolarity***
- ***uint16_t CLKPhase***
- ***uint16_t CLKLastBit***
- ***uint16_t OneBitSampling***
- ***uint8_t Prescaler***
- ***uint8_t GuardTime***
- ***uint16_t NACKEnable***
- ***uint32_t TimeOutEnable***
- ***uint32_t TimeOutValue***
- ***uint8_t BlockLength***
- ***uint8_t AutoRetryCount***
- ***uint32_t ClockPrescaler***

Field Documentation

- ***uint32_t SMARTCARD_InitTypeDef::BaudRate***
  Configures the SmartCard communication baud rate. The baud rate register is computed using the following formula: Baud Rate Register = ((usart_ker_ckpres) / ((hsmartcard->Init.BaudRate))) where usart_ker_ckpres is the USART input clock divided by a prescaler
- ***uint32_t SMARTCARD_InitTypeDef::WordLength***
  Specifies the number of data bits transmitted or received in a frame. This parameter ***SMARTCARD_Word_Length*** can only be set to 9 (8 data + 1 parity bits).
- ***uint32_t SMARTCARD_InitTypeDef::StopBits***
  Specifies the number of stop bits. This parameter can be a value of ***SMARTCARD_Stop_Bits***.
- ***uint16_t SMARTCARD_InitTypeDef::Parity***
  Specifies the parity mode. This parameter can be a value of ***SMARTCARD_Parity***
  Note:
  – The parity is enabled by default (PCE is forced to 1). Since the WordLength is forced to 8 bits + parity, M is forced to 1 and the parity bit is the 9th bit.
- ***uint16_t SMARTCARD_InitTypeDef::Mode***
  Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of ***SMARTCARD_Mode***
- ***uint16_t SMARTCARD_InitTypeDef::CLKPolarity***
  Specifies the steady state of the serial clock. This parameter can be a value of ***SMARTCARD_Clock_Polarity***
- ***uint16_t SMARTCARD_InitTypeDef::CLKPhase***
  Specifies the clock transition on which the bit capture is made. This parameter can be a value of ***SMARTCARD_Clock_Phase***
- ***uint16_t SMARTCARD_InitTypeDef::CLKLastBit***
  Specifies whether the clock pulse corresponding to the last transmitted data bit (MSB) has to be output on the SCLK pin in synchronous mode. This parameter can be a value of ***SMARTCARD_Last_Bit***

- ***uint16_t SMARTCARD_InitTypeDef::OneBitSampling***
  Specifies whether a single sample or three samples' majority vote is selected. Selecting the single sample method increases the receiver tolerance to clock deviations. This parameter can be a value of ***SMARTCARD_OneBit_Sampling***.
- ***uint8_t SMARTCARD_InitTypeDef::Prescaler***
  Specifies the SmartCard Prescaler. This parameter can be any value from 0x01 to 0x1F. Prescaler value is multiplied by 2 to give the division factor of the source clock frequency
- ***uint8_t SMARTCARD_InitTypeDef::GuardTime***
  Specifies the SmartCard Guard Time applied after stop bits.
- ***uint16_t SMARTCARD_InitTypeDef::NACKEnable***
  Specifies whether the SmartCard NACK transmission is enabled in case of parity error. This parameter can be a value of ***SMARTCARD_NACK_Enable***
- ***uint32_t SMARTCARD_InitTypeDef::TimeOutEnable***
  Specifies whether the receiver timeout is enabled. This parameter can be a value of ***SMARTCARD_Timeout_Enable***
- ***uint32_t SMARTCARD_InitTypeDef::TimeOutValue***
  Specifies the receiver time out value in number of baud blocks: it is used to implement the Character Wait Time (CWT) and Block Wait Time (BWT). It is coded over 24 bits.
- ***uint8_t SMARTCARD_InitTypeDef::BlockLength***
  Specifies the SmartCard Block Length in T=1 Reception mode. This parameter can be any value from 0x0 to 0xFF
- ***uint8_t SMARTCARD_InitTypeDef::AutoRetryCount***
  Specifies the SmartCard auto-retry count (number of retries in receive and transmit mode). When set to 0, retransmission is disabled. Otherwise, its maximum value is 7 (before signalling an error)
- ***uint32_t SMARTCARD_InitTypeDef::ClockPrescaler***
  Specifies the prescaler value used to divide the USART clock source. This parameter can be a value of ***SMARTCARD_ClockPrescaler***.

69.1.2 SMARTCARD_AdvFeatureInitTypeDef

SMARTCARD_AdvFeatureInitTypeDef is defined in the stm32n6xx_hal_smartcard.h

Data Fields

- ***uint32_t AdvFeatureInit***
- ***uint32_t TxPinLevelInvert***
- ***uint32_t RxPinLevelInvert***
- ***uint32_t DataInvert***
- ***uint32_t Swap***
- ***uint32_t OverrunDisable***
- ***uint32_t DMADisableonRxError***
- ***uint32_t MSBFirst***
- ***uint16_t TxCompletionIndication***

Field Documentation

- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::AdvFeatureInit***
  Specifies which advanced SMARTCARD features is initialized. Several advanced features may be initialized at the same time. This parameter can be a value of ***SMARTCARDEx_Advanced_Features_Initialization_Type***
- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::TxPinLevelInvert***
  Specifies whether the TX pin active level is inverted. This parameter can be a value of ***SMARTCARD_Tx_Inv***
- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::RxPinLevelInvert***
  Specifies whether the RX pin active level is inverted. This parameter can be a value of ***SMARTCARD_Rx_Inv***
- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::DataInvert***
  Specifies whether data are inverted (positive/direct logic vs negative/inverted logic). This parameter can be a value of ***SMARTCARD_Data_Inv***

- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::Swap***
  Specifies whether TX and RX pins are swapped. This parameter can be a value of ***SMARTCARD_Rx_Tx_Swap***
- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::OverrunDisable***
  Specifies whether the reception overrun detection is disabled. This parameter can be a value of ***SMARTCARD_Overrun_Disable***
- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::DMADisableonRxError***
  Specifies whether the DMA is disabled in case of reception error. This parameter can be a value of ***SMARTCARD_DMA_Disable_on_Rx_Error***
- ***uint32_t SMARTCARD_AdvFeatureInitTypeDef::MSBFirst***
  Specifies whether MSB is sent first on UART line. This parameter can be a value of ***SMARTCARD_MSB_First***
- ***uint16_t SMARTCARD_AdvFeatureInitTypeDef::TxCompletionIndication***
  Specifies which transmission completion indication is used: before (when relevant flag is available) or once guard time period has elapsed. This parameter can be a value of ***SMARTCARDEx_Transmission_Completion_Indication***.

69.1.3 __SMARTCARD_HandleTypeDef

__SMARTCARD_HandleTypeDef is defined in the stm32n6xx_hal_smartcard.h

Data Fields

- ***USART_TypeDef * Instance***
- ***SMARTCARD_InitTypeDef Init***
- ***SMARTCARD_AdvFeatureInitTypeDef AdvancedInit***
- ***const uint8_t * pTxBuffPtr***
- ***uint16_t TxXferSize***
- ***__IO uint16_t TxXferCount***
- ***uint8_t * pRxBuffPtr***
- ***uint16_t RxXferSize***
- ***__IO uint16_t RxXferCount***
- ***uint16_t NbRxDataToProcess***
- ***uint16_t NbTxDataToProcess***
- ***uint32_t FifoMode***
- ***void(* RxISR***
- ***void(* TxISR***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_SMARTCARD_StateTypeDef gState***
- ***__IO HAL_SMARTCARD_StateTypeDef RxState***
- ***__IO uint32_t ErrorCode***
- ***void(* TxCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* AbortTransmitCpltCallback***
- ***void(* AbortReceiveCpltCallback***
- ***void(* RxFifoFullCallback***
- ***void(* TxFifoEmptyCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***USART_TypeDef* __SMARTCARD_HandleTypeDef::Instance***
  USART registers base address
- ***SMARTCARD_InitTypeDef __SMARTCARD_HandleTypeDef::Init***
  SmartCard communication parameters
- ***SMARTCARD_AdvFeatureInitTypeDef __SMARTCARD_HandleTypeDef::AdvancedInit***
  SmartCard advanced features initialization parameters
- ***const uint8_t* __SMARTCARD_HandleTypeDef::pTxBuffPtr***
  Pointer to SmartCard Tx transfer Buffer
- ***uint16_t __SMARTCARD_HandleTypeDef::TxXferSize***
  SmartCard Tx Transfer size
- ***__IO uint16_t __SMARTCARD_HandleTypeDef::TxXferCount***
  SmartCard Tx Transfer Counter
- ***uint8_t* __SMARTCARD_HandleTypeDef::pRxBuffPtr***
  Pointer to SmartCard Rx transfer Buffer
- ***uint16_t __SMARTCARD_HandleTypeDef::RxXferSize***
  SmartCard Rx Transfer size
- ***__IO uint16_t __SMARTCARD_HandleTypeDef::RxXferCount***
  SmartCard Rx Transfer Counter
- ***uint16_t __SMARTCARD_HandleTypeDef::NbRxDataToProcess***
  Number of data to process during RX ISR execution
- ***uint16_t __SMARTCARD_HandleTypeDef::NbTxDataToProcess***
  Number of data to process during TX ISR execution
- ***uint32_t __SMARTCARD_HandleTypeDef::FifoMode***
  Specifies if the FIFO mode will be used. This parameter can be a value of ***SMARTCARDEx_FIFO_mode***.
- ***void(* __SMARTCARD_HandleTypeDef::RxISR)(struct __SMARTCARD_HandleTypeDef *huart)***
  Function pointer on Rx IRQ handler
- ***void(* __SMARTCARD_HandleTypeDef::TxISR)(struct __SMARTCARD_HandleTypeDef *huart)***
  Function pointer on Tx IRQ handler
- ***DMA_HandleTypeDef* __SMARTCARD_HandleTypeDef::hdmatx***
  SmartCard Tx DMA Handle parameters
- ***DMA_HandleTypeDef* __SMARTCARD_HandleTypeDef::hdmarx***
  SmartCard Rx DMA Handle parameters
- ***HAL_LockTypeDef __SMARTCARD_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_SMARTCARD_StateTypeDef __SMARTCARD_HandleTypeDef::gState***
  SmartCard state information related to global Handle management and also related to Tx operations. This parameter can be a value of **HAL_SMARTCARD_StateTypeDef**
- ***__IO HAL_SMARTCARD_StateTypeDef __SMARTCARD_HandleTypeDef::RxState***
  SmartCard state information related to Rx operations. This parameter can be a value of **HAL_SMARTCARD_StateTypeDef**
- ***__IO uint32_t __SMARTCARD_HandleTypeDef::ErrorCode***
  SmartCard Error code
- ***void(* __SMARTCARD_HandleTypeDef::TxCpltCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Tx Complete Callback
- ***void(* __SMARTCARD_HandleTypeDef::RxCpltCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Rx Complete Callback
- ***void(* __SMARTCARD_HandleTypeDef::ErrorCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Error Callback
- ***void(* __SMARTCARD_HandleTypeDef::AbortCpltCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Abort Complete Callback

- ***void(* __SMARTCARD_HandleTypeDef::AbortTransmitCpltCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Abort Transmit Complete Callback
- ***void(* __SMARTCARD_HandleTypeDef::AbortReceiveCpltCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Abort Receive Complete Callback
- ***void(* __SMARTCARD_HandleTypeDef::RxFifoFullCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Rx Fifo Full Callback
- ***void(* __SMARTCARD_HandleTypeDef::TxFifoEmptyCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Tx Fifo Empty Callback
- ***void(* __SMARTCARD_HandleTypeDef::MspInitCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Msp Init callback
- ***void(* __SMARTCARD_HandleTypeDef::MspDeInitCallback)(struct __SMARTCARD_HandleTypeDef *hsmartcard)***
  SMARTCARD Msp DeInit callback

69.2 SMARTCARD Firmware driver API description

The following section lists the various functions of the SMARTCARD library.

69.2.1 How to use this driver

The SMARTCARD HAL driver can be used as follows:

1. Declare a SMARTCARD_HandleTypeDef handle structure (eg. SMARTCARD_HandleTypeDef hsmartcard).
2. Associate a USART to the SMARTCARD handle hsmartcard.
3. Initialize the SMARTCARD low level resources by implementing the HAL_SMARTCARD_MspInit() API:
   - Enable the USARTx interface clock.
   - USART pins configuration:
     - Enable the clock for the USART GPIOs.
     - Configure the USART pins (TX as alternate function pull-up, RX as alternate function Input).
   - NVIC configuration if you need to use interrupt process (HAL_SMARTCARD_Transmit_IT() and HAL_SMARTCARD_Receive_IT() APIs):
     - Configure the USARTx interrupt priority.
     - Enable the NVIC USART IRQ handle.
   - DMA Configuration if you need to use DMA process (HAL_SMARTCARD_Transmit_DMA() and HAL_SMARTCARD_Receive_DMA() APIs):
     - Declare a DMA handle structure for the Tx/Rx channel.
     - Enable the DMAx interface clock.
     - Configure the declared DMA handle structure with the required Tx/Rx parameters.
     - Configure the DMA Tx/Rx channel.
     - Associate the initialized DMA handle to the SMARTCARD DMA Tx/Rx handle.
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
4. Program the Baud Rate, Parity, Mode(Receiver/Transmitter), clock enabling/disabling and accordingly, the clock parameters (parity, phase, last bit), prescaler value, guard time and NACK on transmission error enabling or disabling in the hsmartcard handle Init structure.
5. If required, program SMARTCARD advanced features (TX/RX pins swap, TimeOut, auto-retry counter,...) in the hsmartcard handle AdvancedInit structure.
6. Initialize the SMARTCARD registers by calling the HAL_SMARTCARD_Init() API:
   - This API configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL_SMARTCARD_MspInit() API.

Note: The specific SMARTCARD interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_SMARTCARD_ENABLE_IT() and __HAL_SMARTCARD_DISABLE_IT() inside the transmit and receive process.

Three operation modes are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_SMARTCARD_Transmit()
- Receive an amount of data in blocking mode using HAL_SMARTCARD_Receive()

Interrupt mode IO operation

- Send an amount of data in non-blocking mode using HAL_SMARTCARD_Transmit_IT()
- At transmission end of transfer HAL_SMARTCARD_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SMARTCARD_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL_SMARTCARD_Receive_IT()
- At reception end of transfer HAL_SMARTCARD_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SMARTCARD_RxCpltCallback()
- In case of transfer Error, HAL_SMARTCARD_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SMARTCARD_ErrorCallback()

DMA mode IO operation

- Send an amount of data in non-blocking mode (DMA) using HAL_SMARTCARD_Transmit_DMA()
- At transmission end of transfer HAL_SMARTCARD_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SMARTCARD_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL_SMARTCARD_Receive_DMA()
- At reception end of transfer HAL_SMARTCARD_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_SMARTCARD_RxCpltCallback()
- In case of transfer Error, HAL_SMARTCARD_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SMARTCARD_ErrorCallback()

SMARTCARD HAL driver macros list

Below the list of most used macros in SMARTCARD HAL driver.

- __HAL_SMARTCARD_GET_FLAG : Check whether or not the specified SMARTCARD flag is set
- __HAL_SMARTCARD_CLEAR_FLAG : Clear the specified SMARTCARD pending flag
- __HAL_SMARTCARD_ENABLE_IT: Enable the specified SMARTCARD interrupt
- __HAL_SMARTCARD_DISABLE_IT: Disable the specified SMARTCARD interrupt
- __HAL_SMARTCARD_GET_IT_SOURCE: Check whether or not the specified SMARTCARD interrupt is enabled

Note: You can refer to the SMARTCARD HAL driver header file for more useful macros

69.2.2 Callback registration

The compilation define USE_HAL_SMARTCARD_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_SMARTCARD_RegisterCallback() to register a user callback. Function HAL_SMARTCARD_RegisterCallback() allows to register following callbacks:

- TxCpltCallback : Tx Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- RxFifoFullCallback : Rx Fifo Full Callback.

- TxFifoEmptyCallback : Tx Fifo Empty Callback.
- MspInitCallback : SMARTCARD MspInit.
- MspDeInitCallback : SMARTCARD MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_SMARTCARD_UnRegisterCallback() to reset a callback to the default weak function. HAL_SMARTCARD_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TxCpltCallback : Tx Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- RxFifoFullCallback : Rx Fifo Full Callback.
- TxFifoEmptyCallback : Tx Fifo Empty Callback.
- MspInitCallback : SMARTCARD MspInit.
- MspDeInitCallback : SMARTCARD MspDeInit.

By default, after the HAL_SMARTCARD_Init() and when the state is HAL_SMARTCARD_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_SMARTCARD_TxCpltCallback(), HAL_SMARTCARD_RxCpltCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak functions in the HAL_SMARTCARD_Init() and HAL_SMARTCARD_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_SMARTCARD_Init() and HAL_SMARTCARD_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_SMARTCARD_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_SMARTCARD_STATE_READY or HAL_SMARTCARD_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_SMARTCARD_RegisterCallback() before calling HAL_SMARTCARD_DeInit() or HAL_SMARTCARD_Init() function.

When The compilation define USE_HAL_SMARTCARD_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak callbacks are used.

69.2.3 Detailed description of functions

HAL_SMARTCARD_Init

Function name

HAL_StatusTypeDef HAL_SMARTCARD_Init (SMARTCARD_HandleTypeDef * hsmartcard)

HAL_SMARTCARD_GetError

Function name

uint32_t HAL_SMARTCARD_GetError (const SMARTCARD_HandleTypeDef * hsmartcard)

Function description

69.3 SMARTCARD Firmware driver defines

The following section lists the various define and macros of the module.

69.3.1 SMARTCARD

SMARTCARD

SMARTCARD Clock Prescaler

SMARTCARD_PRESCALER_DIV1

fclk_pres = fclk

SMARTCARD_PRESCALER_DIV2

fclk_pres = fclk/2

SMARTCARD_PRESCALER_DIV4

fclk_pres = fclk/4

SMARTCARD_PRESCALER_DIV6

fclk_pres = fclk/6

SMARTCARD_PRESCALER_DIV8

fclk_pres = fclk/8

SMARTCARD_PRESCALER_DIV10

fclk_pres = fclk/10

SMARTCARD_PRESCALER_DIV12

fclk_pres = fclk/12

SMARTCARD_PRESCALER_DIV16

fclk_pres = fclk/16

SMARTCARD_PRESCALER_DIV32

fclk_pres = fclk/32

SMARTCARD_PRESCALER_DIV64

fclk_pres = fclk/64

SMARTCARD_PRESCALER_DIV128

fclk_pres = fclk/128

SMARTCARD_PRESCALER_DIV256

fclk_pres = fclk/256

SMARTCARD Clock Phase

SMARTCARD_PHASE_1EDGE

SMARTCARD frame phase on first clock transition

SMARTCARD_PHASE_2EDGE

SMARTCARD frame phase on second clock transition

SMARTCARD Clock Polarity

SMARTCARD_POLARITY_LOW

SMARTCARD frame low polarity

SMARTCARD_POLARITY_HIGH

SMARTCARD frame high polarity

SMARTCARD advanced feature Binary Data inversion

SMARTCARD_ADVFEATURE_DATAINV_DISABLE

Binary data inversion disable

SMARTCARD_ADVFEATURE_DATAINV_ENABLE

Binary data inversion enable

SMARTCARD advanced feature DMA Disable on Rx Error

SMARTCARD_ADVFEATURE_DMA_ENABLEONRXERROR

DMA enable on Reception Error

SMARTCARD_ADVFEATURE_DMA_DISABLEONRXERROR

DMA disable on Reception Error

SMARTCARD Error Code Definition

HAL_SMARTCARD_ERROR_NONE

No error

HAL_SMARTCARD_ERROR_PE

Parity error

HAL_SMARTCARD_ERROR_NE

Noise error

HAL_SMARTCARD_ERROR_FE

frame error

HAL_SMARTCARD_ERROR_ORE

Overrun error

HAL_SMARTCARD_ERROR_DMA

DMA transfer error

HAL_SMARTCARD_ERROR_RTO

Receiver TimeOut error

HAL_SMARTCARD_ERROR_INVALID_CALLBACK

Invalid Callback error

SMARTCARD Exported Macros

__HAL_SMARTCARD_RESET_HANDLE_STATE

Description:

- Reset SMARTCARD handle states.

Parameters:

- __HANDLE__: SMARTCARD handle.

Return value:

- None

__HAL_SMARTCARD_FLUSH_DRREGISTER

Description:

- Flush the Smartcard Data registers.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_CLEAR_FLAG

Description:

- Clear the specified SMARTCARD pending flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - SMARTCARD_CLEAR_PEF Parity error clear flag
  - SMARTCARD_CLEAR_FEF Framing error clear flag
  - SMARTCARD_CLEAR_NEF Noise detected clear flag
  - SMARTCARD_CLEAR_OREF OverRun error clear flag
  - SMARTCARD_CLEAR_IDLEF Idle line detected clear flag
  - SMARTCARD_CLEAR_TCF Transmission complete clear flag
  - SMARTCARD_CLEAR_TCBGTF Transmission complete before guard time clear flag
  - SMARTCARD_CLEAR_RTOF Receiver timeout clear flag
  - SMARTCARD_CLEAR_EOBF End of block clear flag
  - SMARTCARD_CLEAR_TXFECF TXFIFO empty Clear flag

Return value:

- None

__HAL_SMARTCARD_CLEAR_PEFLAG

Description:

- Clear the SMARTCARD PE pending flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_CLEAR_FEFLAG

Description:

- Clear the SMARTCARD FE pending flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_CLEAR_NEFLAG

Description:

- Clear the SMARTCARD NE pending flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_CLEAR_OREFLAG

Description:

- Clear the SMARTCARD ORE pending flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_CLEAR_IDLEFLAG

Description:

- Clear the SMARTCARD IDLE pending flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_GET_FLAG

Description:

- Check whether the specified Smartcard flag is set or not.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SMARTCARD_FLAG_TCBGT Transmission complete before guard time flag (when flag available)
  - SMARTCARD_FLAG_REACK Receive enable acknowledge flag
  - SMARTCARD_FLAG_TEACK Transmit enable acknowledge flag
  - SMARTCARD_FLAG_BUSY Busy flag
  - SMARTCARD_FLAG_EOBF End of block flag
  - SMARTCARD_FLAG_RTOF Receiver timeout flag
  - SMARTCARD_FLAG_TXE Transmit data register empty flag
  - SMARTCARD_FLAG_TC Transmission complete flag
  - SMARTCARD_FLAG_RXNE Receive data register not empty flag
  - SMARTCARD_FLAG_IDLE Idle line detection flag
  - SMARTCARD_FLAG_ORE Overrun error flag
  - SMARTCARD_FLAG_NE Noise error flag
  - SMARTCARD_FLAG_FE Framing error flag
  - SMARTCARD_FLAG_PE Parity error flag
  - SMARTCARD_FLAG_TXFNF TXFIFO not full flag
  - SMARTCARD_FLAG_RXFNE RXFIFO not empty flag
  - SMARTCARD_FLAG_TXFE TXFIFO Empty flag
  - SMARTCARD_FLAG_RXFF RXFIFO Full flag
  - SMARTCARD_FLAG_RXFT SMARTCARD RXFIFO threshold flag
  - SMARTCARD_FLAG_TXFT SMARTCARD TXFIFO threshold flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_SMARTCARD_ENABLE_IT

Description:

- Enable the specified SmartCard interrupt.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __INTERRUPT__: specifies the SMARTCARD interrupt to enable. This parameter can be one of the following values:
  - SMARTCARD_IT_EOB End of block interrupt
  - SMARTCARD_IT_RTO Receive timeout interrupt
  - SMARTCARD_IT_TXE Transmit data register empty interrupt
  - SMARTCARD_IT_TC Transmission complete interrupt
  - SMARTCARD_IT_TCBGT Transmission complete before guard time interrupt (when interruption available)
  - SMARTCARD_IT_RXNE Receive data register not empty interrupt
  - SMARTCARD_IT_IDLE Idle line detection interrupt
  - SMARTCARD_IT_PE Parity error interrupt
  - SMARTCARD_IT_ERR Error interrupt(frame error, noise error, overrun error)
  - SMARTCARD_IT_TXFNF TX FIFO not full interruption
  - SMARTCARD_IT_RXFNE RXFIFO not empty interruption
  - SMARTCARD_IT_RXFF RXFIFO full interruption
  - SMARTCARD_IT_TXFE TXFIFO empty interruption
  - SMARTCARD_IT_RXFT RXFIFO threshold reached interruption
  - SMARTCARD_IT_TXFT TXFIFO threshold reached interruption

Return value:

- None

__HAL_SMARTCARD_DISABLE_IT

Description:

- Disable the specified SmartCard interrupt.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __INTERRUPT__: specifies the SMARTCARD interrupt to disable. This parameter can be one of the following values:
  - SMARTCARD_IT_EOB End of block interrupt
  - SMARTCARD_IT_RTO Receive timeout interrupt
  - SMARTCARD_IT_TXE Transmit data register empty interrupt
  - SMARTCARD_IT_TC Transmission complete interrupt
  - SMARTCARD_IT_TCBGT Transmission complete before guard time interrupt (when interruption available)
  - SMARTCARD_IT_RXNE Receive data register not empty interrupt
  - SMARTCARD_IT_IDLE Idle line detection interrupt
  - SMARTCARD_IT_PE Parity error interrupt
  - SMARTCARD_IT_ERR Error interrupt(frame error, noise error, overrun error)
  - SMARTCARD_IT_TXFNF TX FIFO not full interruption
  - SMARTCARD_IT_RXFNE RXFIFO not empty interruption
  - SMARTCARD_IT_RXFF RXFIFO full interruption
  - SMARTCARD_IT_TXFE TXFIFO empty interruption
  - SMARTCARD_IT_RXFT RXFIFO threshold reached interruption
  - SMARTCARD_IT_TXFT TXFIFO threshold reached interruption

Return value:

- None

__HAL_SMARTCARD_GET_IT

Description:

- Check whether the specified SmartCard interrupt has occurred or not.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __INTERRUPT__: specifies the SMARTCARD interrupt to check. This parameter can be one of the following values:
  - SMARTCARD_IT_EOB End of block interrupt
  - SMARTCARD_IT_RTO Receive timeout interrupt
  - SMARTCARD_IT_TXE Transmit data register empty interrupt
  - SMARTCARD_IT_TC Transmission complete interrupt
  - SMARTCARD_IT_TCBGT Transmission complete before guard time interrupt (when interruption available)
  - SMARTCARD_IT_RXNE Receive data register not empty interrupt
  - SMARTCARD_IT_IDLE Idle line detection interrupt
  - SMARTCARD_IT_PE Parity error interrupt
  - SMARTCARD_IT_ERR Error interrupt(frame error, noise error, overrun error)
  - SMARTCARD_IT_TXFNF TX FIFO not full interruption
  - SMARTCARD_IT_RXFNE RXFIFO not empty interruption
  - SMARTCARD_IT_RXFF RXFIFO full interruption
  - SMARTCARD_IT_TXFE TXFIFO empty interruption
  - SMARTCARD_IT_RXFT RXFIFO threshold reached interruption
  - SMARTCARD_IT_TXFT TXFIFO threshold reached interruption

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

__HAL_SMARTCARD_GET_IT_SOURCE

Description:

- Check whether the specified SmartCard interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __INTERRUPT__: specifies the SMARTCARD interrupt source to check. This parameter can be one of the following values:
  - SMARTCARD_IT_EOB End of block interrupt
  - SMARTCARD_IT_RTO Receive timeout interrupt
  - SMARTCARD_IT_TXE Transmit data register empty interrupt
  - SMARTCARD_IT_TC Transmission complete interrupt
  - SMARTCARD_IT_TCBGT Transmission complete before guard time interrupt (when interruption available)
  - SMARTCARD_IT_RXNE Receive data register not empty interrupt
  - SMARTCARD_IT_IDLE Idle line detection interrupt
  - SMARTCARD_IT_PE Parity error interrupt
  - SMARTCARD_IT_ERR Error interrupt(frame error, noise error, overrun error)
  - SMARTCARD_IT_TXFNF TX FIFO not full interruption
  - SMARTCARD_IT_RXFNE RXFIFO not empty interruption
  - SMARTCARD_IT_RXFF RXFIFO full interruption
  - SMARTCARD_IT_TXFE TXFIFO empty interruption
  - SMARTCARD_IT_RXFT RXFIFO threshold reached interruption
  - SMARTCARD_IT_TXFT TXFIFO threshold reached interruption

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

__HAL_SMARTCARD_CLEAR_IT

Description:

- Clear the specified SMARTCARD ISR flag, in setting the proper ICR register flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __IT_CLEAR__: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt. This parameter can be one of the following values:
  - SMARTCARD_CLEAR_PEF Parity error clear flag
  - SMARTCARD_CLEAR_FEF Framing error clear flag
  - SMARTCARD_CLEAR_NEF Noise detected clear flag
  - SMARTCARD_CLEAR_OREF OverRun error clear flag
  - SMARTCARD_CLEAR_IDLEF Idle line detection clear flag
  - SMARTCARD_CLEAR_TXFECF TXFIFO empty Clear Flag
  - SMARTCARD_CLEAR_TCF Transmission complete clear flag
  - SMARTCARD_CLEAR_TCBGTF Transmission complete before guard time clear flag (when flag available)
  - SMARTCARD_CLEAR_RTOF Receiver timeout clear flag
  - SMARTCARD_CLEAR_EOBF End of block clear flag

Return value:

- None

__HAL_SMARTCARD_SEND_REQ

Description:

- Set a specific SMARTCARD request flag.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.
- __REQ__: specifies the request flag to set This parameter can be one of the following values:
  - SMARTCARD_RXDATA_FLUSH_REQUEST Receive data flush Request
  - SMARTCARD_TXDATA_FLUSH_REQUEST Transmit data flush Request

Return value:

- None

__HAL_SMARTCARD_ONE_BIT_SAMPLE_ENABLE

Description:

- Enable the SMARTCARD one bit sample method.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_ONE_BIT_SAMPLE_DISABLE

Description:

- Disable the SMARTCARD one bit sample method.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_ENABLE

Description:

- Enable the USART associated to the SMARTCARD Handle.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

__HAL_SMARTCARD_DISABLE

Description:

- Disable the USART associated to the SMARTCARD Handle.

Parameters:

- __HANDLE__: specifies the SMARTCARD Handle.

Return value:

- None

SMARTCARD interruptions flags mask

SMARTCARD_IT_MASK

SMARTCARD interruptions flags mask

SMARTCARD_CR_MASK

SMARTCARD control register mask

SMARTCARD_CR_POS

SMARTCARD control register position

SMARTCARD_ISR_MASK

SMARTCARD ISR register mask

SMARTCARD_ISR_POS

SMARTCARD ISR register position

SMARTCARD Last Bit

SMARTCARD_LASTBIT_DISABLE

SMARTCARD frame last data bit clock pulse not output to SCLK pin

SMARTCARD_LASTBIT_ENABLE

SMARTCARD frame last data bit clock pulse output to SCLK pin

SMARTCARD Transfer Mode

SMARTCARD_MODE_RX

SMARTCARD RX mode

SMARTCARD_MODE_TX

SMARTCARD TX mode

SMARTCARD_MODE_TX_RX

SMARTCARD RX and TX mode

SMARTCARD advanced feature MSB first

SMARTCARD_ADVFEATURE_MSBFIRST_DISABLE

Most significant bit sent/received first disable

SMARTCARD_ADVFEATURE_MSBFIRST_ENABLE

Most significant bit sent/received first enable

SMARTCARD NACK Enable

SMARTCARD_NACK_DISABLE

SMARTCARD NACK transmission disabled

SMARTCARD_NACK_ENABLE

SMARTCARD NACK transmission enabled

SMARTCARD One Bit Sampling Method

SMARTCARD_ONE_BIT_SAMPLE_DISABLE

SMARTCARD frame one-bit sample disabled

SMARTCARD_ONE_BIT_SAMPLE_ENABLE

SMARTCARD frame one-bit sample enabled

SMARTCARD advanced feature Overrun Disable

SMARTCARD_ADVFEATURE_OVERRUN_ENABLE

RX overrun enable

SMARTCARD_ADVFEATURE_OVERRUN_DISABLE

RX overrun disable

SMARTCARD Parity

SMARTCARD_PARITY_EVEN

SMARTCARD frame even parity

SMARTCARD_PARITY_ODD

SMARTCARD frame odd parity

SMARTCARD Request Parameters

SMARTCARD_RXDATA_FLUSH_REQUEST

Receive data flush request

SMARTCARD_TXDATA_FLUSH_REQUEST

Transmit data flush request

SMARTCARD advanced feature RX pin active level inversion

SMARTCARD_ADVFEATURE_RXINV_DISABLE

RX pin active level inversion disable

SMARTCARD_ADVFEATURE_RXINV_ENABLE

RX pin active level inversion enable

SMARTCARD advanced feature RX TX pins swap

SMARTCARD_ADVFEATURE_SWAP_DISABLE

TX/RX pins swap disable

SMARTCARD_ADVFEATURE_SWAP_ENABLE

TX/RX pins swap enable

SMARTCARD State Code Definition

HAL_SMARTCARD_STATE_RESET

Peripheral is not initialized. Value is allowed for gState and RxState

HAL_SMARTCARD_STATE_READY

Peripheral Initialized and ready for use. Value is allowed for gState and RxState

HAL_SMARTCARD_STATE_BUSY

an internal process is ongoing Value is allowed for gState only

HAL_SMARTCARD_STATE_BUSY_TX

Data Transmission process is ongoing Value is allowed for gState only

HAL_SMARTCARD_STATE_BUSY_RX

Data Reception process is ongoing Value is allowed for RxState only

HAL_SMARTCARD_STATE_BUSY_TX_RX

Data Transmission and Reception process is ongoing Not to be used for neither gState nor RxState. Value is result of combination (Or) between gState and RxState values

HAL_SMARTCARD_STATE_TIMEOUT

Timeout state Value is allowed for gState only

HAL_SMARTCARD_STATE_ERROR

Error Value is allowed for gState only

SMARTCARD Number of Stop Bits

SMARTCARD_STOPBITS_0_5

SMARTCARD frame with 0.5 stop bit

SMARTCARD_STOPBITS_1_5

SMARTCARD frame with 1.5 stop bits

SMARTCARD Timeout Enable

SMARTCARD_TIMEOUT_DISABLE

SMARTCARD receiver timeout disabled

SMARTCARD_TIMEOUT_ENABLE

SMARTCARD receiver timeout enabled

SMARTCARD advanced feature TX pin active level inversion

SMARTCARD_ADVFEATURE_TXINV_DISABLE

TX pin active level inversion disable

SMARTCARD_ADVFEATURE_TXINV_ENABLE

TX pin active level inversion enable

SMARTCARD Word Length

SMARTCARD_WORDLENGTH_9B

SMARTCARD frame length

70 HAL SMARTCARD Extension Driver

70.1 SMARTCARDEx Firmware driver API description

The following section lists the various functions of the SMARTCARDEx library.

70.1.1 SMARTCARD peripheral extended features

The Extended SMARTCARD HAL driver can be used as follows:

1. After having configured the SMARTCARD basic features with HAL_SMARTCARD_Init(), then program SMARTCARD advanced features if required (TX/RX pins swap, TimeOut, auto-retry counter,...) in the hsmartcard AdvancedInit structure.
2. FIFO mode enabling/disabling and RX/TX FIFO threshold programming.

Note: When SMARTCARD operates in FIFO mode, FIFO mode must be enabled prior starting RX/TX transfers. Also RX/TX FIFO thresholds must be configured prior starting RX/TX transfers.

70.1.2 Detailed description of functions

HAL_SMARTCARDEx_BlockLength_Config

Function name

void HAL_SMARTCARDEx_BlockLength_Config (SMARTCARD_HandleTypeDef * hsmartcard, uint8_t BlockLength)

Function description

HAL_SMARTCARDEx_TimeOut_Config

Function name

void HAL_SMARTCARDEx_TimeOut_Config (SMARTCARD_HandleTypeDef * hsmartcard, uint32_t TimeOutValue)

Function description

HAL_SMARTCARDEx_EnableReceiverTimeOut

Function name

HAL_StatusTypeDef HAL_SMARTCARDEx_EnableReceiverTimeOut (SMARTCARD_HandleTypeDef * hsmartcard)

Function description

HAL_SMARTCARDEx_DisableReceiverTimeOut

Function name

HAL_StatusTypeDef HAL_SMARTCARDEx_DisableReceiverTimeOut (SMARTCARD_HandleTypeDef * hsmartcard)

Function description

HAL_SMARTCARDEx_RxFifoFullCallback

Function name

void HAL_SMARTCARDEx_RxFifoFullCallback (SMARTCARD_HandleTypeDef * hsmartcard)

Function description

HAL_SMARTCARDEx_TxFifoEmptyCallback

Function name

void HAL_SMARTCARDEx_TxFifoEmptyCallback (SMARTCARD_HandleTypeDef * hsmartcard)

Function description

HAL_SMARTCARDEx_EnableFifoMode

Function name

HAL_StatusTypeDef HAL_SMARTCARDEx_EnableFifoMode (SMARTCARD_HandleTypeDef * hsmartcard)

Function description

HAL_SMARTCARDEx_DisableFifoMode

Function name

HAL_StatusTypeDef HAL_SMARTCARDEx_DisableFifoMode (SMARTCARD_HandleTypeDef * hsmartcard)

Function description

HAL_SMARTCARDEx_SetTxFifoThreshold

Function name

HAL_StatusTypeDef HAL_SMARTCARDEx_SetTxFifoThreshold (SMARTCARD_HandleTypeDef * hsmartcard, uint32_t Threshold)

Function description

HAL_SMARTCARDEx_SetRxFifoThreshold

Function name

HAL_StatusTypeDef HAL_SMARTCARDEx_SetRxFifoThreshold (SMARTCARD_HandleTypeDef * hsmartcard, uint32_t Threshold)

Function description

70.2 SMARTCARDEx Firmware driver defines

The following section lists the various define and macros of the module.

70.2.1 SMARTCARDEx

SMARTCARDEx

SMARTCARD advanced feature initialization type

SMARTCARD_ADVFEATURE_NO_INIT

No advanced feature initialization

SMARTCARD_ADVFEATURE_TXINVERT_INIT

TX pin active level inversion

SMARTCARD_ADVFEATURE_RXINVERT_INIT

RX pin active level inversion

SMARTCARD_ADVFEATURE_DATAINVERT_INIT

Binary data inversion

SMARTCARD_ADVFEATURE_SWAP_INIT

TX/RX pins swap

SMARTCARD_ADVFEATURE_RXOVERRUNDISABLE_INIT

RX overrun disable

SMARTCARD_ADVFEATURE_DMADISABLEONERROR_INIT

DMA disable on Reception Error

SMARTCARD_ADVFEATURE_MSBFIRST_INIT

Most significant bit sent/received first

SMARTCARD_ADVFEATURE_TXCOMPLETION

TX completion indication before of after guard time

SMARTCARD FIFO mode

SMARTCARD_FIFOMODE_DISABLE

FIFO mode disable

SMARTCARD_FIFOMODE_ENABLE

FIFO mode enable

SMARTCARD Flags

SMARTCARD_FLAG_TCBGT

SMARTCARD transmission complete before guard time completion

SMARTCARD_FLAG_REACK

SMARTCARD receive enable acknowledge flag

SMARTCARD_FLAG_TEACK

SMARTCARD transmit enable acknowledge flag

SMARTCARD_FLAG_BUSY

SMARTCARD busy flag

SMARTCARD_FLAG_EOBF

SMARTCARD end of block flag

SMARTCARD_FLAG_RTOF

SMARTCARD receiver timeout flag

SMARTCARD_FLAG_TXE

SMARTCARD transmit data register empty

SMARTCARD_FLAG_TXFNF

SMARTCARD TXFIFO not full

SMARTCARD_FLAG_TC

SMARTCARD transmission complete

SMARTCARD_FLAG_RXNE

SMARTCARD read data register not empty

SMARTCARD_FLAG_RXFNE

SMARTCARD RXFIFO not empty

SMARTCARD_FLAG_IDLE

SMARTCARD idle line detection

SMARTCARD_FLAG_ORE

SMARTCARD overrun error

SMARTCARD_FLAG_NE

SMARTCARD noise error

SMARTCARD_FLAG_FE

SMARTCARD frame error

SMARTCARD_FLAG_PE

SMARTCARD parity error

SMARTCARD_FLAG_TXFE

SMARTCARD TXFIFO Empty flag

SMARTCARD_FLAG_RXFF

SMARTCARD RXFIFO Full flag

SMARTCARD_FLAG_RXFT

SMARTCARD RXFIFO threshold flag

SMARTCARD_FLAG_TXFT

SMARTCARD TXFIFO threshold flag

SMARTCARD Interrupts Definition

SMARTCARD_IT_PE

SMARTCARD parity error interruption

SMARTCARD_IT_TXE

SMARTCARD transmit data register empty interruption

SMARTCARD_IT_TXFNF

SMARTCARD TX FIFO not full interruption

SMARTCARD_IT_TC

SMARTCARD transmission complete interruption

SMARTCARD_IT_RXNE

SMARTCARD read data register not empty interruption

SMARTCARD_IT_RXFNE

SMARTCARD RXFIFO not empty interruption

SMARTCARD_IT_IDLE

SMARTCARD idle line detection interruption

SMARTCARD_IT_ERR

SMARTCARD error interruption

SMARTCARD_IT_ORE

SMARTCARD overrun error interruption

SMARTCARD_IT_NE

SMARTCARD noise error interruption

SMARTCARD_IT_FE

SMARTCARD frame error interruption

SMARTCARD_IT_EOB

SMARTCARD end of block interruption

SMARTCARD_IT_RTO

SMARTCARD receiver timeout interruption

SMARTCARD_IT_TCBGT

SMARTCARD transmission complete before guard time completion interruption

SMARTCARD_IT_RXFF

SMARTCARD RXFIFO full interruption

SMARTCARD_IT_TXFE

SMARTCARD TXFIFO empty interruption

SMARTCARD_IT_RXFT

SMARTCARD RXFIFO threshold reached interruption

SMARTCARD_IT_TXFT

SMARTCARD TXFIFO threshold reached interruption

SMARTCARD Interruption Clear Flags

SMARTCARD_CLEAR_PEF

SMARTCARD parity error clear flag

SMARTCARD_CLEAR_FEF

SMARTCARD framing error clear flag

SMARTCARD_CLEAR_NEF

SMARTCARD noise error detected clear flag

SMARTCARD_CLEAR_OREF

SMARTCARD overrun error clear flag

SMARTCARD_CLEAR_IDLEF

SMARTCARD idle line detected clear flag

SMARTCARD_CLEAR_TXFECF

TXFIFO empty Clear Flag

SMARTCARD_CLEAR_TCF

SMARTCARD transmission complete clear flag

SMARTCARD_CLEAR_TCBGTF

SMARTCARD transmission complete before guard time completion clear flag

SMARTCARD_CLEAR_RTOF

SMARTCARD receiver time out clear flag

SMARTCARD_CLEAR_EOBF

SMARTCARD end of block clear flag

SMARTCARD RXFIFO threshold level

SMARTCARD_RXFIFO_THRESHOLD_1_8

RXFIFO FIFO reaches 1/8 of its depth

SMARTCARD_RXFIFO_THRESHOLD_1_4

RXFIFO FIFO reaches 1/4 of its depth

SMARTCARD_RXFIFO_THRESHOLD_1_2

RXFIFO FIFO reaches 1/2 of its depth

SMARTCARD_RXFIFO_THRESHOLD_3_4

RXFIFO FIFO reaches 3/4 of its depth

SMARTCARD_RXFIFO_THRESHOLD_7_8

RXFIFO FIFO reaches 7/8 of its depth

SMARTCARD_RXFIFO_THRESHOLD_8_8

RXFIFO FIFO becomes full

SMARTCARD Transmission Completion Indication

SMARTCARD_TCBGT

SMARTCARD transmission complete before guard time

SMARTCARD_TC

SMARTCARD transmission complete (flag raised when guard time has elapsed)

SMARTCARD TXFIFO threshold level

SMARTCARD_TXFIFO_THRESHOLD_1_8

TXFIFO reaches 1/8 of its depth

SMARTCARD_TXFIFO_THRESHOLD_1_4

TXFIFO reaches 1/4 of its depth

SMARTCARD_TXFIFO_THRESHOLD_1_2

TXFIFO reaches 1/2 of its depth

SMARTCARD_TXFIFO_THRESHOLD_3_4

TXFIFO reaches 3/4 of its depth

SMARTCARD_TXFIFO_THRESHOLD_7_8

TXFIFO reaches 7/8 of its depth

SMARTCARD_TXFIFO_THRESHOLD_8_8

TXFIFO becomes empty

71 HAL SMBUS Generic Driver

71.1 SMBUS Firmware driver registers structures

71.1.1 SMBUS_InitTypeDef

SMBUS_InitTypeDef is defined in the stm32n6xx_hal_smbus.h

Data Fields

- ***uint32_t Timing***
- ***uint32_t AnalogFilter***
- ***uint32_t OwnAddress1***
- ***uint32_t AddressingMode***
- ***uint32_t DualAddressMode***
- ***uint32_t OwnAddress2***
- ***uint32_t OwnAddress2Masks***
- ***uint32_t GeneralCallMode***
- ***uint32_t NoStretchMode***
- ***uint32_t PacketErrorCheckMode***
- ***uint32_t PeripheralMode***
- ***uint32_t SMBusTimeout***

Field Documentation

- ***uint32_t SMBUS_InitTypeDef::Timing***
  Specifies the SMBUS_TIMINGR_register value. This parameter calculated by referring to SMBUS initialization section in Reference manual
- ***uint32_t SMBUS_InitTypeDef::AnalogFilter***
  Specifies if Analog Filter is enable or not. This parameter can be a value of ***SMBUS_Analog_Filter***
- ***uint32_t SMBUS_InitTypeDef::OwnAddress1***
  Specifies the first device own address. This parameter can be a 7-bit address.
- ***uint32_t SMBUS_InitTypeDef::AddressingMode***
  Specifies addressing mode selected. This parameter can be a value of ***SMBUS_addressing_mode***
- ***uint32_t SMBUS_InitTypeDef::DualAddressMode***
  Specifies if dual addressing mode is selected. This parameter can be a value of ***SMBUS_dual_addressing_mode***
- ***uint32_t SMBUS_InitTypeDef::OwnAddress2***
  Specifies the second device own address if dual addressing mode is selected This parameter can be a 7-bit address.
- ***uint32_t SMBUS_InitTypeDef::OwnAddress2Masks***
  Specifies the acknowledge mask address second device own address if dual addressing mode is selected This parameter can be a value of ***SMBUS_own_address2_masks***.
- ***uint32_t SMBUS_InitTypeDef::GeneralCallMode***
  Specifies if general call mode is selected. This parameter can be a value of ***SMBUS_general_call_addressing_mode***.
- ***uint32_t SMBUS_InitTypeDef::NoStretchMode***
  Specifies if nostretch mode is selected. This parameter can be a value of ***SMBUS_nostretch_mode***
- ***uint32_t SMBUS_InitTypeDef::PacketErrorCheckMode***
  Specifies if Packet Error Check mode is selected. This parameter can be a value of ***SMBUS_packet_error_check_mode***
- ***uint32_t SMBUS_InitTypeDef::PeripheralMode***
  Specifies which mode of Periphal is selected. This parameter can be a value of ***SMBUS_peripheral_mode***
- ***uint32_t SMBUS_InitTypeDef::SMBusTimeout***
  Specifies the content of the 32 Bits SMBUS_TIMEOUT_register value. (Enable bits and different timeout values) This parameter calculated by referring to SMBUS initialization section in Reference manual

71.1.2 __SMBUS_HandleTypeDef

__SMBUS_HandleTypeDef is defined in the stm32n6xx_hal_smbus.h

Data Fields

- ***I2C_TypeDef * Instance***
- ***SMBUS_InitTypeDef Init***
- ***uint8_t * pBuffPtr***
- ***uint16_t XferSize***
- ***__IO uint16_t XferCount***
- ***__IO uint32_t XferOptions***
- ***__IO uint32_t PreviousState***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t State***
- ***__IO uint32_t ErrorCode***
- ***void(* MasterTxCpltCallback***
- ***void(* MasterRxCpltCallback***
- ***void(* SlaveTxCpltCallback***
- ***void(* SlaveRxCpltCallback***
- ***void(* ListenCpltCallback***
- ***void(* ErrorCallback***
- ***void(* AddrCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***I2C_TypeDef* __SMBUS_HandleTypeDef::Instance***
  SMBUS registers base address
- ***SMBUS_InitTypeDef __SMBUS_HandleTypeDef::Init***
  SMBUS communication parameters
- ***uint8_t* __SMBUS_HandleTypeDef::pBuffPtr***
  Pointer to SMBUS transfer buffer
- ***uint16_t __SMBUS_HandleTypeDef::XferSize***
  SMBUS transfer size
- ***__IO uint16_t __SMBUS_HandleTypeDef::XferCount***
  SMBUS transfer counter
- ***__IO uint32_t __SMBUS_HandleTypeDef::XferOptions***
  SMBUS transfer options
- ***__IO uint32_t __SMBUS_HandleTypeDef::PreviousState***
  SMBUS communication Previous state
- ***HAL_LockTypeDef __SMBUS_HandleTypeDef::Lock***
  SMBUS locking object
- ***__IO uint32_t __SMBUS_HandleTypeDef::State***
  SMBUS communication state
- ***__IO uint32_t __SMBUS_HandleTypeDef::ErrorCode***
  SMBUS Error code
- ***void(* __SMBUS_HandleTypeDef::MasterTxCpltCallback)(struct __SMBUS_HandleTypeDef *hsmbus)***
  SMBUS Master Tx Transfer completed callback
- ***void(* __SMBUS_HandleTypeDef::MasterRxCpltCallback)(struct __SMBUS_HandleTypeDef *hsmbus)***
  SMBUS Master Rx Transfer completed callback
- ***void(* __SMBUS_HandleTypeDef::SlaveTxCpltCallback)(struct __SMBUS_HandleTypeDef *hsmbus)***
  SMBUS Slave Tx Transfer completed callback
- ***void(* __SMBUS_HandleTypeDef::SlaveRxCpltCallback)(struct __SMBUS_HandleTypeDef *hsmbus)***
  SMBUS Slave Rx Transfer completed callback

- ***void(* __SMBUS_HandleTypeDef::ListenCpltCallback)(struct __SMBUS_HandleTypeDef *hsmbus)***

  SMBUS Msp DeInit callback

71.2 SMBUS Firmware driver API description

The following section lists the various functions of the SMBUS library.

71.2.1 How to use this driver

The SMBUS HAL driver can be used as follows:

1. Declare a SMBUS_HandleTypeDef handle structure, for example: SMBUS_HandleTypeDef hsmbus;
2. Initialize the SMBUS low level resources by implementing the HAL_SMBUS_MspInit() API:
   a. Enable the SMBUSx interface clock
   b. SMBUS pins configuration
      - Enable the clock for the SMBUS GPIOs
      - Configure SMBUS pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the SMBUSx interrupt priority
      - Enable the NVIC SMBUS IRQ Channel
3. Configure the Communication Clock Timing, Bus Timeout, Own Address1, Master Addressing mode, Dual Addressing mode, Own Address2, Own Address2 Mask, General call, Nostretch mode, Peripheral mode and Packet Error Check mode in the hsmbus Init structure.
4. Initialize the SMBUS registers by calling the HAL_SMBUS_Init() API:
   – These API's configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL_SMBUS_MspInit(&hsmbus) API.
5. To check if target device is ready for communication, use the function HAL_SMBUS_IsDeviceReady()
6. For SMBUS IO operations, only one mode of operations is available within this driver

Interrupt mode IO operation

- Transmit in master/host SMBUS mode an amount of data in non-blocking mode using HAL_SMBUS_Master_Transmit_IT()
  – At transmission end of transfer HAL_SMBUS_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_SMBUS_MasterTxCpltCallback()
- Receive in master/host SMBUS mode an amount of data in non-blocking mode using HAL_SMBUS_Master_Receive_IT()
  – At reception end of transfer HAL_SMBUS_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_SMBUS_MasterRxCpltCallback()
- Abort a master/host SMBUS process communication with Interrupt using HAL_SMBUS_Master_Abort_IT()
  – The associated previous transfer callback is called at the end of abort process
  – mean HAL_SMBUS_MasterTxCpltCallback() in case of previous state was master transmit
  – mean HAL_SMBUS_MasterRxCpltCallback() in case of previous state was master receive

- Enable/disable the Address listen mode in slave/device or host/slave SMBUS mode using HAL_SMBUS_EnableListen_IT() HAL_SMBUS_DisableListen_IT()
  - When address slave/device SMBUS match, HAL_SMBUS_AddrCallback() is executed and users can add their own code to check the Address Match Code and the transmission direction request by master/host (Write/Read).
  - At Listen mode end HAL_SMBUS_ListenCpltCallback() is executed and users can add their own code by customization of function pointer HAL_SMBUS_ListenCpltCallback()
- Transmit in slave/device SMBUS mode an amount of data in non-blocking mode using HAL_SMBUS_Slave_Transmit_IT()
  - At transmission end of transfer HAL_SMBUS_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_SMBUS_SlaveTxCpltCallback()
- Receive in slave/device SMBUS mode an amount of data in non-blocking mode using HAL_SMBUS_Slave_Receive_IT()
  - At reception end of transfer HAL_SMBUS_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_SMBUS_SlaveRxCpltCallback()
- Enable/Disable the SMBUS alert mode using HAL_SMBUS_EnableAlert_IT() or HAL_SMBUS_DisableAlert_IT()
  - When SMBUS Alert is generated HAL_SMBUS_ErrorCallback() is executed and users can add their own code by customization of function pointer HAL_SMBUS_ErrorCallback() to check the Alert Error Code using function HAL_SMBUS_GetError()
- Get HAL state machine or error values using HAL_SMBUS_GetState() or HAL_SMBUS_GetError()
- In case of transfer Error, HAL_SMBUS_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_SMBUS_ErrorCallback() to check the Error Code using function HAL_SMBUS_GetError()

SMBUS HAL driver macros list

Below the list of most used macros in SMBUS HAL driver.

- __HAL_SMBUS_ENABLE: Enable the SMBUS peripheral
- __HAL_SMBUS_DISABLE: Disable the SMBUS peripheral
- __HAL_SMBUS_GET_FLAG: Check whether the specified SMBUS flag is set or not
- __HAL_SMBUS_CLEAR_FLAG: Clear the specified SMBUS pending flag
- __HAL_SMBUS_ENABLE_IT: Enable the specified SMBUS interrupt
- __HAL_SMBUS_DISABLE_IT: Disable the specified SMBUS interrupt

Callback registration

The compilation flag USE_HAL_SMBUS_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_SMBUS_RegisterCallback() or HAL_SMBUS_RegisterAddrCallback() to register an interrupt callback.

Function HAL_SMBUS_RegisterCallback() allows to register following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- ErrorCallback : callback for error detection.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific callback AddrCallback use dedicated register callbacks : HAL_SMBUS_RegisterAddrCallback.

Use function HAL_SMBUS_UnRegisterCallback to reset a callback to the default weak function. HAL_SMBUS_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.

- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- ErrorCallback : callback for error detection.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

For callback AddrCallback use dedicated register callbacks : HAL_SMBUS_UnRegisterAddrCallback.

By default, after the HAL_SMBUS_Init() and when the state is HAL_I2C_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_SMBUS_MasterTxCpltCallback(), HAL_SMBUS_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_SMBUS_Init()/ HAL_SMBUS_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_SMBUS_Init()/ HAL_SMBUS_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_I2C_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_I2C_STATE_READY or HAL_I2C_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_SMBUS_RegisterCallback() before calling HAL_SMBUS_DeInit() or HAL_SMBUS_Init() function.

When the compilation flag USE_HAL_SMBUS_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Note: You can refer to the SMBUS HAL driver header file for more useful macros

71.2.2 Detailed description of functions

HAL_SMBUS_Init

Function name

HAL_StatusTypeDef HAL_SMBUS_Init (SMBUS_HandleTypeDef * hsmbus)

Function description

71.3 SMBUS Firmware driver defines

The following section lists the various define and macros of the module.

71.3.1 SMBUS

SMBUS

SMBUS addressing mode

SMBUS_ADDRESSINGMODE_7BIT

SMBUS Analog Filter

SMBUS_ANALOGFILTER_ENABLE

SMBUS_ANALOGFILTER_DISABLE

SMBUS dual addressing mode

SMBUS_DUALADDRESS_DISABLE

SMBUS_DUALADDRESS_ENABLE

SMBUS Error Code definition

HAL_SMBUS_ERROR_NONE

No error

HAL_SMBUS_ERROR_BERR

BERR error

HAL_SMBUS_ERROR_ARLO

ARLO error

HAL_SMBUS_ERROR_ACKF

ACKF error

HAL_SMBUS_ERROR_OVR

OVR error

HAL_SMBUS_ERROR_HALTIMEOUT

Timeout error

HAL_SMBUS_ERROR_BUSTIMEOUT

Bus Timeout error

HAL_SMBUS_ERROR_ALERT

Alert error

HAL_SMBUS_ERROR_PECERR

PEC error

HAL_SMBUS_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_SMBUS_ERROR_INVALID_PARAM

Invalid Parameters error

SMBUS Exported Macros

__HAL_SMBUS_RESET_HANDLE_STATE

Description:

- Reset SMBUS handle state.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.

Return value:

- None

__HAL_SMBUS_ENABLE_IT

Description:

- Enable the specified SMBUS interrupts.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one of the following values:
  - SMBUS_IT_ERRI Errors interrupt enable
  - SMBUS_IT_TCI Transfer complete interrupt enable
  - SMBUS_IT_STOPI STOP detection interrupt enable
  - SMBUS_IT_NACKI NACK received interrupt enable
  - SMBUS_IT_ADDRI Address match interrupt enable
  - SMBUS_IT_RXI RX interrupt enable
  - SMBUS_IT_TXI TX interrupt enable

Return value:

- None

__HAL_SMBUS_DISABLE_IT

Description:

- Disable the specified SMBUS interrupts.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one of the following values:
  - SMBUS_IT_ERRI Errors interrupt enable
  - SMBUS_IT_TCI Transfer complete interrupt enable
  - SMBUS_IT_STOPI STOP detection interrupt enable
  - SMBUS_IT_NACKI NACK received interrupt enable
  - SMBUS_IT_ADDRI Address match interrupt enable
  - SMBUS_IT_RXI RX interrupt enable
  - SMBUS_IT_TXI TX interrupt enable

Return value:

- None

__HAL_SMBUS_GET_IT_SOURCE

Description:

- Check whether the specified SMBUS interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.
- __INTERRUPT__: specifies the SMBUS interrupt source to check. This parameter can be one of the following values:
  - SMBUS_IT_ERRI Errors interrupt enable
  - SMBUS_IT_TCI Transfer complete interrupt enable
  - SMBUS_IT_STOPI STOP detection interrupt enable
  - SMBUS_IT_NACKI NACK received interrupt enable
  - SMBUS_IT_ADDRI Address match interrupt enable
  - SMBUS_IT_RXI RX interrupt enable
  - SMBUS_IT_TXI TX interrupt enable

Return value:

- The: new state of __IT__ (SET or RESET).

SMBUS_FLAG_MASK

Description:

- Check whether the specified SMBUS flag is set or not.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SMBUS_FLAG_TXE Transmit data register empty
  - SMBUS_FLAG_TXIS Transmit interrupt status
  - SMBUS_FLAG_RXNE Receive data register not empty
  - SMBUS_FLAG_ADDR Address matched (slave mode)
  - SMBUS_FLAG_AF NACK received flag
  - SMBUS_FLAG_STOPF STOP detection flag
  - SMBUS_FLAG_TC Transfer complete (master mode)
  - SMBUS_FLAG_TCR Transfer complete reload
  - SMBUS_FLAG_BERR Bus error
  - SMBUS_FLAG_ARLO Arbitration lost
  - SMBUS_FLAG_OVR Overrun/Underrun
  - SMBUS_FLAG_PECERR PEC error in reception
  - SMBUS_FLAG_TIMEOUT Timeout or Tlow detection flag
  - SMBUS_FLAG_ALERT SMBus alert
  - SMBUS_FLAG_BUSY Bus busy
  - SMBUS_FLAG_DIR Transfer direction (slave mode)

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_SMBUS_GET_FLAG

__HAL_SMBUS_CLEAR_FLAG

Description:

- Clear the SMBUS pending flags which are cleared by writing 1 in a specific bit.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - SMBUS_FLAG_TXE Transmit data register empty
  - SMBUS_FLAG_ADDR Address matched (slave mode)
  - SMBUS_FLAG_AF NACK received flag
  - SMBUS_FLAG_STOPF STOP detection flag
  - SMBUS_FLAG_BERR Bus error
  - SMBUS_FLAG_ARLO Arbitration lost
  - SMBUS_FLAG_OVR Overrun/Underrun
  - SMBUS_FLAG_PECERR PEC error in reception
  - SMBUS_FLAG_TIMEOUT Timeout or Tlow detection flag
  - SMBUS_FLAG_ALERT SMBus alert

Return value:

- None

__HAL_SMBUS_ENABLE

Description:

- Enable the specified SMBUS peripheral.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.

Return value:

- None

__HAL_SMBUS_DISABLE

Description:

- Disable the specified SMBUS peripheral.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.

Return value:

- None

__HAL_SMBUS_GENERATE_NACK

Description:

- Generate a Non-Acknowledge SMBUS peripheral in Slave mode.

Parameters:

- __HANDLE__: specifies the SMBUS Handle.

Return value:

- None

73 HAL SPDIFRX Generic Driver

73.1 SPDIFRX Firmware driver registers structures

73.1.1 SPDIFRX_InitTypeDef

SPDIFRX_InitTypeDef is defined in the stm32n6xx_hal_spdifrx.h

Data Fields

- ***uint32_t InputSelection***
- ***uint32_t Retries***
- ***uint32_t WaitForActivity***
- ***uint32_t ChannelSelection***
- ***uint32_t DataFormat***
- ***uint32_t StereoMode***
- ***uint32_t PreambleTypeMask***
- ***uint32_t ChannelStatusMask***
- ***uint32_t ValidityBitMask***
- ***uint32_t ParityErrorMask***
- ***FunctionalState SymbolClockGen***
- ***FunctionalState BackupSymbolClockGen***

Field Documentation

- ***uint32_t SPDIFRX_InitTypeDef::InputSelection***
  Specifies the SPDIF input selection. This parameter can be a value of ***SPDIFRX_Input_Selection***
- ***uint32_t SPDIFRX_InitTypeDef::Retries***
  Specifies the Maximum allowed re-tries during synchronization phase. This parameter can be a value of ***SPDIFRX_Max_Retries***
- ***uint32_t SPDIFRX_InitTypeDef::WaitForActivity***
  Specifies the wait for activity on SPDIF selected input. This parameter can be a value of ***SPDIFRX_Wait_For_Activity***.
- ***uint32_t SPDIFRX_InitTypeDef::ChannelSelection***
  Specifies whether the control flow will take the channel status from channel A or B. This parameter can be a value of ***SPDIFRX_Channel_Selection***
- ***uint32_t SPDIFRX_InitTypeDef::DataFormat***
  Specifies the Data samples format (LSB, MSB, ...). This parameter can be a value of ***SPDIFRX_Data_Format***
- ***uint32_t SPDIFRX_InitTypeDef::StereoMode***
  Specifies whether the peripheral is in stereo or mono mode. This parameter can be a value of ***SPDIFRX_Stereo_Mode***
- ***uint32_t SPDIFRX_InitTypeDef::PreambleTypeMask***
  Specifies whether The preamble type bits are copied or not into the received frame. This parameter can be a value of ***SPDIFRX_PT_Mask***
- ***uint32_t SPDIFRX_InitTypeDef::ChannelStatusMask***
  Specifies whether the channel status and user bits are copied or not into the received frame. This parameter can be a value of ***SPDIFRX_ChannelStatus_Mask***
- ***uint32_t SPDIFRX_InitTypeDef::ValidityBitMask***
  Specifies whether the validity bit is copied or not into the received frame. This parameter can be a value of ***SPDIFRX_V_Mask***
- ***uint32_t SPDIFRX_InitTypeDef::ParityErrorMask***
  Specifies whether the parity error bit is copied or not into the received frame. This parameter can be a value of ***SPDIFRX_PE_Mask***
- ***FunctionalState SPDIFRX_InitTypeDef::SymbolClockGen***
  Enable/Disable the SPDIFRX Symbol Clock generation. This parameter can be set to Enable or Disable

- ***FunctionalState SPDIFRX_InitTypeDef::BackupSymbolClockGen***
  Enable/Disable the SPDIFRX Backup Symbol Clock generation. This parameter can be set to Enable or Disable

73.1.2 SPDIFRX_SetDataFormatTypeDef

SPDIFRX_SetDataFormatTypeDef is defined in the stm32n6xx_hal_spdifrx.h

Data Fields

- ***uint32_t DataFormat***
- ***uint32_t StereoMode***
- ***uint32_t PreambleTypeMask***
- ***uint32_t ChannelStatusMask***
- ***uint32_t ValidityBitMask***
- ***uint32_t ParityErrorMask***

Field Documentation

- ***uint32_t SPDIFRX_SetDataFormatTypeDef::DataFormat***
  Specifies the Data samples format (LSB, MSB, ...). This parameter can be a value of ***SPDIFRX_Data_Format***
- ***uint32_t SPDIFRX_SetDataFormatTypeDef::StereoMode***
  Specifies whether the peripheral is in stereo or mono mode. This parameter can be a value of ***SPDIFRX_Stereo_Mode***
- ***uint32_t SPDIFRX_SetDataFormatTypeDef::PreambleTypeMask***
  Specifies whether The preamble type bits are copied or not into the received frame. This parameter can be a value of ***SPDIFRX_PT_Mask***
- ***uint32_t SPDIFRX_SetDataFormatTypeDef::ChannelStatusMask***
  Specifies whether the channel status and user bits are copied or not into the received frame. This parameter can be a value of ***SPDIFRX_ChannelStatus_Mask***
- ***uint32_t SPDIFRX_SetDataFormatTypeDef::ValidityBitMask***
  Specifies whether the validity bit is copied or not into the received frame. This parameter can be a value of ***SPDIFRX_V_Mask***
- ***uint32_t SPDIFRX_SetDataFormatTypeDef::ParityErrorMask***
  Specifies whether the parity error bit is copied or not into the received frame. This parameter can be a value of ***SPDIFRX_PE_Mask***

73.1.3 __SPDIFRX_HandleTypeDef

__SPDIFRX_HandleTypeDef is defined in the stm32n6xx_hal_spdifrx.h

Data Fields

- ***SPDIFRX_TypeDef * Instance***
- ***SPDIFRX_InitTypeDef Init***
- ***uint32_t * pRxBuffPtr***
- ***uint32_t * pCsBuffPtr***

73.2 SPDIFRX Firmware driver API description

The following section lists the various functions of the SPDIFRX library.

73.2.1 How to use this driver

The SPDIFRX HAL driver can be used as follow:

1. Declare SPDIFRX_HandleTypeDef handle structure.

2. Initialize the SPDIFRX low level resources by implement the HAL_SPDIFRX_MspInit() API:
   a. Enable the SPDIFRX interface clock.
   b. SPDIFRX pins configuration:
      - Enable the clock for the SPDIFRX GPIOs.
      - Configure these SPDIFRX pins as alternate function pull-up.
   c. NVIC configuration if you need to use interrupt process (HAL_SPDIFRX_ReceiveCtrlFlow_IT() and HAL_SPDIFRX_ReceiveDataFlow_IT() API's).
      - Configure the SPDIFRX interrupt priority.
      - Enable the NVIC SPDIFRX IRQ handle.
   d. DMA Configuration if you need to use DMA process (HAL_SPDIFRX_ReceiveDataFlow_DMA() and HAL_SPDIFRX_ReceiveCtrlFlow_DMA() API's).
      - Declare a DMA handle structure for the reception of the Data Flow channel.
      - Declare a DMA handle structure for the reception of the Control Flow channel.
      - Enable the DMAx interface clock.
      - Configure the declared DMA handle structure CtrlRx/DataRx with the required parameters.
      - Configure the DMA Channel.
      - Associate the initialized DMA handle to the SPDIFRX DMA CtrlRx/DataRx handle.
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA CtrlRx/DataRx channel.
3. Program the input selection, re-tries number, wait for activity, channel status selection, data format, stereo mode and masking of user bits using HAL_SPDIFRX_Init() function.

Note: The specific SPDIFRX interrupts (RXNE/CSRNE and Error Interrupts) will be managed using the macros __SPDIFRX_ENABLE_IT() and __SPDIFRX_DISABLE_IT() inside the receive process.

Note: Make sure that ck_spdif clock is configured.

4. Three operation modes are available within this driver :

Polling mode for reception operation (for debug purpose)

- Receive data flow in blocking mode using HAL_SPDIFRX_ReceiveDataFlow()
- Receive control flow of data in blocking mode using HAL_SPDIFRX_ReceiveCtrlFlow()

Interrupt mode for reception operation

- Receive an amount of data (Data Flow) in non blocking mode using HAL_SPDIFRX_ReceiveDataFlow_IT()
- Receive an amount of data (Control Flow) in non blocking mode using HAL_SPDIFRX_ReceiveCtrlFlow_IT()
- At reception end of half transfer HAL_SPDIFRX_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_SPDIFRX_RxHalfCpltCallback
- At reception end of transfer HAL_SPDIFRX_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_SPDIFRX_RxCpltCallback
- In case of transfer Error, HAL_SPDIFRX_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SPDIFRX_ErrorCallback

DMA mode for reception operation

- Receive an amount of data (Data Flow) in non blocking mode (DMA) using HAL_SPDIFRX_ReceiveDataFlow_DMA()
- Receive an amount of data (Control Flow) in non blocking mode (DMA) using HAL_SPDIFRX_ReceiveCtrlFlow_DMA()
- At reception end of half transfer HAL_SPDIFRX_RxHalfCpltCallback is executed and user can add his own code by customization of function pointer HAL_SPDIFRX_RxHalfCpltCallback
- At reception end of transfer HAL_SPDIFRX_RxCpltCallback is executed and user can add his own code by customization of function pointer HAL_SPDIFRX_RxCpltCallback
- In case of transfer Error, HAL_SPDIFRX_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_SPDIFRX_ErrorCallback

- Stop the DMA Transfer using HAL_SPDIFRX_DMAStop()

SPDIFRX HAL driver macros list

Below the list of most used macros in SPDIFRX HAL driver.

- __HAL_SPDIFRX_IDLE: Disable the specified SPDIFRX peripheral (IDLE State)
- __HAL_SPDIFRX_SYNC: Enable the synchronization state of the specified SPDIFRX peripheral (SYNC State)
- __HAL_SPDIFRX_RCV: Enable the receive state of the specified SPDIFRX peripheral (RCV State)
- __HAL_SPDIFRX_ENABLE_IT : Enable the specified SPDIFRX interrupts
- __HAL_SPDIFRX_DISABLE_IT : Disable the specified SPDIFRX interrupts
- __HAL_SPDIFRX_GET_FLAG: Check whether the specified SPDIFRX flag is set or not.

Note: You can refer to the SPDIFRX HAL driver header file for more useful macros

Callback registration

73.2.2 Detailed description of functions

HAL_SPDIFRX_Init

Function name

HAL_StatusTypeDef HAL_SPDIFRX_Init (SPDIFRX_HandleTypeDef * hspdif)

Function description

HAL_SPDIFRX_DeInit

Function name

HAL_StatusTypeDef HAL_SPDIFRX_DeInit (SPDIFRX_HandleTypeDef * hspdif)

Function description

73.3 SPDIFRX Firmware driver defines

The following section lists the various define and macros of the module.

73.3.1 SPDIFRX

SPDIFRX

SPDIFRX Channel Status Mask

SPDIFRX_CHANNELSTATUS_OFF

SPDIFRX_CHANNELSTATUS_ON

SPDIFRX Channel Selection

SPDIFRX_CHANNEL_A

SPDIFRX_CHANNEL_B

SPDIFRX Data Format

SPDIFRX_DATAFORMAT_LSB

SPDIFRX_DATAFORMAT_MSB

SPDIFRX_DATAFORMAT_32BITS

SPDIFRX Error Code

HAL_SPDIFRX_ERROR_NONE

No error

HAL_SPDIFRX_ERROR_TIMEOUT

Timeout error

HAL_SPDIFRX_ERROR_OVR

OVR error

HAL_SPDIFRX_ERROR_PE

Parity error

HAL_SPDIFRX_ERROR_DMA

DMA transfer error

HAL_SPDIFRX_ERROR_UNKNOWN

Unknown Error error

HAL_SPDIFRX_ERROR_INVALID_CALLBACK

Invalid Callback error

SPDIFRX Exported Macros

__HAL_SPDIFRX_RESET_HANDLE_STATE

Description:

- Reset SPDIFRX handle state.

Parameters:

- __HANDLE__: SPDIFRX handle.

Return value:

- None

__HAL_SPDIFRX_IDLE

Description:

- Disable the specified SPDIFRX peripheral (IDLE State).

Parameters:

- __HANDLE__: specifies the SPDIFRX Handle.

Return value:

- None

__HAL_SPDIFRX_SYNC

Description:

- Enable the specified SPDIFRX peripheral (SYNC State).

Parameters:

- __HANDLE__: specifies the SPDIFRX Handle.

Return value:

- None

__HAL_SPDIFRX_RCV

Description:

- Enable the specified SPDIFRX peripheral (RCV State).

Parameters:

- __HANDLE__: specifies the SPDIFRX Handle.

Return value:

- None

__HAL_SPDIFRX_ENABLE_IT

Description:

- Enable or disable the specified SPDIFRX interrupts.

Parameters:

- __HANDLE__: specifies the SPDIFRX Handle.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - SPDIFRX_IT_RXNE
  - SPDIFRX_IT_CSRNE
  - SPDIFRX_IT_PERRIE
  - SPDIFRX_IT_OVRIE
  - SPDIFRX_IT_SBLKIE
  - SPDIFRX_IT_SYNCDIE
  - SPDIFRX_IT_IFEIE

Return value:

- None

__HAL_SPDIFRX_DISABLE_IT

__HAL_SPDIFRX_GET_IT_SOURCE

Description:

- Checks if the specified SPDIFRX interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: specifies the SPDIFRX Handle.
- __INTERRUPT__: specifies the SPDIFRX interrupt source to check. This parameter can be one of the following values:
  - SPDIFRX_IT_RXNE
  - SPDIFRX_IT_CSRNE
  - SPDIFRX_IT_PERRIE
  - SPDIFRX_IT_OVRIE
  - SPDIFRX_IT_SBLKIE
  - SPDIFRX_IT_SYNCDIE
  - SPDIFRX_IT_IFEIE

Return value:

- The: new state of __IT__ (TRUE or FALSE).

__HAL_SPDIFRX_GET_FLAG

Description:

- Checks whether the specified SPDIFRX flag is set or not.

Parameters:

- __HANDLE__: specifies the SPDIFRX Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SPDIFRX_FLAG_RXNE
  - SPDIFRX_FLAG_CSRNE
  - SPDIFRX_FLAG_PERR
  - SPDIFRX_FLAG_OVR
  - SPDIFRX_FLAG_SBD
  - SPDIFRX_FLAG_SYNCD
  - SPDIFRX_FLAG_FERR
  - SPDIFRX_FLAG_SERR
  - SPDIFRX_FLAG_TERR

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_SPDIFRX_CLEAR_IT

Description:

- Clears the specified SPDIFRX SR flag, in setting the proper IFCR register bit.

Parameters:

- __HANDLE__: specifies the USART Handle.
- __IT_CLEAR__: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt This parameter can be one of the following values:
  - SPDIFRX_FLAG_PERR
  - SPDIFRX_FLAG_OVR
  - SPDIFRX_SR_SBD
  - SPDIFRX_SR_SYNCD

Return value:

- None

- ***uint32_t IOSwap***
- ***uint32_t ReadyMasterManagement***
- ***uint32_t ReadyPolarity***

Field Documentation

- ***uint32_t SPI_InitTypeDef::Mode***
  Specifies the SPI operating mode. This parameter can be a value of ***SPI_Mode***
- ***uint32_t SPI_InitTypeDef::Direction***
  Specifies the SPI bidirectional mode state. This parameter can be a value of ***SPI_Direction***
- ***uint32_t SPI_InitTypeDef::DataSize***
  Specifies the SPI data size. This parameter can be a value of ***SPI_Data_Size***
- ***uint32_t SPI_InitTypeDef::CLKPolarity***
  Specifies the serial clock steady state. This parameter can be a value of ***SPI_Clock_Polarity***
- ***uint32_t SPI_InitTypeDef::CLKPhase***
  Specifies the clock active edge for the bit capture. This parameter can be a value of ***SPI_Clock_Phase***
- ***uint32_t SPI_InitTypeDef::NSS***
  Specifies whether the NSS signal is managed by hardware (NSS pin) or by software using the SSI bit. This parameter can be a value of ***SPI_Slave_Select_Management***
- ***uint32_t SPI_InitTypeDef::BaudRatePrescaler***
  Specifies the Baud Rate prescaler value which will be used to configure the transmit and receive SCK clock. This parameter can be a value of ***SPI_BaudRate_Prescaler***
  Note:
  – The communication clock is derived from the master clock. The slave clock does not need to be set.

- ***uint32_t SPI_InitTypeDef::FirstBit***
  Specifies whether data transfers start from MSB or LSB bit. This parameter can be a value of ***SPI_MSB_LSB_Transmission***
- ***uint32_t SPI_InitTypeDef::TIMode***
  Specifies if the TI mode is enabled or not. This parameter can be a value of ***SPI_TI_Mode***
- ***uint32_t SPI_InitTypeDef::CRCCalculation***
  Specifies if the CRC calculation is enabled or not. This parameter can be a value of ***SPI_CRC_Calculation***
- ***uint32_t SPI_InitTypeDef::CRCPolynomial***
  Specifies the polynomial used for the CRC calculation. This parameter must be an odd number between Min_Data = 0 and Max_Data = 65535
- ***uint32_t SPI_InitTypeDef::CRCLength***
  Specifies the CRC Length used for the CRC calculation. This parameter can be a value of ***SPI_CRC_length***
- ***uint32_t SPI_InitTypeDef::NSSPMode***
  Specifies whether the NSSP signal is enabled or not . This parameter can be a value of ***SPI_NSSP_Mode***
  This mode is activated by the SSOM bit in the SPIx_CR2 register and it takes effect only if the SPI interface is configured as Motorola SPI master (FRF=0).
- ***uint32_t SPI_InitTypeDef::NSSPolarity***
  Specifies which level of SS input/output external signal (present on SS pin) is considered as active one. This parameter can be a value of ***SPI_NSS_Polarity***
- ***uint32_t SPI_InitTypeDef::FifoThreshold***
  Specifies the FIFO threshold level. This parameter can be a value of ***SPI_Fifo_Threshold***
- ***uint32_t SPI_InitTypeDef::TxCRCInitializationPattern***
  Specifies the transmitter CRC initialization Pattern used for the CRC calculation. This parameter can be a value of ***SPI_CRC_Calculation_Initialization_Pattern***
- ***uint32_t SPI_InitTypeDef::RxCRCInitializationPattern***
  Specifies the receiver CRC initialization Pattern used for the CRC calculation. This parameter can be a value of ***SPI_CRC_Calculation_Initialization_Pattern***
- ***uint32_t SPI_InitTypeDef::MasterSSIdleness***
  Specifies an extra delay, expressed in number of SPI clock cycle periods, inserted additionally between active edge of SS and first data transaction start in master mode. This parameter can be a value of ***SPI_Master_SS_Idleness***
- ***uint32_t SPI_InitTypeDef::MasterInterDataIdleness***
  Specifies minimum time delay (expressed in SPI clock cycles periods) inserted between two consecutive data frames in master mode. This parameter can be a value of ***SPI_Master_InterData_Idleness***
- ***uint32_t SPI_InitTypeDef::MasterReceiverAutoSusp***
  Control continuous SPI transfer in master receiver mode and automatic management in order to avoid overrun condition. This parameter can be a value of ***SPI_Master_RX_AutoSuspend***
- ***uint32_t SPI_InitTypeDef::MasterKeepIOState***
  Control of Alternate function GPIOs state This parameter can be a value of ***SPI_Master_Keep_IO_State***
- ***uint32_t SPI_InitTypeDef::IOSwap***
  Invert MISO/MOSI alternate functions This parameter can be a value of ***SPI_IO_Swap***
- ***uint32_t SPI_InitTypeDef::ReadyMasterManagement***
  Specifies if RDY Signal is managed internally or not. This parameter can be a value of ***SPI_RDY_Master_Management***
- ***uint32_t SPI_InitTypeDef::ReadyPolarity***
  Specifies which level of RDY Signal input (present on RDY pin) is considered as active one. This parameter can be a value of ***SPI_RDY_Polarity***

74.1.2 __SPI_HandleTypeDef

__SPI_HandleTypeDef is defined in the stm32n6xx_hal_spi.h

74.2 SPI Firmware driver API description

The following section lists the various functions of the SPI library.

74.2.1 How to use this driver

The SPI HAL driver can be used as follows:

1. Declare a SPI_HandleTypeDef handle structure, for example: SPI_HandleTypeDef hspi;
2. Initialize the SPI low level resources by implementing the HAL_SPI_MspInit() API:
   a. Enable the SPIx interface clock
   b. SPI pins configuration
      - Enable the clock for the SPI GPIOs
      - Configure these SPI pins as alternate function push-pull
   c. NVIC configuration if you need to use interrupt process or DMA process
      - Configure the SPIx interrupt priority
      - Enable the NVIC SPI IRQ handle
   d. DMA Configuration if you need to use DMA process
      - Declare a DMA_HandleTypeDef handle structure for the transmit or receive Stream/Channel
      - Enable the DMAx clock
      - Configure the DMA handle parameters
      - Configure the DMA Tx or Rx Stream/Channel
      - Associate the initialized hdma_tx handle to the hspi DMA Tx or Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx or Rx Stream/Channel
3. Program the Mode, BidirectionalMode , Data size, Baudrate Prescaler, NSS management, Clock polarity and phase, FirstBit and CRC configuration in the hspi Init structure.

4. Initialize the SPI registers by calling the HAL_SPI_Init() API:
   – This API configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL_SPI_MspInit() API.

Callback registration:

1. The compilation flag USE_HAL_SPI_REGISTER_CALLBACKS when set to 1UL allows the user to configure dynamically the driver callbacks. Use Functions HAL_SPI_RegisterCallback() to register an interrupt callback. Function HAL_SPI_RegisterCallback() allows to register following callbacks:
   – TxCpltCallback : SPI Tx Completed callback
   – RxCpltCallback : SPI Rx Completed callback
   – TxRxCpltCallback : SPI TxRx Completed callback
   – TxHalfCpltCallback : SPI Tx Half Completed callback
   – RxHalfCpltCallback : SPI Rx Half Completed callback
   – TxRxHalfCpltCallback : SPI TxRx Half Completed callback
   – ErrorCallback : SPI Error callback
   – AbortCpltCallback : SPI Abort callback
   – SuspendCallback : SPI Suspend callback
   – MspInitCallback : SPI Msp Init callback
   – MspDeInitCallback : SPI Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
2. Use function HAL_SPI_UnRegisterCallback to reset a callback to the default weak function. HAL_SPI_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
   – TxCpltCallback : SPI Tx Completed callback
   – RxCpltCallback : SPI Rx Completed callback
   – TxRxCpltCallback : SPI TxRx Completed callback
   – TxHalfCpltCallback : SPI Tx Half Completed callback
   – RxHalfCpltCallback : SPI Rx Half Completed callback
   – TxRxHalfCpltCallback : SPI TxRx Half Completed callback
   – ErrorCallback : SPI Error callback
   – AbortCpltCallback : SPI Abort callback
   – SuspendCallback : SPI Suspend callback
   – MspInitCallback : SPI Msp Init callback
   – MspDeInitCallback : SPI Msp DeInit callback
3. By default, after the HAL_SPI_Init() and when the state is HAL_SPI_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_SPI_MasterTxCpltCallback(), HAL_SPI_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_SPI_Init()/ HAL_SPI_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_SPI_Init()/ HAL_SPI_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.
4. Callbacks can be registered/unregistered in HAL_SPI_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_SPI_STATE_READY or HAL_SPI_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_SPI_RegisterCallback() before calling HAL_SPI_DeInit() or HAL_SPI_Init() function.
5. When The compilation define USE_HAL_PPP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.
6. SuspendCallback restriction: SuspendCallback is called only when MasterReceiverAutoSusp is enabled and EOT interrupt is activated. SuspendCallback is used in relation with functions HAL_SPI_Transmit_IT, HAL_SPI_Receive_IT and HAL_SPI_TransmitReceive_IT.

Circular mode restriction:

- The DMA circular mode cannot be used when the SPI is configured in these modes:
  – Master 2Lines RxOnly
  – Master 1Line Rx

- The CRC feature is not managed when the DMA circular mode is enabled
- The functions HAL_SPI_DMAPause()/ HAL_SPI_DMAResume() are not supported. Return always HAL_ERROR with ErrorCode set to HAL_SPI_ERROR_NOT_SUPPORTED. Those functions are maintained for backward compatibility reasons.

74.2.2 Detailed description of functions

HAL_SPI_Init

Function name

HAL_StatusTypeDef HAL_SPI_Init (SPI_HandleTypeDef * hspi)

Function description

HAL_SPI_DeInit

Function name

HAL_StatusTypeDef HAL_SPI_DeInit (SPI_HandleTypeDef * hspi)

Function description

HAL_SPI_MspInit

Function name

void HAL_SPI_MspInit (SPI_HandleTypeDef * hspi)

Function description

HAL_SPI_MspDeInit

Function name

void HAL_SPI_MspDeInit (SPI_HandleTypeDef * hspi)

Function description

HAL_SPI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_SPI_RegisterCallback (SPI_HandleTypeDef * hspi, HAL_SPI_CallbackIDTypeDef CallbackID, pSPI_CallbackTypeDef pCallback)

Function description

HAL_SPI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_SPI_UnRegisterCallback (SPI_HandleTypeDef * hspi, HAL_SPI_CallbackIDTypeDef CallbackID)

Function description

HAL_SPI_Transmit

Function name

HAL_StatusTypeDef HAL_SPI_Transmit (SPI_HandleTypeDef * hspi, const uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

HAL_SPI_Receive

Function name

HAL_StatusTypeDef HAL_SPI_Receive (SPI_HandleTypeDef * hspi, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

HAL_SPI_TransmitReceive

Function name

HAL_StatusTypeDef HAL_SPI_TransmitReceive (SPI_HandleTypeDef * hspi, const uint8_t * pTxData, uint8_t * pRxData, uint16_t Size, uint32_t Timeout)

SPI Exported Macros

__HAL_SPI_RESET_HANDLE_STATE

Description:

- Reset SPI handle state.

Parameters:

- __HANDLE__: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, 3, 4, 5 or 6 to select the SPI peripheral.

Return value:

- None

__HAL_SPI_ENABLE_IT

Description:

- Enable the specified SPI interrupts.

Parameters:

- __HANDLE__: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, 3, 4, 5 or 6 to select the SPI peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - SPI_IT_RXP : Rx-Packet available interrupt
  - SPI_IT_TXP : Tx-Packet space available interrupt
  - SPI_IT_DXP : Duplex Packet interrupt
  - SPI_IT_EOT : End of transfer interrupt
  - SPI_IT_TXTF : Transmission Transfer Filled interrupt
  - SPI_IT_UDR : Underrun interrupt
  - SPI_IT_OVR : Overrun interrupt
  - SPI_IT_CRCERR : CRC error interrupt
  - SPI_IT_FRE : TI mode frame format error interrupt
  - SPI_IT_MODF : Mode fault interrupt
  - SPI_IT_ERR : Error interrupt

Return value:

- None

__HAL_SPI_DISABLE_IT

Description:

- Disable the specified SPI interrupts.

Parameters:

- __HANDLE__: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, 3, 4, 5 or 6 to select the SPI peripheral.
- __INTERRUPT__: specifies the interrupt source to enable or disable. This parameter can be one of the following values:
  - SPI_IT_RXP : Rx-Packet available interrupt
  - SPI_IT_TXP : Tx-Packet space available interrupt
  - SPI_IT_DXP : Duplex Packet interrupt
  - SPI_IT_EOT : End of transfer interrupt
  - SPI_IT_TXTF : Transmission Transfer Filled interrupt
  - SPI_IT_UDR : Underrun interrupt
  - SPI_IT_OVR : Overrun interrupt
  - SPI_IT_CRCERR : CRC error interrupt
  - SPI_IT_FRE : TI mode frame format error interrupt
  - SPI_IT_MODF : Mode fault interrupt
  - SPI_IT_ERR : Error interrupt

Return value:

- None

__HAL_SPI_GET_IT_SOURCE

Description:

- Check whether the specified SPI interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, 3, 4, 5 or 6 to select the SPI peripheral.
- __INTERRUPT__: specifies the SPI interrupt source to check. This parameter can be one of the following values:
  - SPI_IT_RXP : Rx-Packet available interrupt
  - SPI_IT_TXP : Tx-Packet space available interrupt
  - SPI_IT_DXP : Duplex Packet interrupt
  - SPI_IT_EOT : End of transfer interrupt
  - SPI_IT_TXTF : Transmission Transfer Filled interrupt
  - SPI_IT_UDR : Underrun interrupt
  - SPI_IT_OVR : Overrun interrupt
  - SPI_IT_CRCERR : CRC error interrupt
  - SPI_IT_FRE : TI mode frame format error interrupt
  - SPI_IT_MODF : Mode fault interrupt
  - SPI_IT_ERR : Error interrupt

Return value:

- The: new state of __IT__ (TRUE or FALSE).

__HAL_SPI_GET_FLAG

Description:

- Check whether the specified SPI flag is set or not.

Parameters:

- __HANDLE__: specifies the SPI Handle. This parameter can be SPI where x: 1, 2, 3, 4, 5 or 6 to select the SPI peripheral.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SPI_FLAG_RXP : Rx-Packet available flag
  - SPI_FLAG_TXP : Tx-Packet space available flag
  - SPI_FLAG_DXP : Duplex Packet flag
  - SPI_FLAG_EOT : End of transfer flag
  - SPI_FLAG_TXTF : Transmission Transfer Filled flag
  - SPI_FLAG_UDR : Underrun flag
  - SPI_FLAG_OVR : Overrun flag
  - SPI_FLAG_CRCERR : CRC error flag
  - SPI_FLAG_FRE : TI mode frame format error flag
  - SPI_FLAG_MODF : Mode fault flag
  - SPI_FLAG_SUSP : Transfer suspend complete flag
  - SPI_FLAG_TXC : TxFIFO transmission complete flag
  - SPI_FLAG_FRLVL : Fifo reception level flag
  - SPI_FLAG_RXWNE : RxFIFO word not empty flag

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_SPI_CLEAR_CRCERRFLAG

Description:

- Clear the SPI CRCERR pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_CLEAR_MODFFLAG

Description:

- Clear the SPI MODF pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_CLEAR_OVRFLAG

Description:

- Clear the SPI OVR pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_CLEAR_FREFLAG

Description:

- Clear the SPI FRE pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_CLEAR_UDRFLAG

Description:

- Clear the SPI UDR pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_CLEAR_EOTFLAG

Description:

- Clear the SPI EOT pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_CLEAR_TXTFFLAG

Description:

- Clear the SPI UDR pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_CLEAR_SUSPFLAG

Description:

- Clear the SPI SUSP pending flag.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_ENABLE

Description:

- Enable the SPI peripheral.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

__HAL_SPI_DISABLE

Description:

- Disable the SPI peripheral.

Parameters:

- __HANDLE__: specifies the SPI Handle.

Return value:

- None

76.2 SRAM Firmware driver API description

The following section lists the various functions of the SRAM library.

76.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control SRAM memories. It uses the FMC layer functions to interface with SRAM devices. The following sequence should be followed to configure the FMC to interface with SRAM/PSRAM memories:

1. Declare a SRAM_HandleTypeDef handle structure, for example: SRAM_HandleTypeDef hsram; and:
   – Fill the SRAM_HandleTypeDef handle "Init" field with the allowed values of the structure member.
   – Fill the SRAM_HandleTypeDef handle "Instance" field with a predefined base register instance for NOR or SRAM device
   – Fill the SRAM_HandleTypeDef handle "Extended" field with a predefined base register instance for NOR or SRAM extended mode
2. Declare two FMC_NORSRAM_TimingTypeDef structures, for both normal and extended mode timings; for example: FMC_NORSRAM_TimingTypeDef Timing and FMC_NORSRAM_TimingTypeDef ExTiming; and fill its fields with the allowed values of the structure member.
3. Initialize the SRAM Controller by calling the function HAL_SRAM_Init(). This function performs the following sequence:
   a. MSP hardware layer configuration using the function HAL_SRAM_MspInit()
   b. Control register configuration using the FMC NORSRAM interface function FMC_NORSRAM_Init()
   c. Timing register configuration using the FMC NORSRAM interface function FMC_NORSRAM_Timing_Init()
   d. Extended mode Timing register configuration using the FMC NORSRAM interface function FMC_NORSRAM_Extended_Timing_Init()
   e. Enable the SRAM device using the macro __FMC_NORSRAM_ENABLE()
4. At this stage you can perform read/write accesses from/to the memory connected to the NOR/SRAM Bank. You can perform either polling or DMA transfer using the following APIs:
   – HAL_SRAM_Read()/HAL_SRAM_Write() for polling read/write access
   – HAL_SRAM_Read_DMA()/HAL_SRAM_Write_DMA() for DMA read/write transfer
5. You can also control the SRAM device by calling the control APIs HAL_SRAM_WriteOperation_Enable()/ HAL_SRAM_WriteOperation_Disable() to respectively enable/disable the SRAM write operation
6. You can continuously monitor the SRAM device HAL state by calling the function HAL_SRAM_GetState()

Callback registration

The compilation define USE_HAL_SRAM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_SRAM_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : SRAM MspInit.
- MspDeInitCallback : SRAM MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_SRAM_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- MspInitCallback : SRAM MspInit.
- MspDeInitCallback : SRAM MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_SRAM_Init and if the state is HAL_SRAM_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_SRAM_Init and HAL_SRAM_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_SRAM_Init and HAL_SRAM_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_SRAM_RegisterCallback before calling HAL_SRAM_DeInit or HAL_SRAM_Init function. When The compilation define USE_HAL_SRAM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

Function description

76.3 SRAM Firmware driver defines

The following section lists the various define and macros of the module.

76.3.1 SRAM

SRAM

SRAM Exported Macros

__HAL_SRAM_RESET_HANDLE_STATE

Description:

- Reset SRAM handle state.

Parameters:

- __HANDLE__: SRAM handle

Return value:

- None

77 HAL TIM Generic Driver

77.1 TIM Firmware driver registers structures

77.1.1 TIM_Base_InitTypeDef

TIM_Base_InitTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t Prescaler***
- ***uint32_t CounterMode***
- ***uint32_t Period***
- ***uint32_t ClockDivision***
- ***uint32_t RepetitionCounter***
- ***uint32_t AutoReloadPreload***

Field Documentation

- ***uint32_t TIM_Base_InitTypeDef::Prescaler***
  Specifies the prescaler value used to divide the TIM clock. This parameter can be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF Macro **__HAL_TIM_CALC_PSC()** can be used to calculate prescaler value
- ***uint32_t TIM_Base_InitTypeDef::CounterMode***
  Specifies the counter mode. This parameter can be a value of ***TIM_Counter_Mode***
- ***uint32_t TIM_Base_InitTypeDef::Period***
  Specifies the period value to be loaded into the active Auto-Reload Register at the next update event. This parameter can be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF (or 0xFFEF if dithering is activated)Macros **__HAL_TIM_CALC_PERIOD()**, **__HAL_TIM_CALC_PERIOD_DITHER()**,**__HAL_TIM_CALC_PERIOD_BY_DELAY()**, **__HAL_TIM_CALC_PERIOD_DITHER_BY_DELAY()**can be used to calculate Period value
- ***uint32_t TIM_Base_InitTypeDef::ClockDivision***
  Specifies the clock division. This parameter can be a value of ***TIM_ClockDivision***
- ***uint32_t TIM_Base_InitTypeDef::RepetitionCounter***
  Specifies the repetition counter value. Each time the RCR downcounter reaches zero, an update event is generated and counting restarts from the RCR value (N). This means in PWM mode that (N+1) corresponds to:
  - the number of PWM periods in edge-aligned mode
  - the number of half PWM period in center-aligned mode GP timers: this parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF. Advanced timers: this parameter must be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF.
- ***uint32_t TIM_Base_InitTypeDef::AutoReloadPreload***
  Specifies the auto-reload preload. This parameter can be a value of ***TIM_AutoReloadPreload***

77.1.2 TIM_OC_InitTypeDef

TIM_OC_InitTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t OCMode***
- ***uint32_t Pulse***
- ***uint32_t OCPolarity***
- ***uint32_t OCNPolarity***
- ***uint32_t OCFastMode***
- ***uint32_t OCIdleState***
- ***uint32_t OCNIdleState***

Field Documentation

- ***uint32_t TIM_OC_InitTypeDef::OCMode***
  Specifies the TIM mode. This parameter can be a value of ***TIM_Output_Compare_and_PWM_modes***
- ***uint32_t TIM_OC_InitTypeDef::Pulse***
  Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF (or 0xFFEF if dithering is activated) Macros **__HAL_TIM_CALC_PULSE()**, **__HAL_TIM_CALC_PULSE_DITHER()** can be used to calculate Pulse value
- ***uint32_t TIM_OC_InitTypeDef::OCPolarity***
  Specifies the output polarity. This parameter can be a value of ***TIM_Output_Compare_Polarity***
- ***uint32_t TIM_OC_InitTypeDef::OCNPolarity***
  Specifies the complementary output polarity. This parameter can be a value of ***TIM_Output_Compare_N_Polarity***
  Note:
  – This parameter is valid only for timer instances supporting break feature.
- ***uint32_t TIM_OC_InitTypeDef::OCFastMode***
  Specifies the Fast mode state. This parameter can be a value of ***TIM_Output_Fast_State***
  Note:
  – This parameter is valid only in PWM1 and PWM2 mode.
- ***uint32_t TIM_OC_InitTypeDef::OCIdleState***
  Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of ***TIM_Output_Compare_Idle_State***
  Note:
  – This parameter is valid only for timer instances supporting break feature.
- ***uint32_t TIM_OC_InitTypeDef::OCNIdleState***
  Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of ***TIM_Output_Compare_N_Idle_State***
  Note:
  – This parameter is valid only for timer instances supporting break feature.

77.1.3 TIM_OnePulse_InitTypeDef

TIM_OnePulse_InitTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t OCMode***
- ***uint32_t Pulse***
- ***uint32_t OCPolarity***
- ***uint32_t OCNPolarity***
- ***uint32_t OCIdleState***
- ***uint32_t OCNIdleState***
- ***uint32_t ICPolarity***
- ***uint32_t ICSelection***
- ***uint32_t ICFilter***

Field Documentation

- ***uint32_t TIM_OnePulse_InitTypeDef::OCMode***
  Specifies the TIM mode. This parameter can be a value of ***TIM_Output_Compare_and_PWM_modes***
- ***uint32_t TIM_OnePulse_InitTypeDef::Pulse***
  Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF (or 0xFFEF if dithering is activated) Macros **__HAL_TIM_CALC_PULSE()**, **__HAL_TIM_CALC_PULSE_DITHER()** can be used to calculate Pulse value
- ***uint32_t TIM_OnePulse_InitTypeDef::OCPolarity***
  Specifies the output polarity. This parameter can be a value of ***TIM_Output_Compare_Polarity***

- ***uint32_t TIM_OnePulse_InitTypeDef::OCNPolarity***
  Specifies the complementary output polarity. This parameter can be a value of ***TIM_Output_Compare_N_Polarity***
  Note:
  – This parameter is valid only for timer instances supporting break feature.
- ***uint32_t TIM_OnePulse_InitTypeDef::OCIdleState***
  Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of ***TIM_Output_Compare_Idle_State***
  Note:
  – This parameter is valid only for timer instances supporting break feature.
- ***uint32_t TIM_OnePulse_InitTypeDef::OCNIdleState***
  Specifies the TIM Output Compare pin state during Idle state. This parameter can be a value of ***TIM_Output_Compare_N_Idle_State***
  Note:
  – This parameter is valid only for timer instances supporting break feature.
- ***uint32_t TIM_OnePulse_InitTypeDef::ICPolarity***
  Specifies the active edge of the input signal. This parameter can be a value of ***TIM_Input_Capture_Polarity***
- ***uint32_t TIM_OnePulse_InitTypeDef::ICSelection***
  Specifies the input. This parameter can be a value of ***TIM_Input_Capture_Selection***
- ***uint32_t TIM_OnePulse_InitTypeDef::ICFilter***
  Specifies the input capture filter. This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF

77.1.4 TIM_IC_InitTypeDef

TIM_IC_InitTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t ICPolarity***
- ***uint32_t ICSelection***
- ***uint32_t ICPrescaler***
- ***uint32_t ICFilter***

Field Documentation

- ***uint32_t TIM_IC_InitTypeDef::ICPolarity***
  Specifies the active edge of the input signal. This parameter can be a value of ***TIM_Input_Capture_Polarity***
- ***uint32_t TIM_IC_InitTypeDef::ICSelection***
  Specifies the input. This parameter can be a value of ***TIM_Input_Capture_Selection***
- ***uint32_t TIM_IC_InitTypeDef::ICPrescaler***
  Specifies the Input Capture Prescaler. This parameter can be a value of ***TIM_Input_Capture_Prescaler***
- ***uint32_t TIM_IC_InitTypeDef::ICFilter***
  Specifies the input capture filter. This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF

77.1.5 TIM_Encoder_InitTypeDef

TIM_Encoder_InitTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t EncoderMode***
- ***uint32_t IC1Polarity***
- ***uint32_t IC1Selection***
- ***uint32_t IC1Prescaler***
- ***uint32_t IC1Filter***
- ***uint32_t IC2Polarity***
- ***uint32_t IC2Selection***
- ***uint32_t IC2Prescaler***

- ***uint32_t IC2Filter***

Field Documentation

- ***uint32_t TIM_Encoder_InitTypeDef::EncoderMode***
  Specifies the active edge of the input signal. This parameter can be a value of ***TIM_Encoder_Mode***
- ***uint32_t TIM_Encoder_InitTypeDef::IC1Polarity***
  Specifies the active edge of the input signal. This parameter can be a value of ***TIM_Encoder_Input_Polarity***
- ***uint32_t TIM_Encoder_InitTypeDef::IC1Selection***
  Specifies the input. This parameter can be a value of ***TIM_Input_Capture_Selection***
- ***uint32_t TIM_Encoder_InitTypeDef::IC1Prescaler***
  Specifies the Input Capture Prescaler. This parameter can be a value of ***TIM_Input_Capture_Prescaler***
- ***uint32_t TIM_Encoder_InitTypeDef::IC1Filter***
  Specifies the input capture filter. This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF
- ***uint32_t TIM_Encoder_InitTypeDef::IC2Polarity***
  Specifies the active edge of the input signal. This parameter can be a value of ***TIM_Encoder_Input_Polarity***
- ***uint32_t TIM_Encoder_InitTypeDef::IC2Selection***
  Specifies the input. This parameter can be a value of ***TIM_Input_Capture_Selection***
- ***uint32_t TIM_Encoder_InitTypeDef::IC2Prescaler***
  Specifies the Input Capture Prescaler. This parameter can be a value of ***TIM_Input_Capture_Prescaler***
- ***uint32_t TIM_Encoder_InitTypeDef::IC2Filter***
  Specifies the input capture filter. This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF

77.1.6 TIM_ClockConfigTypeDef

TIM_ClockConfigTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t ClockSource***
- ***uint32_t ClockPolarity***
- ***uint32_t ClockPrescaler***
- ***uint32_t ClockFilter***

Field Documentation

- ***uint32_t TIM_ClockConfigTypeDef::ClockSource***
  TIM clock sources This parameter can be a value of ***TIM_Clock_Source***
- ***uint32_t TIM_ClockConfigTypeDef::ClockPolarity***
  TIM clock polarity This parameter can be a value of ***TIM_Clock_Polarity***
- ***uint32_t TIM_ClockConfigTypeDef::ClockPrescaler***
  TIM clock prescaler This parameter can be a value of ***TIM_Clock_Prescaler***
- ***uint32_t TIM_ClockConfigTypeDef::ClockFilter***
  TIM clock filter This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF

77.1.7 TIM_ClearInputConfigTypeDef

TIM_ClearInputConfigTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t ClearInputState***
- ***uint32_t ClearInputSource***
- ***uint32_t ClearInputPolarity***
- ***uint32_t ClearInputPrescaler***
- ***uint32_t ClearInputFilter***

Field Documentation

- ***uint32_t TIM_ClearInputConfigTypeDef::ClearInputState***
  TIM clear Input state This parameter can be ENABLE or DISABLE

- ***uint32_t TIM_ClearInputConfigTypeDef::ClearInputSource***
  TIM clear Input sources This parameter can be a value of ***TIM_ClearInput_Source***
- ***uint32_t TIM_ClearInputConfigTypeDef::ClearInputPolarity***
  TIM Clear Input polarity This parameter can be a value of ***TIM_ClearInput_Polarity***
- ***uint32_t TIM_ClearInputConfigTypeDef::ClearInputPrescaler***
  TIM Clear Input prescaler This parameter must be 0: When OCRef clear feature is used with ETR source, ETR prescaler must be off
- ***uint32_t TIM_ClearInputConfigTypeDef::ClearInputFilter***
  TIM Clear Input filter This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF

77.1.8 TIM_MasterConfigTypeDef

TIM_MasterConfigTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t MasterOutputTrigger***
- ***uint32_t MasterOutputTrigger2***
- ***uint32_t MasterSlaveMode***

Field Documentation

- ***uint32_t TIM_MasterConfigTypeDef::MasterOutputTrigger***
  Trigger output (TRGO) selection This parameter can be a value of ***TIM_Master_Mode_Selection***
- ***uint32_t TIM_MasterConfigTypeDef::MasterOutputTrigger2***
  Trigger output2 (TRGO2) selection This parameter can be a value of ***TIM_Master_Mode_Selection_2***
- ***uint32_t TIM_MasterConfigTypeDef::MasterSlaveMode***
  Master/slave mode selection This parameter can be a value of ***TIM_Master_Slave_Mode***
  Note:
  – When the Master/slave mode is enabled, the effect of an event on the trigger input (TRGI) is delayed to allow a perfect synchronization between the current timer and its slaves (through TRGO). It is not mandatory in case of timer synchronization mode.

77.1.9 TIM_SlaveConfigTypeDef

TIM_SlaveConfigTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t SlaveMode***
- ***uint32_t InputTrigger***
- ***uint32_t TriggerPolarity***
- ***uint32_t TriggerPrescaler***
- ***uint32_t TriggerFilter***

Field Documentation

- ***uint32_t TIM_SlaveConfigTypeDef::SlaveMode***
  Slave mode selection This parameter can be a value of ***TIM_Slave_Mode***
- ***uint32_t TIM_SlaveConfigTypeDef::InputTrigger***
  Input Trigger source This parameter can be a value of ***TIM_Trigger_Selection***
- ***uint32_t TIM_SlaveConfigTypeDef::TriggerPolarity***
  Input Trigger polarity This parameter can be a value of ***TIM_Trigger_Polarity***
- ***uint32_t TIM_SlaveConfigTypeDef::TriggerPrescaler***
  Input trigger prescaler This parameter can be a value of ***TIM_Trigger_Prescaler***
- ***uint32_t TIM_SlaveConfigTypeDef::TriggerFilter***
  Input trigger filter This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF

77.1.10 TIM_BreakDeadTimeConfigTypeDef

TIM_BreakDeadTimeConfigTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***uint32_t OffStateRunMode***
- ***uint32_t OffStateIDLEMode***

- ***uint32_t LockLevel***
- ***uint32_t DeadTime***
- ***uint32_t BreakState***
- ***uint32_t BreakPolarity***
- ***uint32_t BreakFilter***
- ***uint32_t BreakAFMode***
- ***uint32_t Break2State***
- ***uint32_t Break2Polarity***
- ***uint32_t Break2Filter***
- ***uint32_t Break2AFMode***
- ***uint32_t AutomaticOutput***

Field Documentation

- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::OffStateRunMode***
  TIM off state in run mode, This parameter can be a value of ***TIM_OSSR_Off_State_Selection_for_Run_mode_state***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::OffStateIDLEMode***
  TIM off state in IDLE mode, This parameter can be a value of ***TIM_OSSI_Off_State_Selection_for_Idle_mode_state***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::LockLevel***
  TIM Lock level, This parameter can be a value of ***TIM_Lock_level***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::DeadTime***
  TIM dead Time, This parameter can be a number between Min_Data = 0x00 and Max_Data = 0xFF
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::BreakState***
  TIM Break State, This parameter can be a value of ***TIM_Break_Input_enable_disable***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::BreakPolarity***
  TIM Break input polarity, This parameter can be a value of ***TIM_Break_Polarity***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::BreakFilter***
  Specifies the break input filter.This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::BreakAFMode***
  Specifies the alternate function mode of the break input.This parameter can be a value of ***TIM_Break_Input_AF_Mode***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::Break2State***
  TIM Break2 State, This parameter can be a value of ***TIM_Break2_Input_enable_disable***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::Break2Polarity***
  TIM Break2 input polarity, This parameter can be a value of ***TIM_Break2_Polarity***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::Break2Filter***
  TIM break2 input filter.This parameter can be a number between Min_Data = 0x0 and Max_Data = 0xF
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::Break2AFMode***
  Specifies the alternate function mode of the break2 input.This parameter can be a value of ***TIM_Break2_Input_AF_Mode***
- ***uint32_t TIM_BreakDeadTimeConfigTypeDef::AutomaticOutput***
  TIM Automatic Output Enable state, This parameter can be a value of ***TIM_AOE_Bit_Set_Reset***

77.1.11 __TIM_HandleTypeDef

__TIM_HandleTypeDef is defined in the stm32n6xx_hal_tim.h

Data Fields

- ***TIM_TypeDef * Instance***
- ***TIM_Base_InitTypeDef Init***
- ***HAL_TIM_ActiveChannel Channel***
- ***DMA_HandleTypeDef * hdma***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_TIM_StateTypeDef State***
- ***__IO HAL_TIM_ChannelStateTypeDef ChannelState***

- *__IO HAL_TIM_ChannelStateTypeDef ChannelNState*
- *__IO HAL_TIM_DMABurstStateTypeDef DMABurstState*

77.2 TIM Firmware driver API description

The following section lists the various functions of the TIM library.

77.2.1 TIMER Generic features

The Timer features include:

1. 16-bit up, down, up/down auto-reload counter.
2. 16-bit programmable prescaler allowing dividing (also on the fly) the counter clock frequency either by any factor between 1 and 65536.
3. Up to 4 independent channels for:
   – Input Capture
   – Output Compare
   – PWM generation (Edge and Center-aligned Mode)
   – One-pulse mode output
4. Synchronization circuit to control the timer with external signals and to interconnect several timers together.
5. Supports incremental encoder for positioning purposes

77.2.2 How to use this driver

1. Initialize the TIM low level resources by implementing the following functions depending on the selected feature:
   – Time Base : HAL_TIM_Base_MspInit()
   – Input Capture : HAL_TIM_IC_MspInit()
   – Output Compare : HAL_TIM_OC_MspInit()
   – PWM generation : HAL_TIM_PWM_MspInit()
   – One-pulse mode output : HAL_TIM_OnePulse_MspInit()
   – Encoder mode output : HAL_TIM_Encoder_MspInit()
2. Initialize the TIM low level resources :
   a. Enable the TIM interface clock using __HAL_RCC_TIMx_CLK_ENABLE();
   b. TIM pins configuration
      ◦ Enable the clock for the TIM GPIOs using the following function: __HAL_RCC_GPIOx_CLK_ENABLE();
      ◦ Configure these TIM pins in Alternate function mode using HAL_GPIO_Init();
3. The external Clock can be configured, if needed (the default clock is the internal clock from the APBx), using the following function: HAL_TIM_ConfigClockSource, the clock configuration should be done before any start function.

4. Configure the TIM in the desired functioning mode using one of the Initialization function of this driver:
   - HAL_TIM_Base_Init: to use the Timer to generate a simple time base
   - HAL_TIM_OC_Init, HAL_TIM_OC_ConfigChannel and optionally HAL_TIMEx_OC_ConfigPulseOnCompare: to use the Timer to generate an Output Compare signal.
   - HAL_TIM_PWM_Init and HAL_TIM_PWM_ConfigChannel: to use the Timer to generate a PWM signal.
   - HAL_TIM_IC_Init and HAL_TIM_IC_ConfigChannel: to use the Timer to measure an external signal.
   - HAL_TIM_OnePulse_Init and HAL_TIM_OnePulse_ConfigChannel: to use the Timer in One Pulse Mode.
   - HAL_TIM_Encoder_Init: to use the Timer Encoder Interface.
5. Activate the TIM peripheral using one of the start functions depending from the feature used:
   - Time Base : HAL_TIM_Base_Start(), HAL_TIM_Base_Start_DMA(), HAL_TIM_Base_Start_IT()
   - Input Capture : HAL_TIM_IC_Start(), HAL_TIM_IC_Start_DMA(), HAL_TIM_IC_Start_IT()
   - Output Compare : HAL_TIM_OC_Start(), HAL_TIM_OC_Start_DMA(), HAL_TIM_OC_Start_IT()
   - PWM generation : HAL_TIM_PWM_Start(), HAL_TIM_PWM_Start_DMA(), HAL_TIM_PWM_Start_IT()
   - One-pulse mode output : HAL_TIM_OnePulse_Start(), HAL_TIM_OnePulse_Start_IT()
   - Encoder mode output : HAL_TIM_Encoder_Start(), HAL_TIM_Encoder_Start_DMA(), HAL_TIM_Encoder_Start_IT().
6. The DMA Burst is managed with the two following functions: HAL_TIM_DMABurst_WriteStart() HAL_TIM_DMABurst_ReadStart()

Callback registration

The compilation define USE_HAL_TIM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_TIM_RegisterCallback() to register a callback. HAL_TIM_RegisterCallback() takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_TIM_UnRegisterCallback() to reset a callback to the default weak function. HAL_TIM_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID.

These functions allow to register/unregister following callbacks:

- Base_MspInitCallback : TIM Base Msp Init Callback.
- Base_MspDeInitCallback : TIM Base Msp DeInit Callback.
- IC_MspInitCallback : TIM IC Msp Init Callback.
- IC_MspDeInitCallback : TIM IC Msp DeInit Callback.
- OC_MspInitCallback : TIM OC Msp Init Callback.
- OC_MspDeInitCallback : TIM OC Msp DeInit Callback.
- PWM_MspInitCallback : TIM PWM Msp Init Callback.
- PWM_MspDeInitCallback : TIM PWM Msp DeInit Callback.
- OnePulse_MspInitCallback : TIM One Pulse Msp Init Callback.
- OnePulse_MspDeInitCallback : TIM One Pulse Msp DeInit Callback.
- Encoder_MspInitCallback : TIM Encoder Msp Init Callback.
- Encoder_MspDeInitCallback : TIM Encoder Msp DeInit Callback.
- HallSensor_MspInitCallback : TIM Hall Sensor Msp Init Callback.
- HallSensor_MspDeInitCallback : TIM Hall Sensor Msp DeInit Callback.
- PeriodElapsedCallback : TIM Period Elapsed Callback.
- PeriodElapsedHalfCpltCallback : TIM Period Elapsed half complete Callback.
- TriggerCallback : TIM Trigger Callback.
- TriggerHalfCpltCallback : TIM Trigger half complete Callback.
- IC_CaptureCallback : TIM Input Capture Callback.
- IC_CaptureHalfCpltCallback : TIM Input Capture half complete Callback.
- OC_DelayElapsedCallback : TIM Output Compare Delay Elapsed Callback.
- PWM_PulseFinishedCallback : TIM PWM Pulse Finished Callback.
- PWM_PulseFinishedHalfCpltCallback : TIM PWM Pulse Finished half complete Callback.

- ErrorCallback : TIM Error Callback.
- CommutationCallback : TIM Commutation Callback.
- CommutationHalfCpltCallback : TIM Commutation half complete Callback.
- BreakCallback : TIM Break Callback.
- Break2Callback : TIM Break2 Callback.
- EncoderIndexCallback : TIM Encoder Index Callback.
- DirectionChangeCallback : TIM Direction Change Callback
- IndexErrorCallback : TIM Index Error Callback.
- TransitionErrorCallback : TIM Transition Error Callback

By default, after the Init and when the state is HAL_TIM_STATE_RESET all interrupt callbacks are set to the corresponding weak functions: examples HAL_TIM_TriggerCallback(), HAL_TIM_ErrorCallback().

Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functionalities in the Init / DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the Init / DeInit keep and use the user MspInit / MspDeInit callbacks(registered beforehand)

Callbacks can be registered / unregistered in HAL_TIM_STATE_READY state only. Exception done MspInit / MspDeInit that can be registered / unregistered in HAL_TIM_STATE_READY or HAL_TIM_STATE_RESET state, thus registered(user) MspInit / DeInit callbacks can be used during the Init / DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_TIM_RegisterCallback() before calling DeInit or Init function.

When The compilation define USE_HAL_TIM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

77.2.3 Detailed description of functions

HAL_TIM_Base_Init

Function name

HAL_StatusTypeDef HAL_TIM_Base_Init (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_DeInit

Function name

HAL_StatusTypeDef HAL_TIM_Base_DeInit (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_MspInit

Function name

void HAL_TIM_Base_MspInit (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_MspDeInit

Function name

void HAL_TIM_Base_MspDeInit (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_Start

Function name

HAL_StatusTypeDef HAL_TIM_Base_Start (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_Stop

Function name

HAL_StatusTypeDef HAL_TIM_Base_Stop (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_Start_IT

Function name

HAL_StatusTypeDef HAL_TIM_Base_Start_IT (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_Stop_IT

Function name

HAL_StatusTypeDef HAL_TIM_Base_Stop_IT (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_Base_Start_DMA

Function name

HAL_StatusTypeDef HAL_TIM_Base_Start_DMA (TIM_HandleTypeDef * htim, const uint32_t * pData, uint16_t Length)

Function description

HAL_TIM_Base_Stop_DMA

Function name

HAL_StatusTypeDef HAL_TIM_Base_Stop_DMA (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_OC_Init

Function name

HAL_StatusTypeDef HAL_TIM_OC_Init (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_OC_DeInit

Function name

HAL_StatusTypeDef HAL_TIM_OC_DeInit (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_OC_MspInit

Function name

void HAL_TIM_OC_MspInit (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_OC_MspDeInit

Function name

void HAL_TIM_OC_MspDeInit (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_OC_Start

Function name

HAL_StatusTypeDef HAL_TIM_OC_Start (TIM_HandleTypeDef * htim, uint32_t Channel)

Function description

HAL_TIM_OC_Stop

Function name

HAL_StatusTypeDef HAL_TIM_OC_Stop (TIM_HandleTypeDef * htim, uint32_t Channel)

Function description

HAL_TIM_OC_Start_IT

Function name

HAL_StatusTypeDef HAL_TIM_OC_Start_IT (TIM_HandleTypeDef * htim, uint32_t Channel)

Function description

HAL_TIM_OC_Stop_IT

Function name

HAL_StatusTypeDef HAL_TIM_OC_Stop_IT (TIM_HandleTypeDef * htim, uint32_t Channel)

Function description

HAL_TIM_OC_Start_DMA

Function name

HAL_StatusTypeDef HAL_TIM_OC_Start_DMA (TIM_HandleTypeDef * htim, uint32_t Channel, const uint32_t * pData, uint16_t Length)

Function description

HAL_TIM_OC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_TIM_OC_Stop_DMA (TIM_HandleTypeDef * htim, uint32_t Channel)

Function description

HAL_TIM_PWM_Init

Function name

HAL_StatusTypeDef HAL_TIM_PWM_Init (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_PWM_DeInit

Function name

HAL_StatusTypeDef HAL_TIM_PWM_DeInit (TIM_HandleTypeDef * htim)

Function description

HAL_TIM_PWM_MspInit

Function name

Function description

77.3 TIM Firmware driver defines

The following section lists the various define and macros of the module.

77.3.1 TIM

TIM

TIM Automatic Output Enable

TIM_AUTOMATICOUTPUT_DISABLE

MOE can be set only by software

TIM_AUTOMATICOUTPUT_ENABLE

MOE can be set by software or automatically at the next update event (if none of the break inputs BRK and BRK2 is active)

TIM Auto-Reload Preload

TIM_AUTORELOAD_PRELOAD_DISABLE

TIMx_ARR register is not buffered

TIM_AUTORELOAD_PRELOAD_ENABLE

TIMx_ARR register is buffered

TIM Break2 Input Alternate Function Mode

TIM_BREAK2_AFMODE_INPUT

Break2 input BRK2 in input mode

TIM_BREAK2_AFMODE_BIDIRECTIONAL

Break2 input BRK2 in bidirectional mode

TIM Break input 2 Enable

TIM_BREAK2_DISABLE

Break input BRK2 is disabled

TIM_BREAK2_ENABLE

Break input BRK2 is enabled

TIM Break Input 2 Polarity

TIM_BREAK2POLARITY_LOW

Break input BRK2 is active low

TIM_BREAK2POLARITY_HIGH

Break input BRK2 is active high

TIM Break Input Alternate Function Mode

TIM_BREAK_AFMODE_INPUT

Break input BRK in input mode

TIM_BREAK_AFMODE_BIDIRECTIONAL

Break input BRK in bidirectional mode

TIM Break Input Enable

TIM_BREAK_ENABLE

Break input BRK is enabled

TIM_BREAK_DISABLE

Break input BRK is disabled

TIM Break Input Polarity

TIM_BREAKPOLARITY_LOW

Break input BRK is active low

TIM_BREAKPOLARITY_HIGH

Break input BRK is active high

TIM Break System

TIM_BREAK_SYSTEM_ECC_TCM

Enables and locks the Cortex-M55 TCM double ECC error signal connection to TIM1/8/15/16/17 break inputs

TIM_BREAK_SYSTEM_ECC_CACHE

Enables and locks the Cortex-M55 cache double ECC error signa connection to TIM1/8/15/16/17 break inputs

TIM_BREAK_SYSTEM_ECC_BACKUP_RAM

Enables and locks the Backup RAM ECC double error detection flag connection to TIM1/8/15/16/17 break inputs

TIM_BREAK_SYSTEM_PVD

Enables and locks the PVD signal connection to TIM1/8/15/16/17 break inputs

TIM_BREAK_SYSTEM_LOCKUP

Enables and locks the Cortex-M55 lockup signal connection to TIM1/8/15/16/17 break inputs

CCx DMA request selection

TIM_CCDMAREQUEST_CC

CCx DMA request sent when capture or compare match event occurs

TIM_CCDMAREQUEST_UPDATE

CCx DMA requests sent when update event occurs

TIM Channel

TIM_CHANNEL_1

Capture/compare channel 1 identifier

TIM_CHANNEL_2

Capture/compare channel 2 identifier

TIM_CHANNEL_3

Capture/compare channel 3 identifier

TIM_CHANNEL_4

Capture/compare channel 4 identifier

TIM_CHANNEL_5

Compare channel 5 identifier

TIM_CHANNEL_6

Compare channel 6 identifier

TIM_CHANNEL_ALL

Global Capture/compare channel identifier

TIM Clear Input Polarity

TIM_CLEARINPUTPOLARITY_INVERTED

Polarity for ETRx pin

TIM_CLEARINPUTPOLARITY_NONINVERTED

Polarity for ETRx pin

TIM Clear Input Prescaler

TIM_CLEARINPUTPRESCALER_DIV1

No prescaler is used

TIM_CLEARINPUTPRESCALER_DIV2

Prescaler for External ETR pin: Capture performed once every 2 events.

TIM_CLEARINPUTPRESCALER_DIV4

Prescaler for External ETR pin: Capture performed once every 4 events.

TIM_CLEARINPUTPRESCALER_DIV8

Prescaler for External ETR pin: Capture performed once every 8 events.

TIM Clear Input Source

TIM_CLEARINPUTSOURCE_NONE

OCREF_CLR is disabled

TIM_CLEARINPUTSOURCE_ETR

OCREF_CLR is connected to ETRF input

TIM Clock Division

TIM_CLOCKDIVISION_DIV1

Clock division: tDTS=tCK_INT

TIM_CLOCKDIVISION_DIV2

Clock division: tDTS=2*tCK_INT

TIM_CLOCKDIVISION_DIV4

Clock division: tDTS=4*tCK_INT

TIM Clock Polarity

TIM_CLOCKPOLARITY_INVERTED

Polarity for ETRx clock sources

TIM_CLOCKPOLARITY_NONINVERTED

Polarity for ETRx clock sources

TIM_CLOCKPOLARITY_RISING

Polarity for TIx clock sources

TIM_CLOCKPOLARITY_FALLING

Polarity for TIx clock sources

TIM_CLOCKPOLARITY_BOTHEDGE

Polarity for TIx clock sources

TIM Clock Prescaler

TIM_CLOCKPRESCALER_DIV1

No prescaler is used

TIM_CLOCKPRESCALER_DIV2

Prescaler for External ETR Clock: Capture performed once every 2 events.

TIM_CLOCKPRESCALER_DIV4

Prescaler for External ETR Clock: Capture performed once every 4 events.

TIM_CLOCKPRESCALER_DIV8

Prescaler for External ETR Clock: Capture performed once every 8 events.

TIM Clock Source

TIM_CLOCKSOURCE_INTERNAL

Internal clock source

TIM_CLOCKSOURCE_ETRMODE1

External clock source mode 1 (ETRF)

TIM_CLOCKSOURCE_ETRMODE2

External clock source mode 2

TIM_CLOCKSOURCE_TI1ED

External clock source mode 1 (TTI1FP1 + edge detect.)

TIM_CLOCKSOURCE_TI1

External clock source mode 1 (TTI1FP1)

TIM_CLOCKSOURCE_TI2

External clock source mode 1 (TTI2FP2)

TIM_CLOCKSOURCE_ITR0

External clock source mode 1 (ITR0)

TIM_CLOCKSOURCE_ITR1

External clock source mode 1 (ITR1)

TIM_CLOCKSOURCE_ITR2

External clock source mode 1 (ITR2)

TIM_CLOCKSOURCE_ITR3

External clock source mode 1 (ITR3)

TIM_CLOCKSOURCE_ITR4

External clock source mode 1 (ITR4)

TIM_CLOCKSOURCE_ITR5

External clock source mode 1 (ITR5)

TIM_CLOCKSOURCE_ITR6

External clock source mode 1 (ITR6)

TIM_CLOCKSOURCE_ITR7

External clock source mode 1 (ITR7)

TIM_CLOCKSOURCE_ITR8

External clock source mode 1 (ITR8)

TIM_CLOCKSOURCE_ITR9

External clock source mode 1 (ITR9)

TIM_CLOCKSOURCE_ITR10

External clock source mode 1 (ITR10)

TIM_CLOCKSOURCE_ITR11

External clock source mode 1 (ITR11)

TIM_CLOCKSOURCE_ITR12

External clock source mode 1 (ITR12)

TIM_CLOCKSOURCE_ITR13

External clock source mode 1 (ITR13)

TIM Commutation Source
